TERMS OF APPOINTMENT.—The appointments are pensionable, subject to a probationary period which varies from two to three years.

COURSES OF INSTRUCTION IN TROPICAL MEDICINE AND HYGIENE.—Selected candidates will normally be required to attend a course of instruction leading to the Diploma in Tropical Medicine and Hygiene before proceeding overseas.

DUTIES.—Although Medical Officers are appointed in the first instance for general service, there are opportunities for work in special branches of medicine and surgery, in public health, and in medical research.

Further particulars and forms of application may be obtained from the Director of Recruitment (Colonial Service), 2, Richmond Terrace, Whitehall, London, S.W.1.

IRAQ GOVERNMENT

APPOINTMENT OF BRITISH SURGICAL SPECIALISTS.

The Iraq Government invite applications from British Medical and Surgical Specialists (male) for the following vacant appointments.

1. OBSTETRICIAN AND GYNAECOLOGIST.

Duties: To be Professor of Obstetrics and Gynaecology in the Royal College of Medicine, Bagdad, and Chief of the Unit of Obstetrics and Gynaecology in the Royal Hospital, Bagdad.

Salary: Iraq Dinars 150 per mensem.

2. EAR, NOSE, AND THROAT SPECIALIST.

Duties: To be Lecturer on Ear, Nose, and Throat diseases in the Royal College of Medicine, Bagdad, and Chief of one of the Units for these diseases at the Royal Hospital, Bagdad.

Salary: Iraq Dinars 120 per mensem. In special circumstances if it is considered that the candidate's qualifications and experience justify it a salary in excess of this amount, but not exceeding 150 Dinars per mensem, may be granted.

3. GENERAL SURGICAL SPECIALIST.

Duties: To act as Surgical Specialist in any hospital of the Iraq Health Service as required and to assist in the teaching of Surgery in the Royal College of Medicine, Bagdad, if required.

Salary: Iraq Dinars 120 per mensem.

Candidates must be experienced in operative work and must hold a Specialist's diploma in their branch of work, such as F.R.C.S., M.C.O.G., or D.L.O.

Age must not exceed 45 years. Successful candidates will be required to enter into contracts for a period of five years. Consultant practice is allowed provided that it does not interfere with the performance of official duties. The teaching at the Medical College is in the English language.

One Iraq Dinar is equivalent to one Pound Sterling. Salaries will be subject to Iraq Income Tax which is:—150 dinars exempt, the next 150 dinars subject to 6% tax, and the remainder of the income 9%.

Forms of application and copies of the Form of Contract can be obtained from the Iraq Minister, the Royal Iraq Legation, 22, Queen's Gate, London, S.W. 7. Particulars as to the Provident Fund, leave, and passage allowances are given in the Form of Contract.

No application can be considered unless received on the prescribed form not later than February 18th.

UMIATA HOSPITAL BOARD.

SIR HENRY ELLIOT HOSPITAL.

APPOINTMENT OF SENIOR RESIDENT MEDICAL OFFICER.

Applications are invited from qualified Registered Medical Practitioners for the above-mentioned post. The salary attached to this position, which is whole-time, is at the rate of £600 per annum, plus free house, water, light and sanitation. A double-storied dwelling-house is shortly to be erected in which the successful applicant will be required to reside, but pending its completion he will be allowed an amount of £10 per month in lieu of quarters and incidental costs.

The successful applicant is to assume duty on July 1st 1938, and to enter into contract of service for three years (which may be renewed), the first year to be on probation.

The Hospital has 154 beds (22 European, 132 Native), but this accommodation will be increased by approximately 60 beds in the near future. Duties include assisting at operations, anaesthetics, radiology, the general ward work of a resident medical officer, lecturing to nurses and the general superintendence of the whole Hospital.

Applicants to state full particulars of:

(1) Their Medical and, in particular, Radiological and Surgical experience.

(2) Nationality, age, and whether married or single.

(3) Whether fully conversant with both English and Afrikaans.

Applications, with copies of three recent testimonials and health certificate, must be lodged with the undersigned not later than noon on March 15th, 1938.

Umtata, C. E. BEVAN, Secretary
Cape Province, South Africa.

BOROUGH OF BARKING.

PUBLIC HEALTH DEPARTMENT.

Applications are invited from Registered Dental Surgeons for the designated appointment of ASSISTANT DENTAL SURGEON.

Salary Scale: £450-£20-£550.

Particulars of duties and application form can be obtained from the undersigned, to whom such form must be returned not later than first post on Saturday, February 12th, 1938.

Town Hall, S. A. JEWERS, Town Clerk.
Barking, Essex.

COUNTY BOROUGH OF OLDHAM.

PUBLIC HEALTH DEPARTMENT.

TEMPORARY ASSISTANT MEDICAL OFFICER.

Applications are invited from registered medical practitioners for the post of Temporary Assistant Medical Officer of Health for the County Borough of Oldham. The duties are mainly in connexion with Diphtheria Immunization, but the officer appointed will be required to undertake such other duties in the Department as the Medical Officer of Health may direct. He will be required to reside in the Borough.

The salary will be at the rate of £500 per annum. Applications, stating age, and giving full particulars regarding training, qualifications and appointments held, should be forwarded to the Medical Officer of Health, Town Hall, Oldham, together with copies of three recent testimonials, so as to reach him not later than Tuesday, February 8th, 1938.

Town Hall, THOMAS ALKER, Town Clerk.
Oldham.
January 20th, 1938.

COUNTY BOROUGH OF WOLVERHAMPTON.

NEW CROSS HOSPITAL (350 Beds).

ASSISTANT MEDICAL OFFICER (RESIDENT).

Applications are invited from single gentlemen, duly qualified, for appointment as Assistant Medical Officer at the above Hospital, which contains Medical, Surgical, Maternity, Children's and Isolation Departments, and is modernly equipped. Experience in anaesthetics, a knowledge of Clinical Pathology, and previous Hospital experience will be deemed additional assets.

Salary will be at the rate of £200 per annum, with apartments, board, attendance, etc. The appointment will be limited to a term not exceeding one year.

Further information as to the duties, etc., may be obtained from the Medical Officer of the Hospital.

Applications, stating age, qualifications and nationality, together with copies of recent testimonials, should be addressed to A. G. ALDRIDGE, Public Assistance Officer, Stafford Street, Wolverhampton.

COUNTY BOROUGH OF BLACKBURN.

LADY ASSISTANT MEDICAL OFFICER OF HEALTH AND ASSISTANT SCHOOL MEDICAL OFFICER.

Applications are invited from duly registered women practitioners for the appointment of ASSISTANT MEDICAL OFFICER OF HEALTH AND ASSISTANT SCHOOL MEDICAL OFFICER to act under the direction and supervision of the Medical Officer of Health, who is also School Medical Officer. The salary is at the rate of £600 per annum, rising by annual increments of £25 to £700 per annum.

The person appointed must have had at least three years' post-graduate experience in the practice of her profession and special experience of midwifery and ante-natal work. Special post-graduate experience in the treatment of venereal diseases of children, and the possession of a registrable degree or diploma in Public Health, will be deemed additional qualifications.

Applications to be made on forms to be obtained from the Medical Officer of Health, Victoria Street, Blackburn, and returned to him not later than Saturday, February 12th, 1938, endorsed "Assistant Medical Officer of Health."

Canvassing directly or indirectly will be a disqualification. CHAS. S. ROBINSON, Town Hall, Blackburn. Town Clerk.
January 25th, 1938.

ROYAL DERBY AND DERBYSHIRE NURSING ASSOCIATION.

APPOINTMENT OF HONORARY OBSTETRIC PHYSICIAN TO THE NIGHTINGALE HOME.

The Board of Management invite applications to fill a vacancy on the staff of HONORARY OBSTETRIC PHYSICIANS. The duties include instruction of Pupil-Midwives.

Election will be by the Governors at a Special Meeting to be held on Thursday, February 17th, 1938.

Applications, stating qualifications and experience, with not more than three testimonials, should be sent on or before February 14th to the undersigned, from whom all particulars may be obtained. Canvassing not allowed.

By Order, JOHN COBB, Secretary.
Royal Nursing Institution.
London Road, Derby.
January 29th 1938.

CITY OF LEEDS

ASSISTANT MEDICAL OFFICER

Applications are invited from qualified and registered medical practitioners for the post of Assistant Medical Officer for maternity and child welfare. Applicants must have had not less than three years' postgraduate experience, including experience in general medicine and surgery and special experience in obstetrics and ante-natal work, and in the treatment of children's diseases and disease of women. Preference will be given to candidates possessing the D.P.H.

Under the present grading scheme of the Council, the commencing salary for the post is £500 per annum and the maximum salary £700, with annual increments of £25, subject to satisfactory service, and the first increment will take effect on April 1st, following the completion of twelve months' service.

The person appointed will be required to pass a medical examination and to contribute to the superannuation fund established under the Local Government and Other Officers' Superannuation Act, 1922. The appointment will be terminable by one month's notice on either side.

Form of application and particulars as to the duties of the appointment may be obtained from the undersigned. Applications, endorsed "Maternity and Child Welfare Officer," together with copies of three recent testimonials, must be delivered at the Health Department, 12, Market Buildings, Vicar Lane, Leeds, 1, not later than 10.30 a.m. on Saturday, February 19th, 1938. Canvassing in any form, either directly or indirectly, will be a disqualification.

J. JOHNSTONE JERVIS,
Medical Officer of Health.

COUNTY BOROUGH OF BLACKBURN

ASSISTANT MEDICAL OFFICER OF HEALTH

Applications are invited for the post of Assistant Medical Officer of Health (male), whose principal duties will be to act as Clinical Tuberculosis Officer for the Town and Resident Medical Officer of the Corporation Hospital, in which cases of tuberculosis and other infectious diseases are treated.

Applicants must not be less than 24 years of age and, subsequent to qualification, shall (1) have had at least three years' experience in the practice of their profession, (2) have spent in general clinical work a period of not less than eighteen months, of which not less than six months have been spent in a hospital as Resident Officer in charge of beds occupied by general medical or surgical cases, and (3) have received special training for a period of not less than six months in the diagnosis and treatment of tuberculosis.

Preference will be given to candidates who, in addition to the requirements mentioned above, hold a diploma in Public Health, and who have held a resident post in an Infectious Diseases Hospital. The salary will be £600 per annum, together with board and residence. Married quarters are not available.

A form of application and list of duties may be obtained from the Medical Officer of Health, Public Health Officer, Victoria Street, Blackburn, to whom applications, together with copies of three recent testimonials, endorsed "Assistant Medical Officer of Health," should be sent not later than noon on Saturday, February 19th, 1938.

Canvassing, directly or indirectly, will be a disqualification.

CHAS. S. ROBINSON,
Town Clerk.
January 25th, 1938.

NORFOLK COUNTY COUNCIL.

CLINICAL TUBERCULOSIS OFFICER.

Applications are invited for the appointment of a Clinical Tuberculosis Officer for the western area of the county. Applicants must have had considerable experience of tuberculosis, including dispensary, x-ray diagnosis, and artificial pneumothorax treatment.

Salary £750, rising, on satisfactory service, by annual increments of £25 to £937 10s. 6d. Travelling expenses in accordance with the Council's scale will also be paid.

The officer appointed will be on the staff of the County Medical Officer, must reside at a centre approved by the Council and devote his whole time to the work.

The appointment will be terminable by three months' notice by either side. The post will be a designated one under the Local Government and Other Officers' Superannuation Act, 1922, and the successful applicant will be required to pass a medical examination.

Application forms can be obtained from the County Medical Officer, Public Health Department, 29, Thorpe Road, Norwich, to whom they must be returned not later than February 19th, 1938.

H. C. DAVIES,
Clerk of the Council.
Thorpe Road, Norwich.
January 22nd, 1938.

ADMINISTRATIVE COUNTY OF NORFOLK.

ASSISTANT COUNTY MEDICAL OFFICER AND MEDICAL OFFICER OF HEALTH

for
Wells Urban District.
Dorchester Rural District.
Walsingham Rural District.

The Norfolk County Council and the District Councils concerned invite applications from medical practitioners holding a diploma in Public Health, or similar qualification, for the joint whole-time appointment of ASSISTANT COUNTY MEDICAL OFFICER and MEDICAL OFFICER OF HEALTH for the Urban District of Wells-on-the-Sea, and the Rural Districts of Dorchester and Walsingham. Population of area about 37,000, a further urban district (population 3,000) may be added later.

The salary for the combined appointment will be £600 per annum, with travelling expenses in accordance with the County Council's scale. The post will be designated under the Local Government and Other Officers' Superannuation Act, 1922, and the salary will be subject to the statutory deduction for this purpose. The successful applicant will be required to pass a medical examination.

The officer will act under the County Medical Officer as Assistant School Medical Officer, Medical Officer for Infant Welfare Centres, and will be required to perform such other duties as may be assigned to him by the County Council. As regards his duties as Medical Officer of Health he will be subject to the control of the District Councils concerned and be required to live at or near an approved centre in his area.

The appointment will be subject to three months' notice to be given, or received, by the Clerk of the County Council.

Applications must be made on the prescribed form, which can be obtained from the County Medical Officer, Public Health Department, 29, Thorpe Road, Norwich, to whom they should be returned, accompanied by copies of not more than three recent testimonials, not later than February 19th, 1938.

Canvassing in any form will be a disqualification.

H. C. DAVIES,
Clerk of the County Council.
W. A. WILLIAMSON,
Clerk to the Wells Urban District Council.
J. H. MARSHALL,
Clerk to the Dorchester Rural District Council.
A. E. KERRISON,
Clerk to the Walsingham Rural District Council.
January 31st, 1938.

SURREY COUNTY COUNCIL

ASSISTANT MEDICAL OFFICER

Applications are invited for the appointment of an Assistant Medical Officer (male). Applicants must possess a qualification in Public Health and have had experience in the medical inspection of School Children, in Maternity and Child Welfare, and in the examination and certification of mentally defective children. The officer appointed will be required to undertake such other Public Health duties as may be allocated to him. He will be on the staff of the County Medical Officer of Health, must reside in the County of Surrey, and devote his whole time to the work. Salary £600 per annum, rising by annual increments of £20 to £700 per annum. Travelling expenses in accordance with the Council's scale will be allowed.

The appointment will be subject to the approval of the Ministry of Health, and of the Board of Education, to the successful candidate passing a medical examination, to the provisions of the Local Government and Other Officers' Superannuation Act, 1922, and to the staffing regulations of the Council, which provide, *inter alia*, that appointments may be determined at any time by three months' notice.

Applications, stating age, qualifications and experience, together with copies of three recent testimonials, should be made on the prescribed forms, and sent to the County Medical Officer of Health, County Hall, Kingston-upon-Thames, from whom copies of the application form may be obtained, and to whom any enquiries relating to the appointment should be addressed.

Last day for the receipt of applications, Wednesday, February 16th, 1938.

Canvassing, directly or indirectly, will disqualify.

DUDLEY AUKLAND,
Clerk of the County Council.
Kingston-upon-Thames.
February 1st, 1938.

THE UNIVERSITY OF LIVERPOOL

The Council invites applications for the following posts:—Two DEVONSTATORSHIPS (ungraded) in PHYSIOLOGY. Salary £200 per annum. The appointments will take effect as from October 1st, 1938.

Applications should be received by the undersigned not later than April 1st, 1938, from whom further particulars may be obtained.

STANLEY DUMBELL,
Registrar.
February, 1938.

METROPOLITAN BOROUGH OF FULHAM

MATERNITY HOME AND CLINIC.

RESIDENT MEDICAL OFFICER AND ASSISTANT MEDICAL OFFICER FOR MATERNITY AND CHILD WELFARE.

Applications are invited from unmarried qualified medical practitioners of either sex, with special obstetric experience, for the appointment of Resident Medical Officer and Assistant Medical Officer for Maternity and Child Welfare at the Council's new Maternity Home and Clinic (25 Beds). The officer appointed will also have medical charge of certain ante-natal, post-natal, infant welfare and ultra violet light clinics, and experience in these and the possession of the Diploma in Public Health will be additional qualifications.

The scale of salary will be £550 per annum, rising by annual increments of £25 to £580 per annum, plus gratuity valued for superannuation purposes at £150 per annum. The commencing salary will be within the above scale at a point in accordance with the qualifications and experience of the person appointed as determined by the Council.

Detailed particulars of the terms and conditions of the appointment, together with a form of application, will be sent on receipt of a stamped, addressed, foolscap envelope.

Applications must be delivered to me not later than February 19th. Canvassing is strictly prohibited and will disqualify.

WILFRED TOWNEND,
Town Hall, Fulham, S.W.6. Town Clerk.

ADDENBROOKE'S HOSPITAL, CAMBRIDGE

Applications are invited for the post of House Surgeon. The appointment will be for six months from March 15th, 1938, but is terminable at an earlier date by one month's written notice on either side. Salary will be at the rate of £130 per annum with board, residence and laundry. Candidates (male) who must be unmarried and duly registered are requested to forward their applications, stating age, qualifications, etc., together with copies of not more than four testimonials, to the undersigned on or before Wednesday, February 23rd, 1938.

J. A. BEARDSALL,
Secretary-Superintendent.

CHILDREN'S HOSPITAL, NOTTINGHAM

Applications are invited for the post of RESIDENT HOUSE PHYSICIAN (woman). The salary will be at the rate of £150 per annum, with apartments, board and laundry. The appointment will be for six months, duties to commence on April 1st.

Applications, together with testimonials, stating age, qualifications and experience, to be sent to the Honorary Secretary, 1, King John's Chambers, Bridlemouth Gate, Nottingham, on or before Tuesday, February 15th. Selected candidates will be required to attend at the Hospital for a personal interview.

CHILDREN'S HOSPITAL, NOTTINGHAM

Applications are invited for the post of RESIDENT HOUSE SURGEON (woman). The salary will be at the rate of £150 per annum, with apartments, board and laundry. The appointment will be for six months, duties to commence on April 1st.

LANCASHIRE COUNTY COUNCIL. JUNIOR ASSISTANT MEDICAL OFFICER. Wrightington Hospital, Appley Bridge.

Applications are invited for the post of Junior Assistant Medical Officer (male, unmarried) for the Wrightington Hospital, which contains 206 beds for non-pulmonary tuberculosis (adults and children) and 20 beds for "combined" pulmonary and non-pulmonary cases. Salary £300 per annum, together with board, residence, and laundry.

The appointment will be for six months or for twelve months, as may be agreed upon. The medical staff consists of medical superintendent, two assistants, two consultant orthopaedic surgeons and other visiting surgeons. There are excellent facilities for reading for M.D.

Forms of application and conditions of appointment obtainable from Central Tuberculosis Officer, County Offices, Preston. Letters to be marked "Wrightington M.O."

Closing date February 17th, 1938
GEORGE ETHERTON,
Clerk of the County Council.
County Offices, Preston

ADMINISTRATIVE COUNTY OF CAMBRIDGE DEPUTY MEDICAL OFFICER OF HEALTH.

The Cambridgeshire County Council invite applications for the post of Deputy Medical Officer of Health for the County from duly qualified practitioners registered in the Medical Register as holders of a diploma in sanitary science, public health or State medicine.

The officer appointed will act under the direction of the Medical Officer of Health for the County (who is also School Medical Officer) in the general administration of public health and in other medical work of the Council, including that of the Education Authority. The duties will be mainly in connexion with school medical inspection, and experience in refraction and diseases of the eye is essential. The officer appointed must not engage in private practice or hold any other appointment.

The salary attached to the post is £600 per annum, rising by increments of £50 to £750 per annum. A car will be provided or an allowance made for travelling, but there will be no subsistence allowance within the County.

The post is subject to superannuation, and the selected candidate will be required to undergo a medical examination. The appointment will be terminable by three months' notice in writing on either side.

A form of application (with any further information desired) can be obtained from the Clerk of the County Council by sending a stamped addressed foolscap envelope. Applications must be received not later than February 28th, 1938.

Shire Hall, Cambridge. ASHLEY TABRUM,
Clerk of the Council.
January 25th, 1938.

BOROUGH OF EALING. RESIDENT ASSISTANT MEDICAL OFFICER.

Applications are invited from duly qualified medical men (single) with a Public Health qualification for the position of Resident Assistant Medical Officer. A candidate must have had experience in the treatment of cases of infectious disease at an Isolation Hospital. The duties will include the medical care of patients in the Chiswick and Ealing Isolation Hospital, South Ealing, and the medical inspection and treatment of school children at schools and health centres in the borough of Ealing. The person appointed will reside at the Isolation Hospital, where furnished rooms and board will be provided. He will be required to devote his whole time to the duties, and will not be allowed to engage in private practice. The salary will be at the rate of £350 per annum, rising by £25 per annum to a maximum of £550, plus board and residence, as indicated above and valued at £150 per annum.

A deduction of 5 per cent. will be made from the salary in accordance with the provisions of the Local Government and Other Officers' Superannuation Act, 1922, which has been adopted by the Council, and the appointment will be subject to passing the Council's medical examination in connexion therewith. Canvassing will be a disqualification.

Copies of the application forms and terms of appointment can be obtained from DR. THOMAS ORR, Medical Officer of Health, Town Hall, Ealing, W.5, to whom application, accompanied by copies of not more than three recent testimonials, must be delivered not later than February 10th.

Town Hall, Ealing, W.5. R. H. WANKLYN,
Town Clerk.

BOROUGH OF EALING. ASSISTANT MEDICAL OFFICER OF HEALTH.

Applications are invited from duly qualified medical men with a Public Health qualification for the position of Assistant Medical Officer of Health. A candidate must have had at least three years' experience in the practice of his profession. The person appointed will be required to carry out medical inspection of school children and child welfare work, and perform such other duties as may be allotted as Assistant to the Medical Officer of Health and School Medical Officer.

He will be required to devote his whole time to the duties, and will not be allowed to engage in private practice. The salary will be at the rate of £600 per annum, rising by £25 per annum to £700.

A deduction of 5 per cent. will be made from the salary in accordance with the provisions of the Local Government and Other Officers' Superannuation Act, 1922, which has been adopted by the Council, and the appointment will be subject to passing the Council's medical examination in connexion therewith. Canvassing will be a disqualification.

Copies of the application forms and terms of appointment can be obtained from DR. THOMAS ORR, Medical Officer of Health, Town Hall, Ealing, W.5, to whom application, accompanied by copies of not more than three recent testimonials, must be delivered not later than February 10th.

Town Hall, Ealing, W.5. R. H. WANKLYN,
Town Clerk.

DEPARTMENT OF HEALTH FOR SCOTLAND. APPOINTMENT OF REGIONAL MEDICAL OFFICERS.

The Department of Health for Scotland are prepared to receive applications from registered Medical Practitioners (men and women) for two posts of Regional Medical Officers to be employed on combined clinical and administrative duties in connexion with the National Health Insurance Medical Service and otherwise.

Qualifications.

Applicants must be medical practitioners of standing in the profession and with experience in hospital and general practice. They must be not more than 45 years of age on January 1st, 1938. Consideration will be given to extra diplomas in special branches of medicine.

Residence.

Regional Medical Officers are required to reside in such part of Scotland as the Department may determine.

Remuneration.

The rate of remuneration will be £800 by annual increments of £30 to £1,100 per annum.

Duties.

Regional Medical Officers are required to perform such duties as may be assigned to them from time to time by the Department, including:

- (a) Clinical work arising out of questions of incapacity for work or diagnosis and treatment among insured persons;
- (b) Administrative work in connexion with the insurance medical service.

Further particulars and forms of application may be had from the Secretary, Department of Health for Scotland, 125, George Street, Edinburgh, 2. Letters applying for forms of application should have the words "Regional Medical Officer" boldly written in the top left-hand corner of the envelope. Applications should reach the Department not later than February 28th, 1938. Any received after that date will not be considered.

DEPARTMENT OF HEALTH FOR SCOTLAND. APPOINTMENT OF MEDICAL OFFICERS

The Department of Health for Scotland are prepared to receive applications from registered medical practitioners (men and women) for two posts of Medical Officer.

Qualifications.

Applicants must hold the Diploma in Public Health or equivalent qualification, and weight will be given to expert knowledge and experience in relation to general and fever hospital services, food inspection, child and school health, and nutrition. Applicants must be not more than 45 years of age on January 1st, 1938.

Remuneration.

The rate of remuneration will be £750 by annual increments of £30 to £1,200 per annum.

Duties.

Medical Officers are required to devote their full time to the public service and to perform such duties as may be assigned to them by the Department from time to time.

Further particulars and forms of application may be had from the Secretary, Department of Health for Scotland, 125, George Street, Edinburgh, 2. Letters applying for forms of application should have the words "Medical Officer" boldly written on the top left-hand corner of the envelope. Applications should reach the Department not later than February 28th, 1938. Any received after that date will not be considered.

WEST SUSSEX COUNTY MENTAL HOSPITAL.

APPOINTMENT OF MEDICAL SUPERINTENDENT.

The Visiting Committee are desirous of receiving applications from duly registered and qualified Medical Practitioners for the office of Medical Superintendent from candidates whose age does not exceed forty-five.

The accommodation of the Hospital is for 1,045 patients.

The initial salary will be £1,100 a year, rising by two annual increments of £50 each to £1,200, with unfurnished house, the Committee paying rates and taxes, light washing, coals, and garden produce.

The candidate appointed will be required to enter upon his duties on or before June 1st, 1938, and to give up the whole of his time to the duties of his office, and not to attend to, or engage in, any professional or other business or employment except that of the Hospital, and not to have any interest, direct or indirect, in any establishment or house for the reception of any mental or other patients.

Applications, stating age, qualifications and experience, accompanied with copies of testimonials, not exceeding three (and which will not be returned) to be sent to me endorsed "Medical Superintendent" on or before February 23rd, 1938.

Personal canvassing is strictly prohibited.
G. H. D. PETERS,
Clerk to the Committee.

9, West Pallant,
Chichester, Sussex.
January 29th, 1938.

By Order of the Council.

G. C. ANDERSON, Secretary.

ANCOATS HOSPITAL, MANCHESTER.

CASUALTY OFFICER (lady or gentleman), twelve months' appointment. Applicants who have passed the Primary Fellowship Examination of one of the Royal Colleges of Surgeons will be preferred. Washing, etc. The successful applicant will do duty for the Resident Surgical Officer at alternate weekends and other scheduled times.

HOUSE SURGEON required (lady or gentleman), for the Ear, Nose and Throat Department, and to act as House Physician to one of the Honorary Physicians. Appointment for six months from March 1st. Salary £100 per annum, with board, apartments, washing, etc.

HOUSE SURGEON required (lady or gentleman), for the Orthopaedic Department. Appointment for six months from March 1st. Salary £100 per annum, with board, apartments, washing, etc. Applications for the above posts, stating age, qualifications, experience, if any, and full particulars, to be forwarded to the undersigned on or before Wednesday, February 9th, together with copies of three recent testimonials.

By Order of the Board,
HERBERT J. DAFFORNE,
Gen. Supt. and Secretary.

DEWSBURY AND DISTRICT GENERAL INFIRMARY, DEWSBURY.

The Senior Post is recognized by the Royal College of Surgeons (England).

Applications are invited for the post of **SENIOR HOUSE SURGEON** (male). Salary £200 per annum, with board, residence and laundry.

Also for the post of **SECOND HOUSE SURGEON** (male). Salary £150 per annum with similar emoluments. The duties are principally those of a House Physician and Casualty Officer. The Infirmary is a new Voluntary Hospital of 100 beds and has the usual Special Departments, with Visiting Consulting Specialists in attendance.

Applications, stating for which post, age, and hospital experience, together with copies of recent testimonials, to be sent as immediately as possible to my Office.

FRED SMITH,
Secretary-Superintendent.

CITY AND COUNTY OF BRISTOL. ASSISTANT MEDICAL OFFICER OF HEALTH.

The Council invite applications for a whole-time Assistant Medical Officer of Health. Are not exceeding 40 years. Salary £500 per annum, rising by annual increments of £50 to £700. The appointment will be subject to the provisions of the Local Government and Other Officers' Superannuation Act, 1922.

The duties will consist mainly of giving anaesthetics for Dental Surgeons, but he may also be required to work in any of the Corporation's Institutions, or to carry out any other work under the direction of the Medical Officer of Health.

Applications, which must be on the form provided for this purpose, should be accompanied by not more than three recent testimonials, and must be received by the undersigned not later than Wednesday, February 9th, 1938. Envelopes should be endorsed "Assistant Medical Officer of Health." Canvassing will disqualify.

Council House,
Bristol, 1
January 21st, 1938
IOSIAH GREEN,
Town Clerk.

CHESTERFIELD AND NORTH DERBYSHIRE ROYAL HOSPITAL. (220 Surgical and Medical Beds.)

APPOINTMENTS.—Contd.

THE ROYAL INFIRMARY, BRADFORD.

HOUSE SURGEON (male) wanted for March 1st. Eight months' appointment. Candidates must be single and legally qualified. Salary £150 per annum, with board, residence and washing. There are 345 beds and Resident Officers.

Applications, stating age, qualifications and previous experience, with copies of recent testimonials, should be sent to the undersigned at once. Dated February 1st, 1938.

H. TRUSSON,
House Governor and Secretary.

EAST SUSSEX COUNTY MENTAL HOSPITAL, HELLINGLY.

JUNIOR ASSISTANT RESIDENT MEDICAL OFFICER.

Applications are invited for the above post from duly qualified registered medical practitioners (unmarried).

Salary £150 a year, rising by four annual increments of £25 to £450, together with board, lodging, and attendance, valued for superannuation purposes at £90 a year, an additional £50 a year will be paid to any candidate appointed who holds the Diploma in Psychological Medicine, or a similar Diploma.

The appointment is subject to one month's notice on either side, and to the provisions of the Asylums Officers' Superannuation Act, 1929, giving particulars of previous experience, and copies of not more than three recent testimonials, should be addressed to the Medical Superintendent not later than February 17th, 1938.

HULL ROYAL INFIRMARY.

Applications are invited for the post of **SECOND CASUALTY OFFICER** (male) vacant February 12th.

Salary £150 per annum, plus board, residence and laundry.

In addition to carrying out duties in the Casualty Department the officer appointed will act as House Surgeon to one of the Honorary Assistant Surgeons, and will thus obtain Ward and Theatre experience. He will be eligible for promotion to a more senior post when a vacancy occurs.

The appointment will be for a period of six months, but will be terminable at any time by one month's notice on either side.

Applications, giving particulars of age, experience and nationality, together with copies of testimonials, should be addressed to the undersigned.

R. J. CARLESS
House Governor.

January 31st, 1938.

WILSON HOSPITAL, MITCHAM, SURREY. (72 Beds.)

RESIDENT MEDICAL OFFICER, male or female (required from March 31st next. Salary £150 per annum, with board, residence and laundry.

The appointment is for six months, renewable for a further six months at the discretion of the Committee. The Hospital is quite modern and exceptionally well equipped, and carries out work of a character which gives the Resident Medical Officer a considerable amount of experience.

Applications, with copies of three testimonials, stating age, qualifications and experience (particularly anaesthetics), should be sent to the Hon. Secretary, "Greenview," Lower Green, Mitcham, on or before Saturday, February 26th, 1938.

HARTLEPOOLS HOSPITAL, HARTLEPOOL. (96 Beds.)

Applications are invited for the post of **HOUSE SURGEON** (male). Salary £150 p.a. with board, residence and laundry.

The appointment is for six months (commencing February 25th).

Applications, stating nationality, age, qualifications and experience, should be addressed to the undersigned.

NORMAN O. DEANS,
Secretary.

WESTMORLAND SANATORIUM, Grange-over-Sands. (160 Beds.)

Applications are invited for the post of **JUNIOR ASSISTANT**. Salary £100 per annum, with board, lodging and laundry. Candidates should forward their applications, with full particulars and copies of recent testimonials, to the Medical Superintendent as soon as possible.

C. W. WATSON,
Secretary.

SUTTON AND CHEAM HOSPITAL, Sutton, Surrey. (75 Beds.)

Applications are invited for the post of **JUNIOR RESIDENT MEDICAL OFFICER** (male). Salary £100 per annum, with residence, board and laundry. The appointment will be for six months from April 1st next. Applications, giving full particulars as to age and qualifications, together with copies of three recent testimonials, should be sent to the Secretary not later than Monday, February 21st.

MERTHYR GENERAL HOSPITAL. (118 Beds.)

RESIDENT HOUSE SURGEON required for a period of six months at the rate of £150 per annum, with board and laundry. Applications, stating age, nationality, qualifications and accompanied by three (copies only) recent testimonials, should be addressed to the Secretary of the Merthyr General Hospital.

COUNTY BOROUGH OF HUDDERSFIELD. Bradley Wood Sanatorium for Pulmonary and Surgical Tuberculosis.

RESIDENT MEDICAL OFFICER AND ASSISTANT MEDICAL OFFICER OF HEALTH.

Applications are invited for the above appointments from registered Medical Practitioners (married or single), who have had special experience in the diagnosis and treatment of tuberculosis. A good knowledge of X-ray work is essential. Salary £600, rising to £750 per annum, plus house fire of rent. The post is designed for the purpose of the Local Government and Other Officers' Superannuation Act, 1922, and the person appointed will be required to satisfactorily pass a medical examination.

The engagement will be terminable on three months' notice from either side.

Applications should be accompanied by copies of not more than three testimonials, and addressed to **JOHN M. GIBSON, B.A., M.D., D.P.H.**, Medical Superintendent of Hospitals and Medical Officer of Health, so as to reach him not later than February 18th, 1938.

Forms of application are not provided. Town Hall, Huddersfield, February, 1938. SAMUEL PROCTOR, Town Clerk.

COUNTY BOROUGH OF SOUTHERNDON-SEA.

SOUTHERND MUNICIPAL HOSPITAL.

The Health Committee of the Town Council invite applications for the appointment of an **ASSISTANT MEDICAL OFFICER** (Grade 2) at their Municipal Hospital situated at Rochford, Essex (Beds. 475). Salary £250 per annum, with full residential emoluments valued for superannuation purposes at £100 per annum.

The duration of appointment is limited to one year. Applicants must have had previous experience in the administration of Anaesthetics.

Applications, on forms to be obtained from the Medical Superintendent, Southernnd Municipal Hospital, Rochford, Essex, should be returned to him on or before Monday, February 21st, 1938.

Town Clerk's Office, H. J. WOODOOD, Southend-on-Sea. Town Clerk.

DERBYSHIRE ROYAL INFIRMARY, DERBY. (General Hospital, 362 Beds.)

Applications are invited for the following posts:—**HOUSE SURGEON FOR GYNAECOLOGICAL DEPARTMENT.**

Incoming partner should preferably be a graduate of Oxford or Cambridge, must have held hospital appointments and be experienced in surgery. Excellent hospital. Share worth about £1,000 (or more) at two years' purchase with good prospects of increase.

2 LONDON, S.E.2.—Old-established PRACTICE in growing suburban district. Receipts average over £1,500 p.a. (appointments worth about £100 and panel over 1,050). Visits 3/6 to 6/-. Semi-detached corner house (3 bedrooms), with separate surgery accommodation, garage and small garden, for sale. Premium two years' purchase.

3 HOME COUNTIES.—PARTNERSHIP in good-class Practice, about £3,000 p.a., in favourite market town. Small select panel. Visits 5/- to £1 1s. Charming modern labour-saving residence (5 bedrooms, etc.), garage and beautifully stocked garden. Price £3,000. Very good society. Scope. Premium one-half share two years' purchase.

4 LONDON, N.7.—Old-established mixed PRACTICE, about £1,365 p.a., in populous district. Panel about 400. Visits 3/6 and 5/-, majority. Semi-detached corner house (5 bedrooms), with small garden. Rent £100 p.a. Very good scope. Premium two years' purchase.

5 MIDDLESEX.—Medical Woman's PRACTICE in rapidly growing residential district within 15 miles of London. Cash receipts, 1937, £528. Panel 69. Excellently situated modern house (5 bedrooms), with large garage and garden. Rent £125 p.a., or might be sold. Ample scope. District rapidly increasing. Premium £750.

6 S. COAST.—Old-established middle-class PRACTICE, averaging £1,200 p.a., in first-rate residential town and health resort. Small panel. Visits 5/- to 15/-. House (7 bedrooms), to rent at £120 p.a. Scope. Premium two years' purchase.

7 E. COAST.—PARTNERSHIP in middle-class Practice, doing nearly £4,000, in progressive, rapidly growing town, within 75 miles of London. Panel about 800. House (8 bedrooms), with garage and small garden. Price £2,500, or rent £120 p.a. Scope for increase. Good hospital. Three-eighths share at first at two years' purchase.

8 S.W. OF ENGLAND.—FOURTH PARTNER required in mixed country town Practice of nearly £6,800 p.a. Panel 4,600. Share worth about £1,100 p.a. at two years' purchase. Partner must be young and have made special study of medicine. Preliminary Assistantship.

9 S.E. COAST.—PARTNERSHIP in non-dispensing Practice, about £4,500 p.a. Panel 1,400. Suitable house would be available. One-fifth share at first at two years' purchase. Preliminary Assistantship. Scotsman preferred.

10 LONDON, W.2, and W.6.—Non-dispensing and non-panel PRACTICES run by two men in partnership. Receipts about £1,150 each practice. Premium two years' purchase and £1,000 respectively.

11 SURREY.—PARTNERSHIP in Practice, averaging £5,000 p.a., in residential district, about ten miles from London. Panel 3,000. House could be obtained. One-fifth share at two years' purchase. Preliminary Assistantship.

12 LONDON, N.W.—Steadily increasing PRACTICE in growing residential district within 14 miles of London. Receipts last year just over £700. Panel 60/70. Very attractive detached house (4 bedrooms), with good garden and garage, for sale or rent at £120 p.a. Branch close by to rent. Premium £1,250, or near offer.

13 N. WALES.—Country PRACTICE within easy distance of coast. Receipts average £2,000 p.a., including appointments and panel worth nearly £900 p.a. Exceptionally convenient house (6 bedrooms), electric light, etc. Price £1,500. Premium for practice, £3,500.

14 LONDON, E.C.—City PRACTICE doing about £300 p.a. No visiting, panel or midwifery. Premises to rent at £135 p.a. Premium £500.

15 SURREY.—PARTNERSHIP in old-established PRACTICE, averaging over £2,800 p.a., in outlying suburban district on the Thames. Small panel. Visits 5/- upwards. Outgoing partner's house (5 bedrooms, etc.), could be purchased if desired. One-third share at two years' purchase.

16 MIDLANDS, Cathedral City.—Old-established non-dispensing PRACTICE, averaging £1,550 p.a. Small panel. Visits 6/- to 10/6. Convenient house (about 6 bedrooms), in best residential part to rent at £65 p.a. Excellent prospects for one experienced in clinical pathology. Premium one and a-half years' purchase.

17 DEATH VACANCY.—CUMBERLAND.—Old-established good-class non-dispensing PRACTICE, over £700 p.a., in rapidly growing town. No panel. Large house for sale or rent. Good scope.

18 S. OF ENGLAND.—SURGICAL PARTNER required in good-class Practice in first-rate residential district. Applicant should be aged 30/35 or thereabouts, must hold the English Fellowship and be prepared to do some general practice. Modern up-to-date hospital. Share about £1,000 p.a. at first at two years' purchase.

19 BRITISH WEST INDIES.—SURGICAL PRACTICE in favourite town. Cash receipts, 1937, £1,900. Fine opportunity for experienced surgeon. Well-equipped nursing homes, X-ray and laboratory facilities. Rent of consulting rooms £5 monthly, and house £12 monthly. All kinds of sport. Premium £800.

20 LANCASHIRE COAST.—NUCLEUS OF PRACTICE, averaging £245 p.a., offering excellent scope for increase. Not much panel. Good house (5 bedrooms), for sale. Suit either medical man or woman. Premium £500, to include drugs, instruments, etc., etc.

21 EALING.—PRACTICE in rapidly developing district. Cash receipts, 1937, £510. Panel 710, increasing. Small corner house (3 bedrooms), with garage and garden. Rent £78 p.a. Premium £750.

22 S.E. COAST.—Old-established middle and working-class PRACTICE, about £950 p.a., in favourite summer resort. Clubs worth about £130 and panel about 1,400. Detached corner house (5 bed and dressing-rooms), with large garage and about half-acre of garden, for sale. Scope. Premium one and three-quarter years' purchase.

23 N. WALES.—Sound old-established PRACTICE, about £1,500 p.a., in industrial village with beautiful surrounding country. (Appointments and panel return about £1,000 p.a.). Detached house (4 bedrooms), garage and garden. Price freehold, £2,000. Premium 1½ years' purchase.

The maximum commission payable on the sale of any Practice or Partnership in Great Britain placed exclusively in the hands of this Agency is £50 (fifty pounds), which sum covers goodwill, drugs, surgery fittings, fixtures and furniture, instruments and book debts, but not house property. Schedule of Terms will be forwarded on application.

Accountancy and legal services furnished by the Agency, where desired, at moderate inclusive charges. No charge is made to Principals for the introduction of Locum Tenens or Assistants.

- BORDERS OF CAMBS. AND NORFOLK.**—Old-established country PRACTICE producing between £1,500 and £1,600 p.a., including panel of about 800 and appointments worth nearly £200 p.a. Good house in nearly an acre of garden (3 reception, 6 bedrooms, Professional accommodation, etc., electric light, garage). Rent on lease £70 p.a. Premium 2 years' purchase. Illness reason for sale.
- WEST LONDON.**—LOCK-UP PRACTICE.—Established some years and producing between £700 and £800 p.a., £600 from panel. Good scope. Low expenses. Inclusive rent of surgery premises £52 p.a. Premium 2 years' purchase.
- LONDON—WESTERN DISTRICT.**—Old-established PRACTICE held by vendor 12 years. Gross cash receipts last year £2,338, this year at rate of about £2,700 p.a. Panel of 1,450 to 1,500. House in good position on rental. Premium 2 years' purchase.
- SOUTH DEVON—COAST TOWN.**—Well-established PRACTICE producing last year over £1,000 (this year at rate of about £1,200 p.a.). Freehold house with 2 reception, 6 bedrooms, etc., for sale or might rent. Premium 14 years' purchase.
- SOUTH-WEST COUNTY.**—A ONE-SIXTH SHARE is offered in old-established Practice producing nearly £7,000 p.a. Incoming partner must have made a special study of medicine and preferably hold the M.R.C.P. or have held a medical registrarship. Short preliminary assistantship. Suitable 2 years' purchase.
- PARTNERSHIP.**—A ONE-HALF SHARE in producing over £3,000 p.a. Large panel. Very good Premium 2 years' purchase.
- A QUARTER SHARE** (with increase later) ship of about 3 months is offered in old-established Practice producing over £4,600 p.a. With substantial Panel and good appointments. Very nice house available on rental at £50 p.a. Premium 2 years' purchase.
- MIDDLESEX**—Recently established PRACTICE producing £700 p.a., with considerable scope. Very nice house on rental. Premium £1,250 or near offer.
- LONDON, EAST.**—Exceptionally sound chiefly working-class PRACTICE producing about £1,200 p.a., over £1,000 from Panel and appointments. Suitable house, rent £100 p.a.
- NEAR BIRMINGHAM.**—A ONE-THIRD SHARE (after preliminary assistantship) is offered in sound steadily increasing mixed-class Practice producing £3,700 p.a. Panel of nearly 5,000. Premium 2 years' purchase.
- LONDON, SOUTH-WEST.**—Middle and working-class PRACTICE. Receipts last year £705 p.a. Panel of 940. Suitable house, rent £75 p.a. Premium 2 years' purchase or near offer.
- PARTNERSHIP.**—A TWO-FIFTHS SHARE, with increase to one-half later, is offered in old-established good practice in this about 70 miles of London. Gross cash receipts for past including large panel. Moderate expenses accommodation and all modern conveniences. Premium 2 years' purchase or might be rented. Premium 2 years' purchase.
- NORTH WALES.**—(Welsh not essential).—Old-established unopposed country PRACTICE in very pleasant district averaging for past 3 years approximately £2,000 p.a., of which over £600 p.a. is from panel and about £285 from appointments and clubs. Very convenient house in excellent repair, with electric light, garage, etc. Price for freehold, £1,500. Premium £3,600. Partnership introduction will be given.
- LIVERPOOL.**—Old-established PRACTICE producing about £1,500 p.a., including panel of 1,300 and appointments worth about £170 p.a. Good house in excellent position. Premium for Practice and house £3,500 (for house might be rented).
- SURFURY—DEVELOPING TOWN.**—Increasing PRACTICE producing for last year £1,400 p.a. Panel of about 450 or smaller house available on rental at £45 p.a. Premium 2 years' purchase.
- SOUTH-WEST OF ENGLAND.**—A ONE-HALF SHARE is offered in PRACTICE producing £1,400 p.a., but believed to be capable of considerable increase with the aid of an energetic partner. Panel of about 1,100 patients. Very good house with 2 reception, 4 bedrooms, etc., and all modern conveniences. Garden of about 1 acre. Premium for share and house, £2,500.
- NORTHERN OUTSKIRTS OF LONDON.**—PARTNERSHIP.—A NINE-TWENTIETHS' share (after preliminary assistantship) is offered in well-established Practice. Receipts for last year stated to be £2,162 p.a. Panel of 1,900 patients, and appointments worth about £200 p.a. Suitable house with 2 reception, 3 bedrooms, etc. Premium £1,800.
- NORTH LONDON.**—Old-established mixed-class PRACTICE, averaging for past two years about £2,800 p.a. Panel of over 2,600. Suitable house with 2 reception, 4 bedrooms, small garden. Rent on lease £104 p.a. Premium 14 years' purchase.
- ANCY.**—Better-class non-panel PRACTICE, house can be rented. Offers invited.
- SCOTLAND.**—CITY.—Old-established non-dispensing PRACTICE producing £1,500 p.a., including £540 from Panel and £70 from 11 years' purchase or near offer.
- ION.**—Long-established good general class PRACTICE producing over £3,000 p.a., with a full panel. Good house with ample accommodation, garden and garage. Freehold for sale or might be rented. A good introduction will be given.
- BRITISH WEST INDIES.**—Better-class PRACTICE producing about £1,750 p.a. Fees 5/- to 2 guineas. Modern house with all conveniences can be purchased or rented.
- ESSEX COAST.**—Middle-class PRACTICE averaging £600 p.a. Considerable scope as receipts have declined through vendor's ill-health. Panel of about 300. Suitable house, garden and garage. Premium £1,000.
- WITHIN 12 MILES OF CHARING CROSS.**—Steadily increasing PRACTICE producing last year over £1,650. Panel of over 1,000. Easily worked. Low expenses. Compact house, garden and garage. Premium 2 years' purchase.
- SOUTH COAST SEAPORT.**—Old-established mixed-class PRACTICE producing for past year over £3,000. Panel about 1,600. Various appointments. Well situated modern house, 3 reception, 5 bedrooms. Central surgery rented at £60 p.a., part sublet. Premium 2 years' purchase.
- SOUTH COAST—FAVOURITE TOWN.**—PRACTICE producing over £1,700 p.a. Panel of about 1,500 p.a. Scope for surgery. Prospect of hospital Suitable house with garden and garage on lease. to include book debts and drugs.
- DORSET COAST—PARTNERSHIP.**—A ONE-THIRD SHARE with increase later in a well-established Practice averaging about £3,000 p.a. Panel of over 2,700 and P.M.S. about 1,000. Various appointments producing £250-300 p.a. Low expenses. Suitable house with 5 bedrooms, etc., can be purchased or rented. Premium 2 years' purchase.
- NORTH LONDON.**—Well-established middle and working-class PRACTICE producing about £600 p.a., but offering considerable scope, especially for Panel, which has only recently been started. Suitable accommodation available on rental. Reasonable offer for quick sale, vendor taking up appointment.
- NORTH LONDON SUBURB.**—Recently established PRACTICE in fast developing area. Receipts last year about £720, including Panel of about 200 patients. Architect-built modern house with ample accommodation. Freehold for sale. Premium £850 or near offer.
- GLOS.**—Sound old-established PRACTICE in beautiful country district averaging for past 4 years about £1,300 p.a. Panel over 1,100. Appointments about £80 p.a. Good house in own grounds. Freehold for sale. Premium 2 years' purchase.
- LONDON, EAST.**—Exceptionally sound old-established PRACTICE in populous area averaging for past 3 years over £2,240 p.a. Panel of approximately 3,500. Suitable house with excellent professional accommodation can be rented at £75 p.a.
- LANCS.—SEASIDE RESIDENTIAL TOWN.**—Easily worked, mostly non-dispensing PRACTICE producing about £1,000 p.a., including panel of about 325. Low expenses. Suitable house available with consulting and waiting rooms, 2 reception, 3 bedrooms, maid's room, etc. Large garden. Garage. For sale or can be rented. Premium 14 years' purchase.
- LEEDS.**—PARTNERSHIP with succession in 6 or 12 months. A 2 1/2% share is offered in an old-established Practice which has been held by the vendor, who is now specialising, for the past 2 years. Receipts for last year amounted to £1,176, including £492 from a Panel of about 1,150 patients. Suitable house available, freehold £900. Premium 14 years' purchase.
- WEST OF ENGLAND.**—A ONE-THIRD SHARE in a residential town. A ONE-THIRD SHARE is offered in a better middle-class Practice at present £1,000 p.a. Panel of 300 patients. Fees 5/- to 21/-. Flat available in vendor's house for single man. Rent £40 p.a., inclusive of rates.
- NORTH WALES.**—Good-class long-established PRACTICE in very attractive residential and seaside resort. Cash receipts for last 16 years over £1,200 every year. Panel 425. Good house with 2 small gardens to rent or purchase freehold. Socially very pleasant. Premium £1,800.
- HERTS.**—Country town on outskirts of London.—Very old-established PRACTICE held by vendor for 30 years. Gross cash receipts about £1,000 p.a., including Panel of 600 patients. Nice house with 2 reception, 4 bedrooms, good garden on rental. Premium 2 years' purchase.
- EAST ANGLIA.**—Within reach of two good towns. Old-established unopposed Country PRACTICE averaging over £1,000 p.a., including Panel producing over £450 p.a. Low expenses. Detached house with 2 stories and 5 bedrooms, etc. Rent £70 p.a. Premium £1,750.
- NORTH CORNWALL.**—Country PRACTICE in picturesque district near coast and within easy reach of two good towns. Stated to produce nearly £1,000 p.a., including Panel of £320.
- WITHIN 25 MILES OF LONDON.**—PARTNERSHIP, with surgical scope. A one-fourth share, with increase later, is for disposal in an old-established Practice, producing about £4,800 p.a. Fees 3/6 to 21/-. A suitable house can be secured. Incoming partner must have a Fellowship, be experienced and not over 35 years of age. A prelim. assistantship is offered.
- WEST COAST.**—Well-established PRACTICE, producing about £1,900 p.a., including Panel of 1,450. Suitable house on rental at £50 p.a. Premium 14 years' purchase.
- SURGICAL PARTNERSHIP** in delightful district within easy reach of London. A fifth partner is required in an old-established Practice. There is little visiting done under 10/6, although the patients come from all classes. Incoming partner, who must hold the Fellowship, would do all the surgery for the firm, but must be prepared to do general practice at £22 Choice of houses.

The Agency has made arrangements for special facilities, on very favourable terms, to be afforded to approved purchasers for the advance of part of the premium for any suitable practice or partnership. Full details on application.

ERGOMETRINE

The rapidly-acting ergot alkaloid

Induces rapid contraction of the uterus during the puerperium. Has a pronounced action on post-partum hæmorrhage.

By mouth. Dose—0.5 mgm. to 1 mgm.

TRADE MARK 'TABLOID' BRAND ERGOMETRINE
0.5 mgm.

TRADE MARK 'WELLCOME' BRAND SOLUTION OF ERGOMETRINE
0.5 mgm. in 2.5 c.c.

By Injection

TRADE MARK 'TABLOID' BRAND HYPODERMIC ERGOMETRINE
0.5 mgm. For Intramuscular Injection
0.125 mgm. For Intravenous Injection

TRADE MARK 'HYPOLOID' BRAND ERGOMETRINE
0.5 mgm. in 1 c.c. For Intramuscular Injection
0.125 mgm. in 1 c.c. For Intravenous Injection

Kymographic tracings illustrating action of ERGOMETRINE on the human uterus

Ergometrine 0.5 mgm. orally:
Effect in 6½ to 8 minutes

Ergometrine 0.5 mgm. intramuscularly:
Effect in 3½ to 4½ minutes

Ergometrine 0.15 mgm. intravenously:
Effect in less than 1 minute

TRADE MARK 'WELLCOME' BRAND

ERGOTOXINE ETHANESULPHONATE

For prolonged effect during the puerperium. Originated and introduced by Burroughs Wellcome & Co.

For prices and descriptive notes, see WELLCOME'S MEDICAL DIARY

HEILBRUNN'S

NEW

Outline of General Physiology

From THE LANCET Review

"Prof. Heilbrunn's object here is to provide an account of contemporary general physiology, and to include such references to original literature as will enable the reader to follow into further detail the subjects with which it deals. The book arose out of the author's teaching experience and the needs of his own students, especially those who have carried on research with him; it represents a mine of valuable up-to-date information and must have cost a fabulous amount of hard work. The style is clear and searching, the examples well chosen, and the whole field thoroughly well covered. The references alone should prove very valuable. This is the kind of general physiology that would have delighted Claude Bernard or Sir William Bayliss, and in fact is a modern presentation of that aspect of the subject to which they, in their own times, contributed so much.

We congratulate the author on his splendid work, and would prophesy that his modest hope that 'the book may have sufficient appeal to warrant a second edition' will be realised."

Octavo of 603 pages, illustrated. By L. V. HEILBRUNN, Associate Professor of Zoology in the University of Pennsylvania. Cloth, 21s. net.

NEW

TUFT'S CLINICAL ALLERGY

NEW

A book that discusses allergy and its relation to the diagnosis and treatment of everyday diseases in a decidedly practical manner—that brings to virtually all fields of practice a new and refreshing knowledge of allergy and its application.

The LANCET says it is

"An Able and Readable Presentation of the Subject"

Octavo of 711 pages, illustrated. By LOUIS TUFT, M.D., Chief of Clinic of Allergy and Applied Immunology, Temple University Hospital. Introduction by JOHN A. KOLMER, M.D., Dr.P.H., D.Sc., LL.D., L.H.D., Professor of Medicine, Temple University. Cloth, 36s. net.

NEW

THE CEREBROSPINAL FLUID

NEW

It is the purpose of this book to present facts. It is not written to advance a theory of physiology, or stress the merits of any single test. It represents an honest effort to correlate recognized and well tried tests, performed under standard and personally observed conditions.

The IRISH JOURNAL OF MEDICAL SCIENCE says it is

"An Invaluable Summary of the Findings in 21,000 Fluids"

Octavo of 333 pages, illustrated. By H. HOUSTON MERRITT, M.D., Assistant Professor of Neurology, Harvard Medical School; Director of the Cerebrospinal Fluid Laboratory, Boston City Hospital; and FRANK FREMONT-SMITH, M.D., formerly Assistant Professor of Neuropathology, Harvard Medical School; formerly Director of the Cerebrospinal Fluid Laboratory, Boston City Hospital. With a Foreword by JAMES B. AYER, M.D. Cloth, 22s. 6d. net.

NEW

DISEASES OF THE LARYNX

NEW

Deals with the practical diagnosis and treatment, both operative and non-operative, of diseases of the larynx. It is new throughout,—in text and in illustration—emphatically not a restating of existing literature.

The BRITISH MEDICAL JOURNAL says that

"Every Page is Pervaded by Immense Clinical Experience and Wisdom"

Octavo of 555 pages, with 221 illustrations, including 11 plates in colour. By CHEVALIER JACKSON, M.D., Sc.D., LL.D., F.A.C.S., Professor of Bronchoscopy and Esophagoscopy; and CHEVALIER L. JACKSON, A.B., M.D., M.Sc.(Med.), F.A.C.S., Professor of Clinical Bronchoscopy and Esophagoscopy, Temple University, Philadelphia. Cloth, 55s. net.

NEW (4th)
EDITION

CECIL'S TEXTBOOK OF MEDICINE

NEW (4th)
EDITION

Remade and drastically revised throughout, the New (4th) Edition will prove a worthy successor to past editions of this work because it includes the new things in medicine—to-day's tried and tested therapeutic agents and methods.

The BRITISH MEDICAL JOURNAL says it is

"A Good Straightforward Text-Book, Clearly Written, Full of Facts"

Octavo of 1,614 pages, illustrated. By 140 Authorities. Edited by RUSSELL L. CECIL, M.D., Professor of Clinical Medicine, Cornell University Medical College. Cloth, 40s. net.

W. B. SAUNDERS COMPANY, Ltd., 7, Grape Street, London, W.C.2

J. & A. CHURCHILL

PROGRESS IN SURGERY

EIGHTH EDITION.

Two Volumes.

36s. each.

Vol. I. 435 Illustrations, 38 in Colour.

Vol. II. 514 Illustrations, 4 in Colour.

THE OPERATIONS OF SURGERY

R. P. ROWLANDS, M.S., F.R.C.S.,
late Surgeon to Guy's Hospital;

By
and

Cassell and Company, Ltd., La Belle Sauvage, London, E.C. 4

NEW (FIFTH) EDITIONTHIS DAY**OPERATIVE GYNECOLOGY**

By HARRY STURGEON CROSSEN, M.D., and ROBERT JAMES CROSSEN, M.D.

FIFTH EDITION, ENTIRELY REVISED AND RESET.

Large Octavo, 1,076 pages, with 1,264 Illustrations, including 3 Coloured Plates.

Cloth.

Price 52s. 6d. net.

The six years since the last edition of this work constitute a period of unusual activity in searching out the fundamentals of gynecologic physiology and structure and in applying such knowledge to the cure of diseased conditions. This intensive study has extended also to our therapeutic resources, giving a much better understanding of their possibilities. This new edition has been extensively rearranged and rewritten to cover this new knowledge. About 260 new illustrations have been added.

NEW (FIFTH) EDITIONJUST READY**A PRACTICAL TREATISE ON DISEASES OF THE SKIN**

By OLIVER S. ORMSBY, M.D.

1938 has started and again you are confronted with the question: What am I doing with all my journals and periodicals which are accumulating week by week? Our "Easibinder" has answered that question and since being on the market less than two years, thousands of Professional Men and Women have adopted the "Easibind System."

For some reason or other we have not had the pleasure of receiving your esteemed order. Our 1938 advertising campaign is appealing to every reader who has not seen our binder to be good enough to fill out the coupon below. We can afford, backed by the efficiency of our "Easibinder," to make the undermentioned offer, because we know that once you have inspected our binder you will never do without the "Easibind System."

***Testimonial from Doctor**

Stratford-upon-Avon.

November 20th, 1937

Many thanks for the binding cases safely received on Friday. I am most pleased with them in every possible way, and am writing now to order more to bind my issues up to date . . . I need hardly say that I shall recommend to friends who have periodicals to bind; I only wish they had been available before, as I have not seen a more suitable way of dealing with them.

This letter is one of the many hundreds received.

Night and Day

NIGHT and day the doctor must be at the beck and call of his patients. Night and day the lives under his care must largely depend on the efficiency of his car. The Rover 10 h.p. Coupé is well equipped to undertake this heavy responsibility. The extraordinary reliability of its lively 10 h.p. engine, unfailing starting, easy access, and correctly designed suspension enable the driver to cover a considerable daily mileage calmly, confidently, and with a minimum of fatigue and nerve-strain. May we suggest that you give the Rover 10 h.p. Coupé a trial run?

Backache During Pregnancy Can be Relieved

by an *Individually Designed*

SPENCER MATERNITY SUPPORT

Spencer Maternity Belt. The abdominal supporting section is a separate section which is adjustable from the outside at several different points. The back of the Spencer Belt is broad and sufficiently high to provide adequate back support.

Many doctors have found that backache during pregnancy, ranging from discomfort to disability, is lessened and, frequently completely relieved by the use of a Spencer Maternity Support designed especially for the patient.

If her backache is caused by lumbo-sacral strain, sacro-iliac relaxation, faulty posture or any other condition which creates abnormal tension in the muscles of the back, the combination of abdominal and back support which a Spencer provides will relieve her. Likewise, nausea and vomiting, when not strictly pathological, are often relieved by wearing a Spencer.

Spencer Supports are designed to place the "pull" of support on the pelvic girdle—not on the spine at, or above, the lumbar region.

Apart from what therapeutic value a doctor may place on a light-weight, gentle support worn during pregnancy, a Spencer Maternity Corset accomplishes this. Its restful support and good style lines create a favourable mental reaction on the part of the patient, minimising sensitiveness to appearance.

As each Spencer Support is *individually designed* to meet the exact figure needs of each wearer, it fits so perfectly that it remains in place continuously and is comfortable.

BEWARE OF SUBSTITUTION.—Spencer Corsets Ltd. regret the necessity of warning the medical profession that in several instances where doctors have specifically prescribed a Spencer Support, a corset of another make has been substituted, and, because its makers do not understand the Spencer principles of individual designing, has been unsatisfactory. Every genuine Spencer Support bears the SPENCER Label.

Trained Spencer Corsettières are resident throughout the Kingdom. Name of nearest gladly supplied on request.

A scientifically trained Spencer Corsettière will call at your surgery, or at your patient's home to take measurements under your supervision.

DESOUTTER

CASE RECORDS

The value of artificial limbs for children

THE child who attends school on crutches or a Pylon is a cripple, and as such he is necessarily separated from his fellows and develops a crippled mental attitude. His physical growth is seriously interfered with, particularly in cases where only one crutch is used. Here the full weight of the body is borne on one leg at every step, and the Pelvis is tilted downwards on the unsupported side. Scoliosis inevitably results. In addition, the shoulders are hunched, the chest contracted, and the free use of the arms impeded. At the same time the muscles of the stump atrophy, and there is abduction and flexion with loss of mobility.

The use of a Pylon does not give much better results. The lack of a correctly articulated foot means loss of support, and the difficulty of balancing on a Peg-end results in the body being thrown sideways at every step. The absence of a knee joint forces the patient to swing the Pylon from the hip in a circular movement, and once this habit is formed it is impossible to teach a patient to walk correctly on a fully articulated limb.

Of the number of children who have passed through our hands some were so young when fitted that they actually took their first steps on artificial limbs, and were thus spared the misery and loneliness of a cripple. A child learns to use a limb so quickly and well that in a very short time he is no longer regarded as a cripple but begins to live the life of a normal child. He is able to join freely in the work and play of other children, both at home and at school, even participating in school games; in fact, it would be difficult to exaggerate the improvement in health and happiness of a child after the fitting of a limb.

It is almost inconceivable that after seeing both sides of the picture there can be any hesitation in providing artificial limbs for amputated children.

Case No. 7641. 1929

Amputation: double Symes. Cause: Deformed feet with absence of fibulas (congenital).

The limbs were amputated when the child was six years old, and both stumps were fully end-bearing. As is common in these cases, there was excessive lateral movement of the knee joints, particularly in the left leg, which showed marked Genu Valgum when the patient was bearing his own weight. (See Fig. No. 1)

After careful consideration it was decided to construct a pair of light metal limbs with extensible shins to allow for growth, and the stumps being fully end-bearing the sockets were fitted loosely, leaving

room for expansion. At the same time the Genu Valgum deformity of the left leg was corrected. (See Fig. 2)

The child made very rapid progress and was soon able to walk quite naturally, run and jump, ride a two-wheeled bicycle, and take part in most of the school games. The improvement in his health, mental and physical, has been most striking. A second pair of limbs was made 2½ years later, and Fig. Nos. 3 and 4 show the child at the age of 11, when a third pair of limbs was made. Comparison with Fig. No. 1 will show the increase in the size of the stumps and the muscular development of the thighs. There is practically no Scoliosis or Lordosis.

'PANOPEPTON'

'PANOPEPTON' is the food par excellence for invalids; in all acute diseases, fevers, etc., in convalescence, for the large class of persons who, from feebleness or deranged digestion, or antipathy to ordinary foods, require a fluid, agreeable, and quickly assimilable food.

Supplied in 12-oz. bottles.

For an adult the usual portion should be a dessertspoonful to a tablespoonful several times a day and at bedtime.

PEPTOGENIC MILK POWDER

For preparing HUMANISED MILK.

Humanised Milk is easily prepared with Peptogenic Milk Powder, is very palatable, being thin and sweetish like human milk. It very closely approximates to Mother's Milk, both qualitatively and quantitatively, and calls for the same digestive action on the part of the infant as does breast milk.

Supplied in two sizes.

Originated and Manufactured by—

FAIRCHILD BROS. & FOSTER (Inc. N.Y.), NEW YORK, and 65, Holborn Viaduct, London, E.C.1

HEWLETT'S ANTISEPTIC CREAM

AN EMOLLIENT HEALING CREAM

FOR

BLEPHARITIS, ACNE, ECZEMA,

and all abrasions and irritations of the skin.

MEDICAL OPINIONS.

"I consider that Messrs. Hewlett's 'Antiseptic Cream' is the best ointment that can be kept for general purposes. Its soothing and healing properties are most marked, and I have never seen its equal."

"E. N. —, L.R.C.P.Ed., M.R.C.S.Eng."

"I think this a most elegant preparation and certainly is excessively useful in skin abrasions."

"T. C. E. —, M.R.C.S., L.R.C.P."

"I have found great improvement from the use of your Antiseptic Cream in a case of Eczema of the Scalp which had been chronic for 18 months."

"D. K. —, L.F.P.S.Glasg., and L.M."

"Antiseptic Cream is a compound of zinc oleate with boric acid, lanoline, etc., which should serve many useful purposes."

—Bristol Medico-Chirurgical Journal.

In enamelled collapsible tubes, or 1oz. pots labelled only, "The Ointment. To be used as directed."

In bulk, 5oz., 10oz., 22oz., 40oz., 4½lb. and 7½lb. pots.

Introduced and prepared only by

C. J. HEWLETT & SON, LTD.,

35/42, Charlotte Street, and 83/85, Curtain Road, LONDON, E.C.2.

A NON-TOXIC SEDATIVE

ELIXIR BROMO-VALERIAN CO. (WYLEYS)

In this product the well-known features of Strontium Bromide and Valerian are enhanced by the addition of Adonis Vernalis, a vascular stimulant; and Viscum Album, which has been shown to be of service in the treatment of epilepsy, hysteria and chorea.

Its employment is indicated in conditions of anxiety and general irritability, insomnia and the treatment of functional nervous affections.

Price: 2/9 per 8oz. bottle; 5/- per 16oz. bottle.

Sample, with literature, on request.

OVALTINE

FOR THE OLD AND FEEBLE

DURING old age, when the digestive powers and vitality are on the wane, the problem of satisfactory feeding often becomes acute. A solution to this difficulty is found in "Ovaltine." Its delightful flavour appeals to the jaded palate, its digestive action aids the enfeebled assimilation, while its high nutritive value stimulates the flagging metabolism. It is a boon to the aged.

In "Ovaltine" the nutritive constituents of fresh milk, eggs and malt are transformed into crisp granules which dissolve readily in milk to form a delicious beverage. A cup of "Ovaltine" in the morning ensures energy for the day and a cup on retiring generally relieves the sleeplessness so common a symptom of old age, and gives digestive rest.

"Ovaltine" enriches the diet in certain important factors, notably calcium and vitamins A and B₂ which recent investigations have shown to promote longevity.

A liberal supply for clinical trial sent free on request.

NICOTINIC ACID B.D.H.

The recent differentiation of 'Vitamin B₂' into three factors (lactoflavine, 'pellagra-preventing' factor and B₂, the rat-dermatitis factor), followed by the investigation on the administration of nicotinic acid to pellagrins (*Journ. Amer. Chem. Soc.*, 1937, 59, 1767 and *Nature*, 1937, December 18, p.1070), established the specificity of nicotinic acid in pellagra. Confirmation of this discovery is afforded by more recent

reports (*Journ. Amer. Med. Assoc.*, December 18, 1937, p.2054 and *Lancet*, January 29, 1938, p.252) and it has been shown that nicotinic acid is a precursor of the 'pellagra-preventing' factor which is elaborated after the ingestion of this substance.

Nicotinic Acid B.D.H., for the treatment of pellagrous symptoms, is available in tablets each containing 30 mg. of the pure substance.

SUPERSAN

a safe, non-poisonous, and non-irritant antiseptic for all purposes

SUPERSAN is a new antiseptic having six times the potency of pure carbolic acid as tested by the Rideal Walker method. SUPERSAN retains its activity when intimately mixed with blood and serum, thus permitting adequate disinfection of wounds without injury to the tissues, and acting as an efficient antiseptic when it is most needed. SUPERSAN is especially suitable for sterilising the skin and for use in midwifery and surgery.

The "Malnutrition" controversy

"Ordinary mixed diet" unreliable as a source of Vitamin B₁

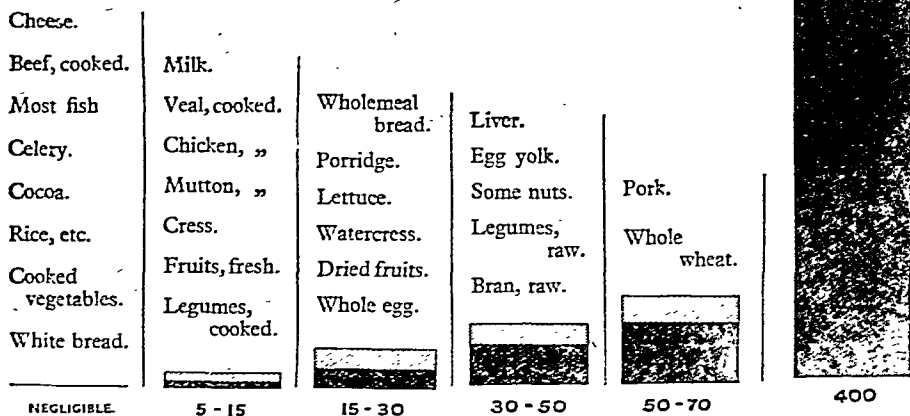

An editorial statement in the B.M.J., 16th Oct, 1937, page 753, that "Vitamin B₁ deficiency [is] an outstanding fault in the diet of many millions of people" gives added weight to the result of a large scale investigation in which 90.1% out of 2,000 patients showed improvement in health when their diets were supplemented with Bemax.

In Constipation 88.8% ; in Anorexia 80.0% ; in Malnutrition 78.4% ; in Colitis 79.5% ; in Indigestion 82.5% ; in Intestinal Toxemia 80.6% ; in Asthenia 87.3% showed improvement. *Of supposedly normal subjects, mostly physicians themselves or members of their families, 86.4% showed definite benefit in health from the use of Bemax.*

It is impossible to escape the conclusion that chronic Vitamin B₁ deficiency is a frequent but often unrecognised cause of these conditions ; even in supposedly normal health it may be present, but not suspected until the benefit from a higher Vitamin B₁ intake is observed.

VITAMIN B₁ IN FOODS

Measles Control with

IMMUNE GLOBULIN (HUMAN)

Lederle

BECAUSE of the frequency of complications, the mortality rate of measles is high—higher than that for whooping cough, diphtheria and scarlet fever.

Complications can be avoided by the use of IMMUNE GLOBULIN (HUMAN) *Lederle*, particularly those of broncho-pneumonia—responsible for about 50% of deaths in the infant age group (6 months to 3 years).

As a modification dose, one injection of 2 cc. is administered to patients in the infant age group from 6 to 8 days after exposure (for children in the same family this is 2 to 4 days after the appearance of rash in the exposing child). This dosage confers an active and lasting immunity in the majority of cases. For passive immunity of several weeks, a first dose of 2 cc. of IMMUNE GLOBULIN (HUMAN) *Lederle* is administered as soon as contact has been recognized; a second dose of 2 cc. four days later.

THE COMPARATIVE VALUE OF ADULT SERUM, CONVALESCENT SERUM, AND IMMUNE GLOBULIN PATIENTS TREATED FOR PROTECTION OR MODIFICATION

ALL TYPES OF EXPOSURE

Procedure	Cases	Per Cent. Protected	Per Cent. Modified	Per Cent. Failed

TINCTURE

POWERFUL

In a comparative study Metaphen has been shown to be from 8.6 to 1,500 times more germicidal against *staphylococcus aureus* than five other commonly employed antiseptics, including mercuric chloride and tincture of iodine. Against other common organisms, Metaphen also demonstrated its marked superiority over all of the drugs tested. • Furthermore, Metaphen was found to be 10% more effective for surface skin and 37% more effective for deep skin disinfection than tincture of iodine. (*Annals of Surg.*, 93:587-597.) • In addition to its great bactericidal power, Metaphen has other important advantages. It is non-toxic and non-irritating; does not coagulate serum or tissue albumins; and its solutions are stable when exposed to air. • Metaphen is supplied in a variety of forms, among which are: **TINCTURE METAPHEN 1:300**, a tinted, alcohol-acetone-aqueous solution prepared especially for use as a pre-operative skin disinfectant; as well as for all other conditions for which an extremely powerful but safe antiseptic tincture is indicated. • **METAPHEN SOLUTION 1:500** is recommended for general use wherever a powerful germicidal action is desirable. Requests for professional literature will be welcomed.

the scientific contraceptive

MIL-SAN is submitted to members of the medical profession who are interested in the control of conception, in the firm belief that it is the most effective contraceptive produced in the light of present-day medical knowledge. Further that it is non-injurious, unobjectionable and hygienic in use and simple to apply.

A booklet and medical specimen pack are sent, on request, to members of the profession. Information regarding the basis of the formula, the ingredients, the tests made and the action and behaviour of the product are set out fully,

while the specimens sent demonstrate clearly the simplicity and advantages of the application method. There are no contra-indications to the use of MIL-SAN with a dependable condom or a properly fitted occlusive pessary. It is only by such combined use that the consequences of misuse of one or other of the methods can be minimized and the maximum practicable security obtained. MIL-SAN is on the N.B.C.A. Approved List for use with a cap or condom.

Please write name and address plainly or send card or note heading when requesting particulars and specimen tubes.

Medical Men supervised the design of the Linia Belt

The Belt for correction of Ptosis, Obesity, Faulty Posture and for post-operation wear.

It was on the advice of medical men that the Linia Belt was evolved; frequent tests by doctors were carried out before it was made available for sale. That is why it is the recognised belt for men's wear.

Made to measure for every case, the Linia Belt is prescribed for obesity, for various ptotic conditions, for post-operation wear, for wear by the older man during golf and so on. The front is of thin, non-elastic tricot, the back of strong elastic. It is fully adjustable by slide buckles.

YOU CAN ORDER BY POST.

Perfect fitting guaranteed or money refunded in full. We make a reduction of 2/- in the £ on purchases for personal use to members of the Medical Profession. May we send you a fully explanatory booklet?

PRICES:

Linia Belt, including a Linia Jock Strap: Popular Model, 3/- gns. (Black 4 gns.). De Luxe Model in pure silk, extra light quality, 6 gns. (Black, 7 gns.). Standard Model, 2 gns. C.O.D. 1/- extra.

★We shall be pleased to forward a specimen Linia Belt for your examination on approval.

The Linia Belt is on Sale Only at
J. Roussel, Ltd. (Dept. ME),
177, Regent Street, London, W.1
Telephone: Regent 7570.

And at 43, Cheapside, E.C.2, and five other London branches.

I enclose cheque (less 10%) or please send on approval.

★ Please send me a free copy of "The Linia Method" booklet, fully describing the Linia Belt.

My name and full address are attached. ML10.

Nujol Laboratories confidently commend this new and efficient medicament . . .

Stemcol for cough

The Stemcol formula contains nothing revolutionary. It embodies expectorants, demulcents and antiseptics long approved by the medical profession. What *is* new, however, in Stemcol is the combination of these essential medicaments with Nujol . . . the standard viscosity liquid paraffin . . . in a pleasantly flavoured intimate emulsion. Stemcol contains no narcotics or sedatives and can, therefore, be prescribed for quite young children and the aged tracheitic or bronchitic patient with full confidence in its efficiency and safety. Stemcol has been the subject of a large number of favourable reports in:

	VITAMIN A.	GOOD
	VITAMIN B.	V. GOOD
	VITAMIN C.	V. GOOD
	VITAMIN G.	FAIR
	CALORIES PER OZ.	17.0

A typical example of the high nutritive values retained in Heinz Strained Foods. (Figures show percentages on the wet basis)

Vegetable and fruit purées, rich in mineral salts, vitamins and other soluble nutriment, constitute the perfect diet for infants and cases of nutritional anaemia.

But despite the wide approval shown by physicians, and a growing appreciation of this dietary by mothers, progress has hitherto been slow, owing to the practical difficulties encountered in home preparation.

The use of vegetables not truly fresh, mechanical losses through oxidation when boiling, and inefficient sieving out of the harsh fibres, inevitably impair the quality of the home-produced preparation.

Now, with the marketing of a range of strained foods by H. J. Heinz Co. Ltd., vegetable and fruit purées containing all necessary dietetic values are available in convenient bulk and form.

Heinz Strained Foods are prepared with all the advantages of the best factory method. The vegetables are specially grown in those areas where soil and climate combine to produce the best; they are harvested when they are just right, and cooked within a few hours of being garnered.

First, the ingredients are scrupulously cleaned. Cooking by light steam pressure in vacuum containers follows, leaving the contents perfectly disposed for comminution by extrusion, and at the same time ensuring retention of the essential juices and mineral constituents. Fine sieving having removed all fibres of a harsh or irritant nature, the purée is then adjusted to an acceptable consistency and sealed in vacuo, the sealed containers being immediately subjected to sterilization under constant conditions of time and temperature.

The purées thus offered are uniform, convenient and of the highest possible nutritive content.

NOTE : *Glass containers are not used owing to the deleterious effect of light on the value and palatability of the purées*

Valentine's Meat-Juice

IN the Treatment of Weak Babies, in the Gastric and Enteric Troubles of Infants and in the Wasting and Febrile Diseases of Children, the Ease of Assimilation and Power of Valentine's Meat-Juice to Sustain and Strengthen has been Demonstrated in

Hospitals for Children.

The quickness and power with which Valentine's Meat-Juice acts, the manner in which it adapts itself to and quiets the irritable stomach, its agreeable taste, ease of administration and entire assimilation recommend it to physician and patient.

Physicians are invited to send for Clinical Reports.

For Sale by European and American Chemists and Druggists.

VALENTINE'S MEAT-JUICE COMPANY
RICHMOND, VIRGINIA, U.S.A.

Gastritis

Sanatogen is a *chemical combination* of ninety-five per cent. concentrated milk casein and five per cent. sodium glycerophosphate, which can be easily digested and absorbed even in cases of enteritis. Moreover, it stimulates a better utilisation of whatever ordinary food can be taken.

"I had a female patient age 43 who was always rather below weight and nervy. She suffered severely from acute Gastritis following mild food poisoning and progressed slowly. She was put on carefully chosen soft foods, rest in bed, sedatives and Sanatogen, commencing with one teaspoonful three times daily. The last dose was taken half an hour before settling down for the night. She certainly improved. The stomach could receive and retain, with comfort, more food, and the nervous symptoms showed marked improvement, especially regarding sleep and general interest in life."—L.R.C.P. & S.

COD LIVER OIL

is the only Liver Oil with a pedigree
of proved achievement behind it

.. now available in a
PALATABLE, HIGH-POTENCY FORM

The study of Vitamins A and D originated through research into the value of Cod Liver Oil as a builder of constitution—sufficient proof of its long standing as a nutritive food. Cod Liver Oil contains nature's Vitamins A and D in their right proportion. That is why it is specifically recommended by the Ministry of Health and the League of Nations Nutrition Committee. Only its general character has been against it in the past but now we have got over this difficulty. We have produced in "SevenSeaS," for the first time, a Cod Liver Oil of fresh pleasant flavour in high potency form.

"SevenSeaS" is obtainable in three forms: (1) High Potency Oil—four times B.P. standard; (2) High Potency Capsules containing 5 mm. dose of High Potency Oil; (3) Standard B.P. Oil. We would like all practitioners to prove "SevenSeaS" High Potency Cod Liver Oil to their own satisfaction. Please send to the address below for a free sample.

PRICES:

HIGH POTENCY OIL (you only need 5 drops)	• 1/3 bottle
HIGH POTENCY CAPSULES (25 Capsules)	• 1/6 "
" " " (50 ")	• 2/9 "
" " " (100 ")	• 5/- "
"B.P." STANDARD OIL	• 10d. & 1/3 "

From all chemists, including Boots, Timothy White & Taylors, etc., etc.

SUGGESTIONS RELATING TO THE STUDY OF SOMATIC PAIN*

BY

SIR THOMAS LEWIS, M.D., F.R.C.P., F.R.S.

(From the Department of Clinical Research, University College Hospital Medical School)

It is my purpose in this paper briefly to outline certain aspects of pain from the standpoint of investigation, and to suggest the use, or the more extended use, of the experimental method of studying pain. I shall deal particularly with descriptions and identifications of different varieties of pain, and almost exclusively with that derived from somatic structures.

Preliminary Consideration of Some Gaps in our Knowledge

It has long been manifest that a history of pain—as it is related, with the full circumstances in which pain is felt, by an observant subject—may be itself diagnostic of a given disease or of disturbance of given tissue. I believe time will show this method to possess a longer reach than we have suspected; but before its full worth can be attained descriptions of pain must be made more accurate.

It must be obvious to anyone who has given thought to the matter that most descriptions of pains—as these are supplied to us by those who suffer from them in words purely of their own choice—fail to convey sufficiently precise ideas of the sensations experienced and therefore do not adequately identify them. One reason for inaccuracy and inadequacy of description is the difficulty of calling up exact memories of what has been felt some time previously. It is certain that the closer the description is to the event the more accurate it becomes, and that the description is most accurate when given at the time pain occurs and deliberately revised when it recurs. Another reason is the difficulty of finding right words of description and apposite illustrations; to do this requires a degree of observational and didactic skill, and of experience, which very few possess.

To be complete a description of pain experienced must at least comprise a statement of severity, of kind or quality, of relation to time, of locality, and of the circumstances in which it is felt. I shall attempt to deal with these separate aspects of pain neither exhaustively nor even equally, but only so far as will serve to make clear such relevant observations and ideas as I have to offer, and to bring different features into perspective.

SEVERITY

The general level of a pain's severity is recognized to be of clinical value; few pains, however, can be properly described as agonizing, and most of these are known to be derived from the viscera. It is widely believed that the intensity of pain in patients can be evaluated by those possessing intimate knowledge and sound judgment of human types and motives: but it is clear that in very many

individual instances intensity cannot be gauged accurately either from the patient's account of it or from associated reactions. I am inclined to doubt if much, or even anything, would be gained by attempting to set up standards of pain severity with which spontaneous pain could be compared: and so I shall not speak further of the measurement of pain's intensity.

DURATION: TIME-INTENSITY CURVE

It is obvious that the diagnostic importance of a pain's duration rests on the time relation of the pain period and of its causal mechanism. This is well understood.

A feature of pain to which much too little attention has been given is what I may call the curve of pain intensity. It is of importance both because it is capable usually of accurate description and because it has a number of very significant associations. The curve portrays the manner in which pain starts, the rapidity of its culmination, the duration and smoothness at its height, and the manner of its decline. Pain may come and go in a flash, as when the skin of the face is pricked: it may rise to a plateau and last with little fluctuation for a long time before diminishing and vanishing, as when the skin has been burnt or in the attack of angina pectoris; it may be felt in rhythmic pulses, as in inflammation of dental pulp or in pulsating headache—an instance of more obscure derivation but one to which Pickering (1933) has made important and interesting contributions: it may be experienced as longer and less rhythmic phases, as in intestinal colic. All such variations must possess precise significances, related to the organ in which pain arises and to the manner of its origin. This is still largely an unexplored field, but a promising one for graphic record and other investigation.

LOCALIZATION

We know that the seat of origin of pain may be located by patients sometimes with precision, and that the general region from which it comes may be indicated clearly. The value of pain-localization as pointing to the seat of mischief is universally recognized; but accuracy in describing locality in which pain is felt begins to decline from the instant pain ceases. Localization should therefore be effected as far as possible while pain is felt: and it may be advantageous in the case of patients to test how closely the subject can localize appropriate pain when it is induced from a known region experimentally. There is another comment, and one which I think more important, that I would like to make in speaking of the localization of somatic pain. It is too generally assumed that somatic pain locates the seat of mischief. It locates the seat of mischief with great precision when this is the

Prescribe FAREX for a 'Tonic' Breakfast...

As a breakfast food Farex has special advantages. While being "light," ready to serve, and readily taken even by those who claim they cannot "stomach" breakfast, it supplies both energy components and protective materials in appreciable amounts. Besides its naturally high complement of vitamin B₁ and B₂, Farex contains measured amounts of vitamins A and D, iron, calcium and other minerals. Improvement in vigour and well-being is marked when Farex is prescribed as a "tonic" breakfast in debility.

FAREX

Reinforced CEREAL FOOD

Substantial in Health, Sustaining in Sickness. In Powder Cartons 1½- and 1½ (double size). (Not available in Eire).

To Expedite Convalescence

In febrile illnesses and "run-down" conditions the final chapter of the case history can be shortened by Syrup Minalex. This modern reconstructive tonic provides iron to regenerate the blood, calcium and phosphorus to restore neuromuscular tone, vitamins A and D to bring back resistance and normal function. Can be prescribed with perfect safety for children or adults. Children like it.

Syrup

MINADEX

The Restorative Tonic

Prices (except in Eire) 6 oz. bottles, 2/6; 12 oz., 4/6; 80 oz. Winchester, 22/6; Subject to usual professional discount.

LABORATORY NATIVELLE LTD.,

NORTH CIRCULAR ROAD, CRICKLEWOOD, LONDON, N.W.2

the skin. Pain quite indistinguishable from this arises out of injuries resulting from continued friction, abrasions, crushes, freezing, ultra-violet burns, and irritant substances. And here it is important to note that it is identical in quality with, though it is usually less in intensity than, the pain previously discussed—namely, that which occurs during the actual period of stimulation. A series of minute scratches, closely set, gives rise after an interval of time to a very definite continuous pain: it has precisely the same qualities as the pain which follows a burn or which occurs after chloroform has been held on the skin. Comparison should be made of two forms of stimulation, applied symmetrically and simultaneously to two arms; the result is then convincing in the sense indicated. This and similar observations establish the fact that pain of only one *quality* can be provoked from skin. When we speak of "smarting," "burning," or "stinging" we are using terms that lack precise distinction. Some think it convenient to say that smarting is less intense than burning, others describe smarting and stinging as pain which begins with relative suddenness or does not continue long at full intensity. In the last instance the pain produced by the stings of insects or of plants clearly guides the definition. There are many variations in the curve of pain intensity, but there is no variation in the quality of pain originating in skin. The quality is the same however the pain is produced, whether from stimulation of nerve endings or of nerve fibres. While anaesthetizing by hypodermic injection a small cutaneous nerve, previously and accurately located, it is not very unusual for the needle point to touch the nerve; a burning pain is then felt in the area of the nerve's distribution which in quality is indistinguishable from that produced by injury of the skin itself.

Muscle Pain

The second example of pain I shall consider is that derived from muscle. Experiments in which pain is deliberately provoked from skin are easy to devise and to control. To test deeper-lying structures it has been necessary to use different methods. If the circulation to a limb is stopped and a group of muscles is exercised voluntarily, or if a single muscle is forced to contract by direct electrical stimulation, after a time pain is produced in the limb. This pain, as Pickering, Rothschild, and I (1931) proved, is derived from the muscle, and we put forward abundant evidence to show that it is due to a chemical or physico-chemical pain factor arising in muscular metabolism. This pain is disagreeable, it is rather diffuse and difficult to locate, it is continuous, and it is thought by most to waver a little in its intensity; its quality is indescribable, but the pain is distinctive. It is impossible to confuse pain from skin and pain from muscle.

When convinced that pain derived from skin has a constant quality or tone I turned to muscle and tested this to see if pain originating from it possessed similar constancy. I first used isotonic acid solution (a phosphoric acid and disodium hydrogen phosphate mixture of pH 5.0 to 6.5), injecting 0.3 c.cm. through a fine needle into a dorsal muscle of the forearm and comparing the resulting pain with that produced simultaneously in the symmetrical muscle by working this under ischaemic conditions. The two pains were indistinguishable. I subsequently used hypertonic solutions (4 to 5 per cent. sodium chloride), injecting a similar quantity of this, or alternatively of 0.5 per cent. potassium chloride with enough sodium chloride to render the solution isotonic; these injections also gave identical pain. Pain can be pro-

voked mechanically by squeezing muscle firmly between finger and thumb: it can easily be elicited by light pressure over muscle that has been much used the day before. Similar pressure exerted upon the more superficial tissues is without effect: pain so induced is again found to be indistinguishable from that provoked by the same muscle by working it under ischaemic conditions. As an experimental method of producing muscle pain the injection of a minute quantity of a salt solution is the most satisfactory; it is very simple, harmless, and the stimulus is confined to a small mass of muscle. We have seen in the case of skin that pain, though it is of one kind, may be provoked for an instant or for indefinitely long periods. I have not succeeded in provoking very brief pain from muscle: once it appears in the field of consciousness it seems always to last at least a few seconds.

We have in this instance of muscle a second example of tissue from which pain of only one kind can be provoked: muscle pain, when it has been experienced often enough, can usually be recognized as such; it is pain most uniformly described as "aching" pain.

In these observations I have noted that muscle pain is referred to a distance. Thus pain arising from the lower part of the triceps is often referred down the inner side of the forearm to the little finger: from the trapezius it is usually referred to the occiput. I have been fortunate in interesting Dr. Kellgren in this matter. In a long series of very careful researches carried out in my laboratory he has formulated some very striking principles underlying the reference of pain from muscle—principles which appear to have an important practical bearing.

Web, Tendon, and Periosteal Pain

Thunberg (1902) distinguished a form of pain which he called "dull" pain ("dumpf Schmerz") and which was probably derived from subcutaneous tissues: as he points out, pain of this quality is readily produced by tightly squeezing the short web of skin between two adjacent fingers. The quality of two pains is a little less easy to compare if they are derived from unsymmetrical structures. Despite this fact I believe that pain derived from squeezing the web and from squeezing tendons, such as the tendo Achillis or that of the biceps flexor cruris, can be recognized to be of one quality. Here it may be said that pain from a tendon has exactly the same quality whether induced by pressure or by the injection into it of a small quantity of hypertonic salt solution or of buffered acid solution. In the same class as pain from tendon I would place also pain derived from the periosteum. In eliciting the latter I anaesthetize a little piece of skin over the tibia and carry a needle through this until it impinges on the bone. Each time the needle is jabbed against the tibia a disagreeable diffuse pain is produced which lasts at its height for an appreciable time. Similar pain is provoked but is longer-lasting if a small amount of hypertonic saline is injected while the needle point is against the bone. This pain, presumably arising from periosteum, is similar to if not indistinguishable from web and tendon pain. If a joint is strained in rough walking, pain is felt subsequently at each movement of the joint; it is an intermittent and rather short-lasting pain, but its quality is the same as that here described. When I have provoked pain from the periosteum it has been located with much accuracy. Head and Rivers (1908) found deep pain from pressure on the dorsum of the hand, when the skin had lost all sensation, to be accurately located. But reference sometimes occurs. Thus I have noticed that pain from saline injections confined to the subcutaneous tissue on the dorsum of the

skin or an exposed mucous membrane; but there is much less evidence that it does so when deeper somatic structures, such as subcutaneous tissue, muscle, etc., are concerned. There are already a few well-recognized examples—for instance, the reference of pain from diaphragm to tip of shoulder or from hip-joint to knee—which illustrate how faulty the location of disease by pain may be. But my point is that such examples have come to be regarded as exceptional and that too little experimental work has been done on pain derived from these deeper structures.

QUALITY

One of the least-studied features of pain, and one to which I shall give more space, is its kind or quality. A direct description is no more possible than it is in the case of sense of colour: here we use the device of exemplification or association, as when we talk of "blood-red" or "orange"; and the frequent descriptions and comparisons of everyday life enable us to attain a high degree of accuracy in conveying by this method the idea of particular colours or tints. In describing the kind or quality of pain we are likewise restricted to exemplification, but in this connexion experience is infrequent and limited and the art of description is unpractised and unchecked. It is my view that experience may be supplied and practice obtained in the recognition of pains of different qualities and the naming of them. Common parlance has acquired a few striking terms, as when we speak of pain as "burning" or as "pricking," quite distinctly meaning to associate such pains with those provoked by burns or pricks. Here are two instances achieving unusual accuracy. But many terms in use and of like origin, such as tearing, boring, cutting, stabbing, and crushing, owing to the comparative infrequency of corresponding physical damages, convey as between two persons no exact ideas. The common device of describing pain in terms linking it with various forms of injury has little scientific and, apart from a very few examples, little practical value. This method of description has been almost sterile, because, as already indicated, experience of the relevant kinds of injury is uncommon and thus the terms cannot recall the appropriate sensations, and for other reasons. Thus it is obviously not clear that a constant type of pain is produced by an act of crushing or of tearing, and it is known that one kind of pain can follow both a crush and a burn. Another defect of current terminology is that it is often uncertain whether a term is used to convey an idea of the quality of pain or to illustrate the sequence of events as portrayed in the curve of pain intensity. The erroneous impressions which arise and are conveyed by the use of such terminology are indeed very numerous and serious, as will become clearer later in my attempt to analyse and define various types of pain. In illustrating and in leading up to certain suggestions and generalizations, I propose to consider pain, and especially the quality of pain, provoked from three somatic structures—namely, skin, muscle, and tendon (or web, etc.).

Skin Pain

When pain is derived from skin its localization is very accurate; it varies in intensity and in its duration, it may change from moment to moment, but it does not vary in quality or tone. Though this idea has been expressed by previous workers (Becher, 1915; Alrutz, 1909) and is summed up in the term "bright" pain ("hell Schmerz") of German writers, it is not apparent that it has been at all generally acknowledged. It is of so much importance if true that it deserves to be brought to the point

of demonstration. Pain can be provoked by injuring the skin in a large number of different ways, as by pricking with a sharp point, by pinching tiny folds of skin, by pulling on hairs, by burning, by the passage of electrical current, and by the application of irritant poisons. The quality of pain evoked in these several ways from skin can in fact be demonstrated to be unvarying, in that when the tests are properly applied the subject is unable to decide the manner in which pain is produced. A fine wire is bent at an acute angle and heated electrically; the angle is brought into quite transient contact with the skin, or, alternatively, the skin is pricked by a needle. A blindfolded subject cannot detect which of these two forms of stimulation is employed (Lewis and Hess, 1933). Similarly, a quick tug upon a single hair or the make-and-break shock of a galvanic current may be used. All these will be described as pricking pain without distinction. Naturally it is necessary that the subject should not be allowed to receive associated sensory (but unpainful) stimuli that are peculiar to the form of stimulation. Thus if the contact of the hot wire is maintained unduly its warmth may be felt in addition to pain, and the form of stimulation will then be detected at once. When a hair is to be pulled it should first be isolated so that it may be grasped and pulled without warning, which simple contact with this or neighbouring hairs will give; and counter-pressure should be exerted around its base so that when the hair is pulled the skin is not lifted. Similar counter-pressure should be exerted when needle-prick, hot-wire contact, or galvanic shock is compared with this form of stimulation. The greater the precaution taken to eliminate supplementary sensory stimuli, or to reduce these to uniformity in comparing different forms of painful stimuli, the more successful will be the tests. The subject tested is soon aware that it is impossible to distinguish the different pain stimuli and that, where the form of stimulus is recognized, the recognition depends upon a non-painful accompanying sensation. The stimuli just discussed are all brief ones, and their effects are all called "pricking."

A prolonged stimulus gives rise to pain described as "burning"; and this is always so, whether the pain arises from heat or not. The bent wire is carried just through a small cork and thus applied to the skin, and enough current is now led through the wire to heat it; a needle point is sunk in a similar cork, and from it a galvanic current of appropriate strength is turned into the skin; an isolated hair is pulled and held tense through a small slit in a cork held around it and in contact with the skin; or a tiny fold of skin is caught up in sharp-edged forceps and pinched in similar circumstances: the subject cannot differentiate. All these forms of stimulus give rise to pain that is described without distinction as "burning" pain. It is recognized as such, not because of its peculiar quality, but because it is a cutaneous pain that continues; it is called "burning" from association. The hot stimulus applied briefly causes what is termed "pricking" pain; prolong the same stimulus and it is called "burning." The initial pull on a hair causes a "pricking" pain, but if the hair is held tense the quality of the pain, though quite unchanged, is now called "burning." The difference between "pricking" and "burning" pain is not one of quality or tone, it is purely one of duration.

So far pain arising from and ending with brief or short stimulation of the skin has been discussed; but it may also continue as an after-effect of injury. The most widely recognized pain of this kind is that continuing for some time after contact with an object hot enough visibly to injure.

She was a stout woman in good general health. All movements of the right shoulder were painful, and abduction and internal rotation were limited. The elbow, wrist, and hand joints appeared normal and there was no wasting and no sensory changes in the skin. A radiograph showed no bony abnormality in the shoulder or neck. Tender spots were found in the deltoid and supraspinatus and at the back of the shoulder over the *latissimus dorsi* or *teres minor*. These spots were infiltrated with 18 c.cm. novocain. There was a momentary increase of pain in the arm, forearm, or thumb during the injection of the different spots. When all the spots were anaesthetized the pain in the arm was abolished and the patient could move her shoulder painlessly through a full range. One week later there had been no return of pain in the arm, though it still felt heavy and weak.

Case IV

A police constable, aged 45, who had knocked his right elbow six weeks earlier, and since then had suffered from aching pain in the forearm and over the back of the hand.

He was a healthy muscular man. His elbow and wrist movements were full and painless, but gripping with the right hand was painful and weak. Extension of the fingers against resistance was also very painful. A tender spot was found in the belly of the extensor digitorum communis, and the tip of the external epicondyle was tender. The tender muscle was infiltrated with 5 c.cm. novocain. This abolished the pain, and his right grip was now strong and painless. One week later there had been no return of pain and his right grip was strong; the epicondyle was still tender.

Case V

A potato porter, aged 62, had suffered from lumbago on and off for forty years, but had been in more or less constant pain for the last year. Ten days previously he had had a great increase of pain, and since then this had been continuous; he obtained no relief in any position, and all movements were painful. The pain was felt over the left sacro-iliac joint and the left buttock.

This patient was an old but muscular man. He had great difficulty in moving because of pain, and he held his back quite rigid. Straight knee leg-raising: right to 65 degrees, left to 40 degrees, both limited by pain in left buttock. A tender place was found in the left erector spinae opposite the first, second, and third lumbar spines. This place was infiltrated with 30 c.cm. novocain. The pain was abolished; he could then move about painlessly and had fair mobility in his back. Straight knee leg-raising to 75 degrees on both sides. One week later he had had little pain since the injection and was free from pain except after prolonged sitting. Straight knee leg-raising to 80 degrees on both sides.

Case VI

A van driver, aged 33, had suffered for a year from aching pain in the right calf of gradual onset. For the last six months this had been getting worse, and had spread to the thigh and hip; it was a continuous ache, aggravated by walking or sitting down.

The patient was a thin man who appeared in good general health. In standing his weight was on his left leg, with his pelvis lower on the right side and with a lumbar scoliosis. He had a full and painless range of movement in the right hip, knee, and ankle, but there

was some stiffness of the lumbo-sacral spine. Straight knee leg-raising to 80 degrees on left side and 40 degrees on right (limited by pain in leg). The right ankle-jerk was absent, but there were no sensory changes in the skin of the right leg.

Two tender spots were found—one in the right gluteus medius and the other in the right sacral erector spinae. Pressure on the sacral spot gave pain in the calf. The sacral tender spot was infiltrated with 40 c.cm. novocain. During the injection there was a momentary increase of pain in the calf. When this spot was anaesthetized the pain in the calf was abolished, but there was still some pain in the hip. Straight knee leg-raising to 75 degrees on right side, 80 degrees on left. The scoliosis was less obvious on standing. One week later he had been free from pain for two days, after which there had been some return of pain in the calf. The erector spinae was still tender, and the novocain infiltration was repeated. One month later he had had no pain in the calf since the second injection, but still had pain in the thigh and hip. He had no scoliosis on standing, but the right ankle-jerk was still absent.

Case VII

A baker of 36, who for seven months had suffered on and off from pain in both hips and legs. For the last week he had had a continuous aching pain in the left knee and in the outside of the left thigh and calf.

He was a muscular man who appeared in good general health and had a normal posture. He had limitation of abduction and rotation in both hips, but only the left was painful; there was full and painless movement in both knees and back. Straight knee leg-raising to 75 degrees on both sides. His knee- and ankle-jerks were present, and there were no sensory changes in the skin. Radiographs showed bilateral coxa vara, with very slight osteo-arthritis changes. Tender spots were found in the left gluteus medius and tensor fasciae femoris. These spots were infiltrated with 70 c.cm. novocain. During injection there was a momentary increase of pain in the knee. When the infiltration was complete the pain in the knee was abolished, but there was still slight pain in the hip. There was no change in the range of movement. One week later he had been free from pain for six days, though the night after the injection he had had much pain. The movements of both hips were still limited, though painless.

Case VIII

A clerk, aged 17, who had suffered from pain in his right foot for three weeks. This was not of sudden onset, and he had had no injury. The pain was felt under the metatarsal heads and in the outside of the foot and ankle. He had pain with each step and walked with a gross limp.

He appeared in good general health. His ankle and foot movements were full and only slightly painful. Radiographs showed no bony abnormality in the right foot. There was tenderness of the third interosseous space. The tender space was infiltrated with 3 c.cm. novocain. During the injection his pain was reproduced momentarily. Then it was abolished, and he could walk normally with complete comfort. Three weeks later he had been quite well except for two days following the injection, when he had had slight pain.

I am indebted to Dr. Bauwens of St. Thomas's Hospital, and to the casualty officers of University College Hospital, for allowing me to publish cases seen in their departments.

that novocain injection may be of therapeutic value in these cases, though the reason for its permanent effect is at present uncertain, and is under investigation.

The injection of local anaesthetics is of course a well-known therapeutic measure which has claimed occasional successes in these complaints, as indeed have most forms of local therapy. The uncertain results obtained with local therapy are not surprising when one considers that without an accurate knowledge of the distribution of muscular pains the therapy must often be applied to areas of referred pain and tenderness instead of to the source of the pain. It remains to be seen how much a further knowledge of muscular pain will help in the treatment of these very difficult cases.

(trapezius or rhomboids). The tender spots were infiltrated with 16 c.cm. novocain. This abolished the pain and he could move his head and neck painlessly through an almost normal range. One week later he was quite free from symptoms and had a full range of movement in the neck, though, he had had some pain for two days after the injection.

Case II

A housewife, aged 35, who for two weeks had suffered from an aching pain felt down the outside of the left arm from the shoulder-tip to the elbow. The pain was continuous and aggravated by use of the arm, and she also had sudden stabs of pain when moving the abducted arm.

Showing the distribution of pain (hatching) and tender spots (black) in eight cases in which the pain was abolished by anaesthetizing the tender spots with novocain.

Case I

A builder, aged 41, who had suffered for six months from pain in the left side of his neck. This came on gradually while he was doing overhead work to which he was unaccustomed. The pain was a continuous ache felt over the left side of the neck from the shoulder-tip to the occiput. The pain was aggravated by any use of the left arm; his neck felt stiff, and he had sudden exacerbations of pain on attempting to move his head. For the two weeks before he was seen the pain had been worse and had kept him awake at night.

He was a muscular man who appeared in fair general health. He held his head flexed to the right, and all neck movements were greatly limited by pain. He had a full range of passive movement in the left shoulder, but active movements were painful. Two tender spots were found—one in the erector spinae at the root of the neck, and the other by the vertebral border of the scapula

She was a stout woman who appeared in good general health. Her shoulder movements were full, except extension and internal rotation, which were limited by pain. A tender spot was found in the deltoid near its anterior border. This spot was infiltrated with 10 c.cm. novocain. During injection the pain in the arm was momentarily increased; then it was abolished, and at once internal rotation and extension of the shoulder became full and painless.

Case III

A housewife, aged 50, who for six months had suffered from pain in the right arm. This was of gradual onset and there was no history of trauma. Lately the right hand had felt weak and she had had some numbness and tingling of the fingers. The pain was a continuous ache felt from the shoulder-tip down the outside of the arm, the back of the forearm, and in the thumb.

acid values of 1.32 to 2 mg. per 100 c.cm. (Table I, column 2). It will be noted that in the twenty-one proved "unsaturated" patients (column 1) the dye was decolorized in 3 to 29 minutes (average 16.9), sixteen requiring 10 or more minutes. When entirely saturated these same patients showed complete decolorization of the dye in 0.5 to 6 minutes (average 2.3 minutes). By reference to the table it will be seen that the five unsaturated patients having decolorization times of 9, 9, 9, 4, and 3 minutes showed marked reduction to 1, 2, 1, 2, and 0.5 minutes respectively after saturation with ascorbic acid.

In the intermediate "partially saturated" subgroup (having blood ascorbic acid values of 0.72 to 1.3 mg. per 100 c.cm.) the times for decolorization slightly overlapped the other two subgroups, having a range of 3 to 13 (average 7.5 minutes)—two being longer than 10 minutes and five less than 7 minutes.

The second group (sixty-eight cases) has been examined from the dietetic point of view and correlated with the skin test; since full ascorbic acid determinations were not made these observations are not so useful as those obtained in the first group. Nevertheless the patients showed similar results (Table II). Thus:

(a) In eighteen patients taking full mixed diets including large amounts of fresh fruit and vegetables daily the decolorization times were 2 to 7 minutes (average 3.4 minutes), and compare well with the corresponding results in Group I (0.5 to 6 minutes).

(b) Thirty-seven patients had been having fair diets—that is, ordinary diets without extra fruit, and apparently not deficient in vitamin C. These had decolorization times of 3 to 16 minutes (average 8.8 minutes).

(c) Thirteen patients had been on very deficient diets without any fresh fruit, vegetables, or vitamin-C-containing foods. These included scorbutic patients, and patients with gastric or duodenal ulcers taking strict diets without added ascorbic acid. Twelve of these patients had decolorization times between 10 and 33 minutes, and one gave a low decolorization time of 4 minutes; these times correspond very well with those obtained in the unsaturated patients of Group I, where the range was 3 to 29 minutes, with two low times of 4 and 3 minutes respectively.

With such a short series of cases it is difficult to reach definite conclusions, but it will be seen that a prolonged decolorization time (certainly greater than ten minutes) apparently parallels a deficiency of vitamin C. This does not necessarily mean that the skin test is a direct measure of the ascorbic acid content of the tissues, since

other reducing substances, such as glutathione, will also cause a reduction of the dye. Nevertheless Rotter's skin test may furnish a useful rapid clinical test for vitamin C subnutrition, and is worth further study. The relation between the reduced ascorbic acid content of the blood and the skin decolorization time as determined by this method is shown in the diagram.

Diagram showing the correlation between the decolorization time and blood ascorbic acid.

Summary

A suggested intradermal test for vitamin C subnutrition using 2:6-dichlorophenolindophenol has been examined in a series of 103 patients.

Prolongation of the decolorization time appears to run parallel to the degree of vitamin C content of the tissues, although other reducing substances in the skin may be concerned in the decolorization phenomenon.

The method may be of value as a rapid clinical test for vitamin C deficiency. A decolorization time of less than five minutes indicates tissue saturation with vitamin C, while ten minutes or longer is in favour of a deficiency.

We wish to thank the honorary physicians of the Manchester Royal Infirmary for permission to use their cases and Roche Products Limited for the generous supplies of redoxon ascorbic acid. The work was carried out with the help of grants from the Medical Research Council and the Dickinson Research Scholarship Trust (B.P.).

INTRADERMAL TEST FOR VITAMIN C DEFICIENCY

BY

BENJAMIN PORTNOY, M.B., Ch.B.*Department of Clinical Investigation and Research, University and Royal Infirmary of Manchester*

AND

**JOHN F. WILKINSON, M.Sc., Ph.D., M.D.,
F.R.C.P., F.I.C.***Physician in Charge and Director of the Department of Clinical Investigation and Research, University and Royal Infirmary of Manchester; Honorary Consulting Haematologist, Christie Cancer Hospital and Holt Radium Institute, Manchester*

In a recent communication Rotter (1937) of Budapest suggested a skin test for the estimation of the vitamin C nutrition of the body. This test depended upon the fact that 2:6-dichlorophenolindophenol is decolorized by the tissues at a rate depending upon the ascorbic acid content. Rotter had noted that when small quantities of the dye were injected into the soles of guinea-pigs decolorization took place much more rapidly in healthy animals than in those with scurvy. He suggested that this disappearance of the dye was due to reduction by the ascorbic acid and not to resorption, since methylene-blue, simultaneously injected, remained unchanged. Similar results were obtained when a solution of the dye was administered intradermally to patients on vitamin-C-rich and vitamin-C-free diets. Rotter concluded from his experiments that the time for decolorization was an indication of the saturation or otherwise of the individual with regard to vitamin C. In "saturated" cases the dye disappeared in less than five minutes, in "normal" cases in five to ten minutes, and in "deficient" cases the dye took longer than ten minutes for decolorization.

The extreme simplicity of this method as a rough indication of the vitamin C content of the tissues is obvious and, if correct, would have considerable advantages over the present methods, which, although relatively simple, are not always convenient, require much more time, and may lay themselves open to errors if the technique is not carefully controlled. Accordingly, during the course of some other investigations, we have taken the opportunity of trying Rotter's skin test in convenient groups of cases.

Method

The method employed was that used by Dr. Rotter, who kindly supplied us with some further details. The requisites are a sterile solution of 2:6-dichlorophenolindophenol, a 1-c.cm. tuberculin syringe graduated in hundredths, and an intradermal needle.

Technique

The dye solution contains 2 mg. of the solid 2:6-dichlorophenolindophenol in 4.9 c.cm. of distilled water. This solution was found to be bacteriologically sterile. Nevertheless, since we have always sterilized our solution by passage through a Seitz filter, the pad of which was found to adsorb 20 to 30 per cent. of the dye, we have made up the solution as follows: the dye is dissolved in the proportion of 4 mg. to 4.9 c.cm. of distilled water; the sterile filtrate is standardized by removing an aliquot amount with a sterile pipette and titrating it against a freshly standardized solution of ascorbic acid (standardized against N/100 iodine solution). The filtrate is then diluted

appropriately with sterile water to its correct strength (2 mg. in 4.9 c.cm.). This dye solution is freshly prepared every three to four weeks, since its strength begins to deteriorate after that time. Sterilization of the solution by autoclaving causes a 3 to 5 per cent. loss.

The site chosen for injection is the skin of the forearm in an area free from hair and small superficial veins, since the latter may cause confusion as they are the same colour as the dye. The skin is cleaned with ether and stretched, the needle is inserted intradermally, and 0.01 c.cm. of the solution injected immediately under the epithelium, a wheal 2 mm. in diameter being raised. The times of injection and of complete disappearance of the dye colour are noted. In order to minimize any error which may arise in the size of the wheal four wheals are raised and the average time for decolorization is taken in each patient.

Results

Tests have been made on a series of 103 patients who were under observation for other purposes, and seventeen of these were re-examined after complete saturation with ascorbic acid.

Group I.—This group consisted of thirty-five patients on whom (i) full and repeated ascorbic acid determina-

tions had been made by the "saturation" test of Abbasy *et al.* (1935), and (ii) direct determinations of the ascorbic acid content of the blood according to Pijoan and Klemperer's modification of the method of Farmer and Abt (1935), or by blood tolerance tests, details of which will shortly be published.

Group II.—This group comprised sixty-eight patients who did not have these full vitamin C tests but whose dietetic histories could be accurately assessed.

The patients in Group I were divided into three subgroups according to their degrees of vitamin C saturation as determined by the urinary vitamin C excretion test and by the ascorbic acid content of the blood. The normal blood ascorbic acid value as determined by Pijoan and Klemperer (1937) is 0.65 to 2 mg. per 100 c.cm.

In the unsaturated subgroup of patients before treatment the level of blood vitamin C was 0.27 to 0.52 mg. per 100 c.cm., and after complete saturation with ascorbic acid these patients when re-examined had blood ascorbic

and of these apparent successes about one-quarter develop a disintegration of the head of the femur at any period up to four or five years following the operation.

Drawbacks of the Whitman and Smith-Petersen Methods

The advantages of these two methods are evident. By their use the end-results of treatment of this type of fracture have been greatly improved; but neither method is without risk, and their true value can only be appreciated by realizing their disadvantages, which in Whitman's method are: (1) the frequency with which non-union follows on even the most careful treatment; (2) the risks to these elderly patients which follow on prolonged fixation in the very uncomfortable position of abduction and hyperextension; (3) the rigidity of the joints which is caused by the fixation and twisting of the limb over a long period. The disadvantages of the insertion of a metal pin are: (1) the risks of failure to insert the pin in the ideal position, and the very definite risk of non-union; (2) the occurrence of fragmentation in the head of the femur following an apparently successful operation; (3) the very definite risk of infection in the hands of non-experts in the method.

Treatment by Oblique Osteotomy

With these considerations in mind it was natural that one should look for some method which would allow uninterrupted apposition of the fractured surfaces without the disadvantages that have been enumerated. In 1936 I published an article on the treatment of non-union following fractures of the neck of the femur by means of an oblique division of the shaft, which is cut through at the level of the lower border of the upper fragment. Following the osteotomy the shaft of the femur is displaced inwards to such a position that its upper end rests against the lower surface of the head of the femur and the cotyloid ligament of the acetabulum. Following the osteotomy and the displacement, fixation of the whole area is maintained for three and a half months in a plaster-of-Paris case extending from the lower ribs to the foot, with the thigh and legs in the neutral position. No tension is applied to any joint, the knee being kept slightly flexed with the foot at right angles, so that the danger of rigidity following the fixation disappears, or is at least greatly diminished. After the first eight weeks the portion of the case which encloses the ankle and foot may be removed in order that the patient can exercise and retain the muscle control.

In the article mentioned I gave the detailed end-results of twenty-seven cases of non-union of the neck of the femur which had been treated by this type of osteotomy, and showed that, so long as the operation was performed as described, a satisfactory result was to be expected in every instance. The essentials for success were summarized under the following three headings:

1. Correct position of the transferred shaft of the femur under the femoral head and lower border of the cotyloid ligament.
2. Fixation following operation for a period long enough to ensure union at the site of the osteotomy, without which the hip remains flail and very painful.
3. The fixation of the limb in the plaster case in the neutral position, or in very slight abduction, in order to prevent the development of a knock-knee deformity following the removal of plaster.

Recent Transcervical Fractures

Since the time of publication of that article the operation has met with such uniform success in the treatment

of non-union that I have been encouraged to use it in the treatment of four recent transcervical fractures. The number of cases so treated is small, because I was anxious to study the final results and to discover any unsuspected complications that might follow on the use of this line of treatment in recent fractures. In each of these four cases all treatment has ceased for at least nine months, and it is therefore possible to reach a decision in regard to the value of the method. The results have been entirely satisfactory, firm bony union having occurred in each case at the original fracture and at the line of osteotomy. As a result of the operation the patients are all able to stand and walk without a limp, and with a hip-joint which is perfectly stable in every direction. In no case is there any trace of absorption or disintegration of the head of the femur—in fact, the application of pressure from the trochanteric fragment against the head of the femur has prevented even temporary "decalcification," which is so commonly seen. In one instance, in a patient in whom definite signs of creaking in the knee were already present, fixation in plaster led to a temporary stiffness of the joint, which responded to physiotherapy in three months. The only real disadvantages that I can find are a shortening of about one-half to three-quarters of an inch and a loss of the power of adduction of the thigh across the middle line of the body. The limb can be abducted fully, and adducted freely and easily to the middle line of the body, but the extreme normal adduction across the middle line is lost, a loss which is of no great importance.

Operative Technique

The details of the treatment are as follows. If shortening is already present when the patient is seen for the first time, full length of the limb should be restored by traction applied by means of adhesive strapping to the

FIG. 1.—Fracture of the neck of the femur, showing line of osteotomy.

thigh and leg. Two or three days are quite sufficient to produce the necessary correction, and if there is at the same time a tendency to eversion of the limb this may also be corrected by the use of sandbags and by pressure on the outer side of the bent knee. When full length has been obtained the operation is carried out: an incision five inches in length is made along the outer border of the femoral shaft, extending downwards from the tip of the great trochanter. The muscles attached to this portion of the bone are completely raised from the anterior aspect, so that the lesser trochanter and lower border of the neck of the femur can be clearly seen. When the exact position of these different bony points has been decided an oblique osteotomy is made in the shaft of the femur,

FRACTURE OF THE NECK OF THE FEMUR TREATED BY OBLIQUE OSTEOTOMY

BY

T. P. McMURRAY, M.B., M.Ch., F.R.C.S.

Honorary Orthopaedic Surgeon, David Lewis Northern Hospital, Liverpool; Director of Orthopaedics and Lecturer in Orthopaedic Surgery, Liverpool University

No single surgical problem has received greater consideration during the past ten years than that of fracture of the neck of the femur. The difficulties met with in the treatment of fractures in this region were recognized by and mentioned in the writings of the earliest surgical authorities. To them the problem of obtaining bony union appeared to be insoluble, and their conclusions can best be summarized in the statement, "Fractures of the neck of the femur always result in non-union."

With the advance in the technique of radiography it was discovered that fractures of this part of the thigh-bone did not always occur at the same level, and that the prognosis as regards union depended on the site at which the line of fracture appeared. Thus, even with inadequate treatment, fractures of the base of the neck close to or impinging on the great trochanter almost invariably resulted in sound bony union, with or without deformity.

Fractures occurring nearer the head of the femur—the so-called transcervical or subcapital fractures—on the other hand, did not show this power of union, and as a result of the treatment, or rather want of treatment, which was common at that time non-union was to be expected in every instance. This attitude of defeatism and submission to the apparently inevitable was practically universal until the writings of Royal Whitman stimulated interest in the subject, and indicated that the problem, although difficult, was far from insoluble. By his work he proved that the uniformly bad results previously obtained were inevitable, as the popular treatment by sandbags and weights did not produce even approximate apposition of the broken surfaces, which is essential to the union of a fracture in any region. He also showed that these broken surfaces could be brought together by manipulation of the leg and hip, and that when this reduction of the displacement had been completed bony union was to be expected in a very large percentage of cases if fixation of the fractured surfaces was maintained for a sufficient period.

The Whitman Method

The technique of manipulative reduction as used by Whitman consisted in extension of the limb, followed by abduction to the fullest degree and complete internal rotation of the whole limb, after which he believed, on the evidence of a single x-ray photograph taken in the antero-posterior plane, that the fractured surfaces must be in apposition. The method of retention of the fractured surfaces consisted in the application of a plaster case extending from the thoracic wall to the toes of the affected side, the whole limb being fully abducted and internally rotated with the hip fixed in hyperextension.

Following his writings the treatment of the fracture was revolutionized, and the results were vastly improved, so that in the hands of a careful surgeon bony union was obtained in 50 per cent. to 60 per cent. of fractures, even of the transcervical type. Although this method was such a great advance on any previous form of treatment,

it had several serious drawbacks. Probably the greatest of these was the unavoidable fixation of the limb in a most uncomfortable position of extreme abduction with hyperextension at the hip-joint—a position preventing any attempt at sitting up and rendering the patient liable to the development of complications, of which the most serious was hypostatic pneumonia. The second great disadvantage of this method was the rigidity that so frequently followed prolonged fixation of joints in which some arthritic changes were probably already present. The third objection to the method was the very grave one that, even when carried out exactly according to the author's technique, non-union resulted in at least 40 per cent. of the cases.

The Smith-Petersen Operation

The next real step forward came from Smith-Petersen, who based his treatment on the belief that union of this fracture can only occur when, correct apposition of the fractured surfaces having been obtained, movement is prevented until union is complete. In order to obtain the necessary reduction and fixation he devised a method of treatment in which, by open operation, the fractured surfaces were brought into apposition and secured by means of a triradiate steel pin, which was inserted through the great trochanter, along the neck, and into the proximal fragment. This method, which has been modified in several details, has been used very extensively, and its enthusiastic disciples have claimed for it results far beyond those put forward by its originator.

The advantages of such a method are obvious. First, if the fragments can be securely held by such a pin, then fixation in plaster-of-Paris, with its great disadvantages, becomes unnecessary. Secondly, if the presence of a mass of metal does not counteract the advantages obtained by accurate apposition, then such a method, when correctly employed, should result in union in every instance. The method has, however, several disadvantages which may not be quite so obvious. Thus even in the most expert hands the operation is a serious one, involving considerable shock to the patient, and not always resulting in the placing of the pin in the desired position. If such a mishap should occur the operation may appear to be successful, but later, when walking is resumed, the small friable upper fragment cannot hold the pin, which cuts out through its upper border, leaving the patient more disabled than before. Another very serious drawback to the method, and one that has only recently been generally recognized, is the disintegration of the small proximal fragment which follows the operation in a certain percentage of patients in whom the pinning has apparently been successful.

This condition of disintegration—or, as it has been described, aseptic necrosis of the head of the femur occurring after apparently firm bony union—has been reported by Henderson to have taken place in 25 per cent. of his successful results. It is difficult to give an explanation of this complication, which may appear within a few months of the operation or at any time within the next two or three years. Probably it results from the presence of a large metallic mass, which causes a further diminution of the blood supply to an area of bone that is normally poorly nourished.

The results of the operation of pinning for fracture of the neck of the femur may therefore be summarized as follows. Disregarding the small percentage of patients who succumb to the operation on account of immediate or delayed shock, or from complications, bony union is to be expected in 70 per cent. to 80 per cent. of cases.

union is firm, and the shortening is slightly less than half an inch.

Case 3.—A woman aged 55 had a transcervical fracture of the neck of the femur. She was operated on three days later by oblique osteotomy and fixed in plaster for three and a half months. She is now walking well without pain and with perfect stability. There is good union of all three fragments.

Case 4.—A woman aged 54 sustained a transcervical fracture of the neck of the femur. She was operated on six days later by oblique osteotomy. After three and a half months' fixation in plaster union was complete in all three fragments. The patient is now apparently normal, without disability or pain, although there was temporary stiffness in the knee-joint for three months. This was cured by massage and voluntary movements, and did not prevent the patient from walking at any time.

A POSSIBLE DISCREPANCY IN THE ESTIMATION OF ASCORBIC ACID IN URINE

BY

G. W. T. H. FLEMING, M.R.C.S., L.R.C.P., D.P.M.

Medical Superintendent, Barnwood House, Gloucester

AND

T. E. BURROWS, M.R.C.S., L.R.C.P., D.P.M.

Medical Superintendent, Hereford Mental Hospital

Tests have recently been evolved for the estimation of ascorbic acid in urine, and these have been used for the diagnosis of latent and subclinical scurvy. The main difficulty in their clinical application lies in the collection of specimens of urine passed during the night and early morning, since it is recognized that ascorbic acid is rapidly oxidized on standing, even when kept in dark tightly stoppered bottles; and because ascorbic acid is not excreted at a uniform rate a twenty-four-hours test at least is essential. It has been shown by Borsook *et al.* (1937) that in an alkaline medium ascorbic acid can be oxidized into dehydroascorbic acid, and further still, into 2:3-diketogulonic acid; but this latter reaction is not reversible, so that the passage of H_2S through the solution, although it converts the dehydroascorbic acid back to ascorbic acid, does not touch the diketogulonic acid, which is lost. The irreversible change from dehydroascorbic acid begins at a pH of about 4 and increases as the pH rises. In order to overcome this difficulty preservatives have been added to the urine in the form of acetic acid and sulphuric acid.

Although some workers appear to be aware of the destruction of ascorbic acid by sulphuric acid, it has seemed worth while to us to publish this paper. Youmans *et al.* (1936) used 10 per cent. 2N sulphuric acid as a preservative, and Mack and Tressler (1937) mention using 5 per cent. sulphuric acid for the inhibition of the oxidase present in vegetable juices.

The Relative Efficiency of Acetic and Sulphuric Acids

Before proceeding with the clinical application of these tests it occurred to us to examine the relative efficiency of these two acids. The micro-method of Birch *et al.* (1933) was used, with the exception of a teat pipette in place of a micro-burette. For this purpose specimens of fresh urine were employed, samples of each being tested by both methods, the urine being kept in dark bottles throughout the experiment. Control experiments with the same specimens of urine to which nothing was added were carried out simultaneously. It was found that at the end of twenty-four hours the readings of the two tests corresponded closely with a loss of 15 per cent. to 21 per

cent. of the reducing substance, the controls showing 26 per cent. to 31 per cent. loss. At the end of forty-eight hours the loss with sulphuric acid only increased by 2 per cent. or 3 per cent.; the loss with acetic acid rose to about 50 per cent., while the loss with untreated urine varied from 80 per cent. to 100 per cent.

With a view to still further checking these results the tests were repeated, but using solutions of ascorbic acid in water instead of urine, the concentration of ascorbic acid being kept similar to that usually found in urines so far tested. These tests showed that during the first five minutes the loss with solutions of 1 per cent. sulphuric acid was 20 per cent., with acetic acid 5 per cent., and with water 15 per cent. (In dealing with the aqueous solutions the acid necessary for the test was added at the moment of titration.) After twenty-four hours the loss with acetic acid varied from 27 per cent. to 36 per cent., while that occurring with sulphuric acid and unacidified solutions was in every case 100 per cent. Tests with sulphuric acid in higher concentrations up to 20 per cent. gave a correspondingly greater loss of ascorbic acid in the same time.

From these results it is clear that sulphuric acid tends to destroy rather than preserve ascorbic acid in aqueous solutions.

Reasons for Apparent Difference in Action

To account for the apparent difference in the action of sulphuric acid on ascorbic acid in aqueous solutions and those containing urine it was necessary to postulate one of three possibilities: (i) there was some reducing substance in the urine apart from ascorbic acid which was preserved by sulphuric acid; (ii) the urine in conjunction with sulphuric acid had a preservative action on ascorbic acid; (iii) the substance tested for was not ascorbic acid. In order to elucidate this problem two other tests were performed.

1. A known quantity of ascorbic acid was added to fresh urine in which the amount of reducing substance had been previously estimated, and the above tests were repeated on the resulting solutions.

2. Urine was allowed to stand until tests for the reducing substance were negative. To this were added known quantities of ascorbic acid, and the above tests again repeated, using samples of the same specimens of urine for each; in each case controls with the same amount of ascorbic acid in water, 1 per cent. sulphuric acid, and 5 per cent. acetic acid were carried out.

From these experiments the following results emerged:

In the experiment with urine containing a measured quantity of titrable substance the loss during the first five minutes with unacidified solutions and those acidified with 5 per cent. acetic acid was never more than 3 per cent., and the former always exceeded the latter by at least 1 per cent.

In the case of the solution acidified with 1 per cent. sulphuric acid the loss varied from 12 per cent. to 19 per cent. so that there appears to be an immediate destruction of ascorbic acid on the addition of sulphuric acid, the readings being only slightly lower than those obtained with ascorbic acid in water acidified with 1 per cent. sulphuric acid.

It was next found that during the following twenty-four hours the loss of titrable substance proceeded more slowly in sulphuric acid solutions than in aqueous solutions (28 per cent. compared with 45 per cent.) and only slightly more rapidly than in the case of acetic acid, which gave about 22 per cent. loss in the twenty-four hours subsequent to the first five minutes.

In the tests in which ascorbic acid was added to urine kept until all titrable substance had disappeared the results followed very closely those obtained with ascorbic acid in solution in water, sulphuric acid, and acetic acid.

as in Fig. 1, its lower border on the outer margin being slightly below the level of the lower border of the lesser trochanter, while it terminates on the inner side between this bony prominence and the lower aspect of the neck. After completing the osteotomy the limb is rotated by grasping the knee and twisting the thigh inwards and outwards, so that there may be no locking between any bony projections on the cut surfaces, which might obstruct the inward displacement. The shaft of the femur is now displaced inwards, partly by abduction of the limb, which enables the two cut surfaces to slide on each other, and finally by digital pressure on the upper and outer aspect of the lower fragment so that there may be no doubt as to its complete inward displacement. This displacement constitutes the essential part in the operation. It must be complete, so that the upper end of the lower fragment lies directly under the head of the bone (Fig. 2).

FIG. 2.—After displacement inwards of the shaft of the femur, showing the tilting of the head and of the trochanteric fragment.

If the surgeon is satisfied with any lesser displacement, then the essential point of the operation is lost, and the osteotomy will simply result in a pushing upwards of the trochanteric fragment.

The displacement being completed the position of full abduction may now be altered and the limb brought down to a position of not more than 20 degrees abduction. This alteration from the angle of full abduction is a most important step in the operation. If it is not carried out the presence of the femoral shaft in the abducted position prevents the rotation inwards of the upper fragment under the head of the femur—a position which is essential for the promotion of bony union in the original fracture, as shown in Fig. 2. After displacement of the shaft inwards the upper divided fragment, consisting of the great trochanter and base of the neck of the femur, must rotate inwards at its lower border on account of the common muscular attachments of the two fragments. Because of their close apposition the rotation of the trochanteric fragment produces a similar rotation of the head of the femur, so that the line of the cervical fracture, which was originally more or less vertical, is now almost transverse, and so long as this position is maintained muscular pull simply produces greater pressure between the broken surfaces. There is therefore a true coaptation of the broken surfaces in the original fracture, and this apposition cannot be altered because the shaft of the femur, lying in its new position, acts as a rigid strut.

No suturing, pinning, or wiring is necessary to retain the fragments in place, as the normal muscle tension keeps

the shaft of the femur in its new position. Fixation is obtained by the application of a plaster spica, extending from the lower ribs to the middle of the foot, which is held in the neutral position, the hip- and knee-joints being kept in slight flexion. After three and a half months' fixation the plaster case is removed, and the patient is treated for two weeks by non-weight-bearing exercises, which help to restore the muscle power that has been diminished by the fixation in plaster. No splint or surgical apparatus is then necessary or advisable, and walking can be resumed with complete confidence, as this period of fixation is always sufficient to obtain firm bony union between the two divided fragments of the shaft of the femur.

The operation is a simple procedure, giving but little shock to the patient, and can be performed successfully by any competent surgeon without the help of repeated x-ray photographs or an elaborate team of assistants. It has one outstanding advantage over the other two methods; when failure results from treatment by pinning or by Whitman's method of plaster fixation, the patient is left with an unstable weak hip, which must remain as a permanent disability or require some other extensive surgical procedure. If this operation by osteotomy does not succeed in producing a bony union at the original fracture in the neck of the femur it leaves a hip-joint that is perfectly stable, on which the patient can walk without discomfort and without pain, and with only one-half to three-quarters of an inch shortening. This point, of course, is of the very greatest importance, because these elderly patients should not be subjected to operations of which the results are doubtful, and the essential feature of this method is that the whole treatment is restricted to one surgical procedure.

The after-treatment by fixation in plaster might be considered as being open to the same objections as those of Whitman's method, and as one likely to be followed by troublesome rigidity, especially of the knee-joint; but this objection does not hold, as in this case there is no torsion of the limb and consequently no continued strain on the joint, which lies comfortably in slight flexion in its plaster case. In addition the avoidance of the position of hyperextension at the hip-joint is of the greatest help in diminishing the shock and the possibility of post-operative complications.

Illustrative Cases

The details of the cases treated are as follows.

Case 1.—A man aged 38 sustained a transcervical fracture of the femur, which was treated by rest in bed for five weeks. On examination there was half an inch shortening with considerable eversion of the limb. The position was corrected in four days by a weight extension, and after confirming it by radiographs an oblique osteotomy was performed. After three and a half months' fixation the plaster case was removed when fresh radiographs showed that bony union had occurred between all three fragments of the femur. The man can now walk five miles without any discomfort, and can ride a horse and swim with ease.

Case 2.—A man aged 45 who suffered from complete paralysis of both legs following an attack of infectious paralysis at 20 years of age. He had been able, with the use of crutches, to get about his garden and to work in the field, and the x-ray photographs showed that all the bones of the lower limbs were smaller and thinner than normal. Following a transcervical fracture two days previously there was three-quarters of an inch shortening of the affected leg, with some eversion. Full length and position were readily obtained by gentle pull, and the osteotomy was completed as described. The patient can now do all he could before his accident.

than British, possibly because in this country a greater distinction is drawn between pyloric stenosis and pyloric spasm, with the result that only the more severe cases are included in any given series.

As soon as Svendsgaard's paper was published treatment by eumydrine was started in the Children's Hospital of the Leicester Royal Infirmary, and has since been adopted as the routine treatment. Although the results have not been as brilliant as Svendsgaard's, they compare favourably with those of surgical treatment, and there is reason to believe that they will become progressively better. Svendsgaard's routine has been closely followed in this series—that is to say, the patients are given subcutaneous saline until diuresis demonstrates that dehydration has been overcome, then 5 c.cm. of a freshly prepared 1 in 10,000 aqueous solution (0.5 mg.) of eumydrine is administered orally half an hour before feeding. The children are breast-fed if possible: for the bottle-fed half-cream dried milk is used. Twenty-one babies have received this treatment. Three were nursed in a private hospital and eighteen in the Children's Hospital. (One baby who was admitted with pyloric stenosis during this period is not included in this series. He was premature, bottle-fed, and febrile. Eumydrine was tried for a few days, and although there was some improvement in regard to the vomiting the child was so ill that it was thought that surgical measures would give him the best chance. Rammstedt's operation therefore being performed. The child died from respiratory infection soon after.)

The three patients in the private hospital all recovered. Of the eighteen in the Children's Hospital three died, and in three eumydrine was apparently ineffective: two of these last were cured surgically, and one by means of syntropan (see below). The total mortality, therefore, was three out of twenty-one patients, or 14.3 per cent. Surgical statistics for the four previous years show a mortality of 23 per cent., ranging from no deaths in eight cases in 1933 to five deaths in twelve cases in 1932.

Of the deaths two occurred from secondary infection (pneumonia) after the pyloric stenosis had apparently been cured. In one of these cases arrangements had actually been made to discharge the patient, when he developed his fatal infection. Since the occurrence of these deaths each child has been nursed in a cubicle, and from that time secondary infection has been unknown in the eumydrine series. The other child died suddenly while taking a breast-feed. This may have been due to alkalosis, and now each patient receives 2 grains of ammonium chloride thrice daily while the vomiting continues.

Seventeen of these twenty-one babies were bottle-fed, so that a high mortality rate was to be expected; the figure of 14.3 per cent. cannot therefore be regarded as unsatisfactory, particularly when the individual fatalities are considered. The average duration of treatment was five and a half weeks, the shortest being two and a half weeks and the longest twelve weeks. Both the last-mentioned were private cases: the one which lasted twelve weeks developed mercism, which greatly prolonged his stay in hospital.

Treatment by Syntropan

As considerable success was experienced from the treatment of infantile pyloric stenosis by eumydrine, of atropine methyl nitrate, it was thought possible that equally good or even better results might follow the use of syntropan, the acid phosphate of dimethyl-dimethylaminopropanol ester of tropic acid, since that compound was stated to

be effective in the treatment of sea-sickness. The first baby to be treated by this drug was one in which eumydrine had apparently failed. After a month's treatment he had not gained weight and was still vomiting. He was then given 10 mg. of syntropan suspended in 2 c.cm. of water orally before each feed. Vomiting practically stopped immediately, but there was a little regurgitation for three weeks, during which time he gained over a pound in weight. He was discharged cured a month after the beginning of treatment by syntropan.

The hopes of success anticipated from this case, however, have not been realized in two subsequent patients. One of these, although the vomiting diminished and the bowels became more regular, developed pneumonia and died six days after admission, in spite of being nursed under conditions of isolation: the other did not respond to syntropan, and after four days of vomiting was treated by eumydrine. This apparently relieved the pyloric stenosis, and he lost all his symptoms and began to gain weight rapidly. Suddenly, however, he developed a temperature of 103° F. and died in a few hours from lobar pneumonia.

Conclusion

The standard of diagnosis adopted was radiological. Although in the great majority of cases visible peristalsis, projectile vomiting, and a palpable pyloric tumour formed a diagnostic triad, in a few cases the pyloric tumour was not felt. At first only these cases were radiographed, but later all were examined radiologically as a routine, as this presents the best method of differentiating pyloric stenosis from pyloric spasm and eliminates any personal factor. I do not myself consider this necessary, since it seems illogical to make two diseases of two conditions of identical age incidence and symptomatology, which are cured by the identical treatment, and which are differentiated only by one physical sign. But in view of the fetish made of the palpable pyloric tumour by many clinicians, radiological diagnosis was considered desirable for the purpose of recording cases.

The efficacy of eumydrine in the treatment of pyloric stenosis has been confirmed, and in the few cases in which it is not successful it is possible that treatment with some other tropic acid derivative such as syntropan will succeed. Further observations are being carried out regarding the place of this and other drugs in the treatment of the condition. Already, however, it is apparent that the problem in the medical treatment of infantile pyloric stenosis is not so much the failure of the antispasmodic as the liability of the patient to secondary infection.

Acknowledgments are due to Messrs. Bayers and to Roche Products Ltd. for the supply of eumydrine and syntropan respectively.

In the December number of *Colorado Medicine* H. J. Corper pays a graceful tribute to the Viennese pathologist Anton Ghon (1866-1936), who twenty-five years ago described what has since been called the "Ghon tubercle." This periodical, beginning with the January, 1938, issue, has changed its title to *Rocky Mountain Medical Journal*, and at the same time has become the official journal of the Utah State Medical Association.

These results would appear to throw doubt not only on the efficiency of sulphuric acid as a preservative for ascorbic acid but also on the nature of the reducing substance in the urine as measured by these tests. In any case an explanation is obviously required to account for the fact that ascorbic acid in the presence of urine and sulphuric acid is destroyed, while the reducing substance in urine, as measured by these tests and presumed to be ascorbic acid, is preserved by sulphuric acid of the same strength. Incidentally it may be pointed out that the loss of reducing substance in lemon juice when kept for twenty-four hours in 1 per cent. sulphuric acid is 100 per cent.

Table showing Loss of Reducing Substance in Tests with Sulphuric and Acetic Acids

	Loss of Reducing Substance	
	First Five Minutes	Subsequent 24 Hours
Ascorbic acid in water	10	100
" " 1% sulphuric acid	20	100
" " 5% acetic acid	5	29
Reducing substance in urine		31
" " " +1% sulphuric acid ..		16
" " " +5% acetic acid ..		19
Ascorbic acid and tested urine .. .	2	45
" " " " + sulphuric acid ..	16	28
" " " " + acetic acid ..	1	22
Ascorbic acid and non-reducing urine .. .		100
" " " " + sulphuric acid		89
" " " " + acetic acid ..		31

A Possible Difficulty due to Catalysis

It was suggested to us that a possible difficulty in this work is due to catalysis of the oxidation of ascorbic acid by traces of copper present either (a) in ordinary distilled water or (b) in the sulphuric acid. Stotz *et al.* (1937) also state that the sensitivity of ascorbic acid to aerobic oxidation when copper is present as a catalyst is perhaps its most striking characteristic *in vitro*. Lyman, Schultze, and King (1937) point out that the instability of ascorbic acid in weakly acid solutions is due to the copper content of the solution, and that by its strict elimination ascorbic acid solutions are stable below a pH of 7.6. These authors used metaphosphoric acid, which inhibits the copper-catalysed oxidation of ascorbic acid by decreasing the amount of copper effective in the catalysis.

However, if the copper is present in the sulphuric acid the question still remains as to why there is a difference in the rate of destruction of the reducing substance in fresh urine in the presence of sulphuric acid (? + copper) and the rate of destruction of ascorbic acid which has been added to fresh urine in the presence of the same reagent. It also fails to account for the fact that there is an immediate (five minutes) loss of ascorbic acid in fresh urine with sulphuric acid (? + copper) of about 16 per cent., while the loss in the same time with acetic acid is only 1 per cent. (The catalysis should be inhibited by fresh urine.) The only distilled water employed in these two tests is that used to dissolve the dye, and this would be present equally in all these tests. With regard

to the occurrence of copper in the distilled water used in the other tests, if it is present it would appear to make the test unreliable for clinical purposes—at any rate, where sulphuric acid is used.

Van Eekelen (1936) has pointed out that ergothioneine and thiosulphates both reduce 2:6-dichlorophenolindophenol and that these substances must be removed by precipitation with mercuric acetate. In view of the fact that even with acetic acid there is a destruction of ascorbic acid on keeping, it is quite obvious that the results obtained will be of very doubtful value, unless the titration is carried out immediately after voiding. Although to do this may appear clinically tedious, it is scientifically sound, for examination of twenty-four hours' urine is necessary.

Summary

Sulphuric acid, which was still being used to "preserve" ascorbic acid in twenty-four-hour specimens of urine at the time of writing, has been shown to destroy ascorbic acid even when used in a concentration of 1 per cent.; with stronger solutions the destructive effect is greater still.

TREATMENT OF INFANTILE PYLORIC STENOSIS BY ANTISPASMODICS

BY

J. VERNON BRAITHWAITE, M.D., M.R.C.P.

Physician in Charge of the Paediatric Department,
Leicester Royal Infirmary

The majority of observers regard infantile pyloric stenosis as essentially a disorder of the neuro-muscular apparatus of the gastric outlet, rather than as the result of a hypertrophy of the pyloric muscle of unknown origin. It might have been expected, therefore, that this condition would respond well to medical treatment, but until recently experience has shown that this is not the case. Parsons (1933) states that only 20 per cent. of patients recover if treated medically, whereas a recovery rate of 80 per cent. can be anticipated if Rammstedt's operation is performed. Thompson and Gaisford (1935) in a review of 209 surgical cases find that the death rate was 14.4 per cent. Recently, it is true, Harris and Keynes (1937) have reported thirty-six cases treated surgically with only one fatality (2.8 per cent.), but these figures are exceptional in this country. As a rule surgical treatment may be expected to cure few patients out of five with this complaint, while with the older methods of medical treatment the majority of cases ended fatally.

Treatment by Eumydrine

In December, 1935, Svensgaard published the results of treating congenital pyloric stenosis with eumydrine, or atropine methyl nitrate. Only two of sixty-one patients died, giving the remarkably low mortality rate of 3.3 per cent. (or 1.6 per cent. if one death attributed to pyelonephritis is omitted). In this connexion, however, it must be remembered that foreign statistics are invariably based

Reviews

STANDARDIZATION OF VITAMINS

The Biological Standardization of the Vitamins. By Katharine H. Coward, D.Sc. (Pp. 228; 44 figures; 29 tables. 12s. 6d.) London: Baillière, Tindall and Cox. 1938.

For the purpose of her monograph Dr. Katharine Coward set out to gather together information that may be "of service to those workers who are engaged in the determination of the vitamin potency of food, of special preparations for therapeutic purposes, or of products obtained in the course of investigation of the chemical nature of the vitamins." In this task she has succeeded admirably. The book does not attempt to be a review of methods which are still in the process of elaboration. She has confined herself to those vitamins in which methods have been fully worked out and which she knows to be of value. In the preface she states: "I have drawn largely from my own experience, but I have been fully aware that in many laboratories the technique must be quite as good as my own and more suitable to the local conditions than my own could be. I have therefore dwelt largely on the principles which should underlie biological determination of the vitamins, giving details of my own or other techniques only as I myself know them to be good." In effect she has confined herself entirely to vitamins A, B₁, C, and D.

The first half of the book is given up to general principles, to a consideration of the animals suitable for biological standardization and the conditions under which they should be kept. Then she considers separately the various methods available for standardization of the four vitamins mentioned. This is followed by a chapter on the interdependence of the vitamins, in which Dr. Coward shows that in standardizing any given vitamin it is essential that the content of other vitamins in the animals' diet should be optimal. She finds that excess of other vitamins does not affect the conditions of standardization, and therefore it is wiser to err on the side of generosity. In the second half of the book she devotes some space to an admirably brief and simple examination of statistical methods designed to show how much the results are affected by variations between individual animals. Finally she considers statistically each of the methods she has described from the point of view of the accuracy obtainable. In each case Dr. Coward gives several different methods. Thus, for vitamin B₁ she describes four methods—namely, the cure of retracted neck in pigeons, the growth test in rats; the cure of convulsions in rats, and the cure of bradycardia in rats.

In the appendix there is a brief account of the second conference of the League of Nations Commission on Vitamin Standardization, and a table showing the vitamin content of some foods, expressed in international units per gramme. The book is carefully written, concise, and very clear, and should be well received.

SYPHILIS FOR THE MILLION

Ten Million Americans Have It! By S. William Becker, M.S., M.D. (Pp. 220; 6s. net.) Philadelphia. London. Montreal, New York: J. B. Lippincott Company. 1937.

The lay public is extraordinarily ignorant about venereal disease, and has very little idea of the prevalence of syphilis: a perusal of *Ten Million Americans Have It!* by Dr. S. William Becker, will cause it to open its eyes—

as it is meant to do. This book is written primarily for the layman, but many medical practitioners will find much information in it which they did not possess before. Few people realize the ravages of syphilis, and still fewer have any idea of the extent of its prevalence.

America is becoming "syphilis-conscious," and a campaign is in motion to bring home to people the importance of the disease, the necessity for treatment, and the means of eradicating it. Dr. Becker's book puts the matter in such a way that the layman can understand how widespread the disease is, how it is acquired, what its effects are, how it may be treated, and how eventually it may be stamped out; in this respect it fills a gap, for no publication of this sort has appeared for many years. The author knows his subject, since he is associate professor of dermatology and syphilology in the University of Chicago, and though a large part of the work is technical any ordinary person will be able to grasp his meaning.

Such a well-written monograph is almost above criticism, but is it a fact that "the majority of patients with syphilis will go through the early stages of the disease without suspecting its presence" (p. 118); and will three injections of neoarsphenamine in five days always prevent the development of the disease if given from eight to forty-eight hours after exposure to infection (pp. 146-7)? We hope that this excellent book will have a wide circulation here as well as in America, and so make plain to the public the dangers of venereal disease and the necessity for taking all possible steps to stamp it out.

THE ABNORMAL PERSONALITY

An Introduction to Abnormal Psychology. By V. E. Fisher. Revised edition. (Pp. 533. 12s. 6d. net.) New York: The Macmillan Company. 1937.

A second edition of this book has appeared after seven years; much of it has been rewritten, though the general plan has been retained. After remarking how commonly we meet with abnormal persons and how often we may detect the abnormal psychological reaction in ourselves and in each other, the author adopts the wise plan of proceeding from the normal to the abnormal. He points out that the personality is the sum total of all aspects of the individual and of all the mechanisms of which he is made up and which he employs, and deals not only with the average normal but with variations encountered. He discusses introversion-extroversion at some length as well as other psychological variants, and also biological variants such as those described by Kretschmer. He then proceeds to discuss the adjustment of the personality to life, and contends that if this adjustment is to be satisfactory the individual must direct his interests and efforts towards future ends: he must achieve by his efforts a reasonable satisfaction of his own desires: his overt activities must be in reasonable accord with the dictates and demands of his group; and his inclinations must tend towards the perpetuation and future welfare of the race. The different methods of reaction to difficulties are next discussed: satisfactory methods, such as overt or implicit trial and error and inhibitory reactions; less satisfactory methods, such as compensations, rationalizations, and overreactions; still less adjustive methods, such as perseverations, negativism, regressions, and infantile reactions; and finally unsatisfactory reactions such as repression, self-repudiation, projection, and what the author calls undoing.

This leads naturally to the psychoneuroses, which the author describes under the headings of neurasthenia; anxiety neuroses: phobias, obsessions, and compulsions; hysteria; and multiple personalities. To Dr. Fisher the term "neurasthenia" has a connotation different from that

Clinical Memoranda

Extra-uterine Pregnancy with Several Months' Retention of Dead Foetus

A case of what appeared to be a full-term ovarian pregnancy is here reported.

CASE RECORD

On April 27, 1937, the patient, a mestiza or half-caste, was admitted to the Urco Mission Clinic suffering from a large abdominal swelling and complaining of general ill-health. Abdominal and vaginal examination showed the presence of a hard globular slightly movable tumour arising in the pelvis, corresponding in size to that of a full-term uterus, but independent of the uterus, which was of normal dimensions and pushed to the right. The cervix was hard and easily reached.

The patient was a widow aged 30, having lost her husband in April of the previous year, and she worked as a cook. Menstruation began when 12 years of age: cycle 3/28, with normal loss. A 3-para, her first pregnancy ended in the seventh month, the second and third normally at full term. Her youngest child was 3 years of age. There were no abortions. In January, 1936, she had a normal period, beginning on the 8th. In February she menstruated from the 1st to the 20th, and in the middle of this period began to suffer from nausea and vomiting at any hour of the day. The vomiting was not excessive, but continued almost daily until June. On May 15 she first noticed quickening, and movements continued up to November. There was amenorrhoea from March to the beginning of November. In September she suffered from a severe attack of pain, which lasted for nearly a week and which she imagined to be labour pains. Following this she began to complain of "general ill-feeling" and spasmodic abdominal pains that came and went for two months. There had been secretion in the breast throughout all this period, for she had only weaned her 3-year-old child in April. In November, during the first week, the abdominal pains increased in severity, and this condition was accompanied by a moderate loss of blood during fifteen days. In the first week each of December, January, and February she had a normal four-day period. During this time the abdominal swelling had not increased in size, but there was a progressive deterioration in health, with constipation and insomnia.

On May 1, 1937, I opened the patient's abdomen under spinal anaesthesia through a median subumbilical incision. The omentum was moderately adherent to the anterior and superior surfaces of the tumour wall and was easily separated with the fingers. The tumour had a pedicle, four inches wide and one and a half inches long, consisting of a double layer of thickened peritoneum with a few moderate-sized vessels, and with what appeared to be the cord-like left tube stretched across it. The pedicle was ligatured and cut without difficulty and the tumour lifted out. A little free serous fluid was present in the pelvis. The uterus, right ovary, and tube were normal; the left ovary could not be found. The abdominal wall was closed in layers.

The tumour consisted of a sac completely pressed about a fully developed female child. There were no anatomical deformities. The fibrous wall of the sac had a uniform thickness of 3 mm., except for a thickened portion having a diameter of five inches which served as the placenta and into which the eighteen-inch cord had a battledore-type insertion. The inner wall was lined by a thin and a thick membrane. A little dark gelatinous liquor amnii was present, while a great quantity of yellow meconium covered the surface of the child. The sac and "placenta" weighed three-quarters of a pound and the foetus 7½ lb.

The foetal tissues had a plasticine-like consistency that received and retained digital impression. Skin—cream-coloured—and patches of lanugo were present over the right shoulder and over the lower lumbar region. The hair of the foetus

was black and long, and that on the side of the scalp which had received the pressure of the sac wall separated off with slight rubbing. The eyeballs were markedly shrunken and were hidden deep in their sockets. The mucous membrane of the mouth was grey. The nails reached well beyond the finger-tips. The chest wall was collapsed; the anus and vaginal opening were widely patent; the intestines were dark grey in colour and empty. The heart was shrunken and contained a little dark, thick semi-gelatinous fluid.

On May 29 the patient was discharged well. Four months afterwards she reported an abortion in the third month.

RONALD H. PAYNE, L.R.C.P. & S.,
Superintendent, Urco Clinic.

Cuzco, Peru.

A Modified Cholecystectomy

The following account of a modified technique for cholecystectomy may be of interest.

TECHNIQUE OF OPERATION

The gall-bladder is exposed and the cystic duct and artery ligated. Doyen's clamp is then applied firmly in close apposition to the liver along the peritoneal attachment of the gall-bladder, in such a way that the points of the clamp meet the ligature which secures the cystic duct and artery. A bowel clamp is next applied parallel to the Doyen's clamp, and one-twelfth of an inch or less away from it. An assistant steadies the clamp and exerts a gentle downward traction while a scalpel blade divides the tissues between the two clamps, being kept close to the Doyen's clamp. An ordinary gall-bladder clamp is then attached to the cystic duct close to its ligature, and the duct is cut across between the clamp and the ligature. The freed gall-bladder is now removed with its clamps *in situ*.

With a full-curved round-bodied needle six to eight inches of No. 2 chromic catgut are then transfixed and tied at the end of the Doyen's clamp and adjacent to the cystic duct ligature. The same thread then lightly oversews Doyen's clamp to the extremity of the previously severed gall-bladder attachment. Doyen's clamp is then withdrawn and the running suture pulled tight and locked. A thin bloodless line of peritoneal tissue will then be found to represent the previous attachment of the gall-bladder.

COMMENT

This method has the following advantages: (1) there is no oozing of blood such as occurs during dissection of the gall-bladder from the liver; (2) a running suture can be applied in about one-quarter of the time occupied by the somewhat tedious method of dissection; and (3) there is no possibility of puncturing the gall-bladder. It is obvious, of course, that this new technique is not suitable for every case. It will be found of value, however, in many cases of empyema of the gall-bladder, for a minimum of soiling of tissues is incurred.

CECIL F. TUCKER, M.B., B.S.

Brighton, Victoria.

examinations but also to graduate nurses and health visitors, and to persons less intimately associated with the tuberculous patient, such as almoners and sanitary inspectors. The book covers every aspect of tuberculosis, and deals fully and understandingly with nursing details and the relations of patient and nurse. It lays, however, too much stress on the principle of auto-inoculation as the basis of treatment in a sanatorium, which, moreover, is made to appear too much an educative centre and too little an institution in which active treatment is, or should be, carried out: and simplification of the indications for special forms of treatment, such as artificial pneumothorax, phrenic interruption, and sanocrysin, has been achieved at the expense of accuracy in the most modern light. Finally, some of the material included is really unnecessary, such as the treatment by nascent iodine, the description of the various tuberculins or the preparation of their dilutions. The illustrations, except for the badly reproduced chest skiagrams, are very good indeed, and a special word of commendation must be said in regard to the summaries at the end of the chapters and the glossary of technical terms at the end of the book. Altogether this is the best book we know of on tuberculosis for nurses.

Notes on Books

The Dissection and Study of the Sheep's Brain, by Mr. JAMES WILKIE of Guy's Hospital, is a type of book which we should like to see more of. It is a concise and accurate account of the brain of a macrosmatic mammal compared with that of the human brain; and since the olfactory part of the brain and the floccular and parafloccular regions of the cerebellum are specially well developed in the sheep, their study in the sheep's brain should prove a valuable help in obtaining a clear conception of these parts in the human brain, in which they are only feebly developed. By a comparison of the degree of development of such parts as are known or are believed to be associated with particular functions, the knowledge obtained by experimental evidence of localization of function may be very materially assisted, and we confidently recommend the book to all who are interested in the comparative anatomy and functions of the brain. It is published by Humphrey Milford, Oxford University Press, at 6s.

The fact that a second edition of Dr. CYRIL BURT's book on *The Subnormal Mind* has been called for little more than two years after the publication of the original edition is perhaps the best testimony to its value and practical usefulness. The interval has indeed been so short that very little change in the text has been necessary. Beyond a general revision the only difference between the editions is that there has now been added an appendix giving a useful list of stimulus-words for the free association test. In the *Journal* of September 28, 1935, there was a review of the first edition. We may remind our readers that we then assessed its merits and value highly, and that it dealt with its subject very fully and in a manner which is directed towards its use in practice by both the doctor and the teacher, as well as constituting it an excellent textbook for students in both professions. Its successive chapters deal with the normal mind, the mentally deficient, the dull or backward, the delinquent, the neurotic, sthenic neuroses, sthenic neuroses, and ascertainment and incidence. Although this new edition (Oxford University Press, 10s. 6d.) contains a few pages more than the original, it is of similar make-up and slightly smaller in handling.

We have received the fifth edition of Dr. OLIVER S. ORMSBY's well-known *Practical Treatise on Diseases of the Skin* (Kimpton, 52s. 6d.). It is a substantial and com-

prehensive work, and the author, who is assisted by Dr. C. W. Finnerud on the pathological side, has done his best to prevent the book from growing into too unwieldy dimensions with its successive editions. It is well illustrated, mostly from good photographs, but the three coloured plates hardly come up to the general standard of excellence maintained by Dr. Ormsby.

The Essentials of Pharmacology. Materia Medica and Therapeutics for Medical Students, by Dr. D. M. MACDONALD, is a pocket volume of 280 pages (Kimpton, 7s. 6d.). Special attention is paid to the description of the characters of drugs and the forms in which they can be prescribed. The book opens with brief but valuable notes on prescribing, incompatibility, channels of administration, poisons law, etc.

A new American *Handbook of Orthopaedic Surgery*, by Dr. A. R. SHANDS, jun. (Kimpton, 21s.), has the merit of not being too long, and the information is reasonably up to date, although an American bias is unmistakable. Illustrations are an important part in a book on orthopaedics, and it is therefore surprising to find that each one is a drawing or diagram, even the radiographs. It is difficult to see why the last should not be properly reproduced as photographs. The whole effect is very nineteenth-century. The author has succumbed to the attractions of the rare disease when he could ill afford the space. He gives a page to fungus infections of bone, but has little to say about the treatment of active rickets: "The treatment of its active stage is of a pediatric nature." This is carrying specialization too far. The book also suffers in that principles of treatment are either neglected or submerged in a mass of detail.

Preparations and Appliances

MAGNIFIER FOR SMALL OPERATIONS

Dr. F. OLIVER WALKER (Dartford, Kent) writes:

I have often felt the need of a powerful magnifier which could be used for the removal of foreign bodies from the eye. I had tried a watchmaker's eyeglass. This was not entirely satisfactory owing to the difficulty of holding it in the orbit and

because of steaming of the lens. I consulted Messrs. Clement Clarke, Ltd., of 16, Wigmore Street, W.1, and suggested to them that they might make me a spectacle to my own correction and a 14OD lens, this lens to be fitted on a swinging arm in front of one eye, in my case the left, because the left is my master eye. There is a spring clip which keeps the lens out of the way when not required.

I find the device excellent in every way, since it leaves my hands free for the removal of a foreign body or for the purpose of other minute operations. Such a device might also be useful to dermatologists or to biologists for minute dissections. In fact its uses could be endless. I would suggest that it would be useful to watchmakers, jewellers, and others. The spectacle is comfortable in wear and the lens is in a well-balanced position. I am grateful to Messrs. Clement Clarke for their co-operation and help in producing the spectacle.

generally held in this country. He describes the neurasthenic as an introverted personality who is strongly motivated. That person's feelings and emotions are very intense, and he takes himself very seriously. He tends to react by compensation because he is too inclined to yield to the influence of the other person, and this may lead to negativism. He introspects endlessly in a search for the causes of his difficulties, and he rationalizes in order to keep himself from seeing that he is striving to retain and aggravate his own symptoms.

Psychopathics and epileptics are discussed as constituting a border-line between psychoneuroses and psychoses; and then follows a survey of the functional psychoses under the headings of manic-depressive psychoses; involution melancholia; paranoia and paranoid conditions; and schizophrenia or dementia praecox. Next general paresis, and alcoholic, drug, and senile psychoses are described as the commoner organic psychoses. Three chapters on sleeping, dreaming, and suggestion and hypnosis are inserted at the end of the section, partly because these reactions are important for the life of the individual and have an interest in themselves, and partly because they provide the student with a means of gaining considerable insight into the nature of mental organization and personality in general and, when carefully studied in relation to a specific individual, of arriving at a better understanding of that individual's particular personality or mental make-up. A chapter is also devoted to the feeble-minded individual, and there is a "last word on mental hygiene."

This is a well-thought-out and well-presented book, certainly worthy of the close attention of all those interested in psychopathology and psychotherapy.

MELLOR'S CHEMISTRY

A Comprehensive Treatise on Inorganic and Theoretical Chemistry. Volume xvi. By J. W. Mellor, D.Sc., F.R.S. (Pp. 811; 94 diagrams. 63s. net.) London, New York, Toronto: Longmans, Green and Co. 1937.

Mellor's *Chemistry* is now complete with the issue of the sixteenth volume. This volume deals with the metal platinum, and contains the general index. The preceding volumes have been described in this *Journal* as they appeared serially, and little can be said of the final volume that has not been said before. The present is, however, a fitting occasion for a recapitulation of the main features of the treatise. It is the most comprehensive work on inorganic chemistry that has yet been seen. The word "comprehensive" is not here lightly used. Information of every kind and of the most recondite nature is arranged and co-ordinated in a form that renders easy the search for knowledge of facts; and not only the knowledge of finally verified facts but the observations made in the experimental efforts of workers who only partially succeeded in their object. The treatise is all-embracing. A map illustrating the geographical distribution of platinum, a history of the scanty esteem it once enjoyed, statistics of its economic employment, a diagram showing its fluctuating price—all these are given in detail sufficient to satisfy every kind of inquirer. But all this wealth of detail belonging to the fringe of pure chemistry is insignificant by comparison with that concerning chemistry proper. Every kind of chemical reaction that has been recorded in literature is here set down in an arrangement connecting it with related or kindred reactions. The cost of the work involved in producing this arrangement is beyond estimate, as is also the extraordinary gift of ordered knowledge and power of grasp which were necessary to effect it. The bibliographical

references are so exhaustive that it is difficult to believe that anything relating to inorganic chemistry has been omitted.

The work will long remain monumental in the world's chemical literature. The most exacting criterion of excellence is reached when a reader puts down a book with a new feeling of ignorance after perusing a subject that he thought he knew well. It is safe to say that, no matter in whose hands, this book may be judged by that standard and will pass the test.

DISEASES OF VULVA, VAGINA, AND CERVIX IN PREGNANCY

Maladies des Femmes Enceintes. IV. Affections des Muqueuses Génitales. By Henri Vignes. (Pp. 126; 2 figures. 24 fr.) Paris: Masson et Cie. 1937.

This volume is the fourth in the well-known series on the disorders of pregnancy edited by Vignes, and is devoted to diseases of the vulva, vagina, and cervix. It might be suggested that such a work is superfluous, for there is hardly any gynaecological condition which is not affected by pregnancy. But though every obstetrician is naturally familiar with the diseases described, their presentation in relation to the particular changes involved by pregnancy cannot but be of value in spite of a good deal of inevitable redundancy. All the usual, and most of the rare, conditions are described in detail, but the main interest naturally lies in the therapeutic aspect. In this connexion it may be noted that the general lines of treatment suggested are mainly similar to those adopted in this country. Of particular interest is the discussion on carcinoma of the cervix, for the combination of malignancy and pregnancy is always a difficult problem, particularly when the growth is discovered about the twenty-eighth week. There has been much discussion, mainly in Belgium, as to whether it is justifiable in such a case to delay treatment until the child is safely viable, and it is the practice of some surgeons to leave the decision to the patient and her relatives. But the accelerated growth of carcinoma during pregnancy may change an operable tumour into a hopeless one within the course of a few weeks, while the sedative benefits of radium should not be withheld from an advanced case, for the patient will not in any eventuality survive parturition very long, and must also be subjected to the added strain of Caesarean section later on.

The work is well indexed, copiously annotated, and written with the author's characteristic fluency and style, and, though undistinguished by any striking innovation or originality, it is a most useful summary of a number of not uncommon combinations.

HANDBOOK OF TUBERCULOSIS FOR NURSES

A Manual of Tuberculosis for Nurses and Public Health Workers. By E. Ashworth Underwood, M.A., B.Sc., M.D., D.P.H. With an Introduction by Professor J. R. Currie, M.D., F.R.C.P.Ed., D.P.H. Second edition, revised and enlarged. (Pp. 404; 58 figures, 6 tables. 8s. 6d. net, postage 6d.) Edinburgh: E. and S. Livingstone. 1937.

Nurses occupy somewhat an anomalous position in connexion with the teaching of medicine, and the task of preparing a really satisfactory textbook for them is by no means simple. Dr. Underwood has gone a long way towards accomplishing such a task successfully in regard to tuberculosis. We welcome the publication of this second edition of his excellent little book, the scope of which has been appreciably widened in order that it should appeal not only to the probationer preparing for

the pain was experienced. Sir Thomas emphasizes the importance of assessing the quality of the pain. The common descriptive terms such as "tearing," "boring," "cutting," or "stabbing" are of little value. Clear-cut evidence is presented that three kinds of somatic pain exist, coming respectively from skin, muscle, and tendon, and differing qualitatively in their characteristics. Skin pain is always of the same quality, whether it is produced by pricking, burning, passage of an electrical current, or the application of irritant poisons. The short painful stimulus produced in any of these ways gives rise to a sensation best known as "pricking." More prolonged stimulation of the skin sets up a "burning" pain, whether it is due to heat or not. No additional term need be introduced to describe the pain which is the after-effect of injuries such as continued friction or ultra-violet burns, as it has no distinctive qualitative characteristics. Examination of the muscles shows that they can be the seat of a distinctive pain which is disagreeable, continuous, possibly wavering a little in intensity, diffuse, and difficult to locate; though indescribable, it is quite different from skin pain. It can be produced by such varying procedures as exercising a muscle under ischaemic conditions,^c squeezing the muscle violently, or injecting into it hypertonic or acid isotonic saline solutions. A point of clinical interest is that muscle pain may often be referred to distant parts. The third kind of pain recognized by Sir Thomas Lewis he calls "web" pain, because it is easily elicited by squeezing the short web of skin between adjacent fingers; but pain indistinguishable qualitatively can be elicited by appropriate stimulation of tendon or periosteum. Sir Thomas suggests that the most satisfactory way of detecting objectively the quality of a pain felt by a patient is to reproduce each of the three kinds of pain already described, preferably during an attack of spontaneous pain, and to ask the patient to judge whether any one of them is identical with the pain which he is experiencing. In this way, in an observant and co-operative subject, evidence as to site of spontaneous pain can probably be obtained. This method may be of special value in the differentiation of the different forms of headache; during quiescent periods pain could be experimentally induced from the muscles or aponeuroses attached to the occiput to see whether it resembles or differs from that of which the patient ordinarily complains. Such studies can be extended by attempting to reproduce the pain, not only as regards quality and distribution but also as regards intensity and the circumstances in which it naturally arises. This is well shown in the experimental

reproduction of the muscle pain of intermittent claudication or the skin pain of erythromelalgia by appropriate means.

Many additional questions will occur to every reader once the subject has been clarified so far, and they will doubtless be answered by future research. Is, for example, the referred somatic pain of visceral disease distinctive in quality or is it identical with one of the three types recognized by Sir Thomas Lewis? If the latter is found to be the case interesting conclusions follow. It has already been pointed out that the quality of pain, as of all sensations, depends on the region of the sensorium activated. If visceral referred pain proves to be identical with some form of somatic pain it would mean that visceral afferent impulses can irradiate widely in the brain to reach the cerebral areas normally concerned with the recognition of pain of somatic origin. Again, is the "protopathic" pain which is felt during recovery from nerve lesions a distinctive entity, and what is the quality of so-called central pain? Posing these questions will probably lead to their satisfactory elucidation. But theoretical considerations aside, Dr. J. H. Kellgren's paper on page 325 of this issue shows that immediate practical results may follow rapidly on a seemingly academic inquiry. He finds that in painful muscular states usually called "myalgia" or "fibrositis" localized areas can be found which are tender to palpation; if pressed upon a diffuse widespread pain is set up similar to that from which the patient suffers during his attacks. Evidence is presented that this more generalized pain is probably of the referred type. When the tender spots are infiltrated with a local anaesthetic both the localized and the referred pain disappear, sometimes for periods as long as one to four weeks. Dr. Kellgren's fuller account will be eagerly awaited, but enough clinical details are given to indicate the probable value of this form of treatment; it certainly offers scope for useful work on the part of the general practitioner. It is clear also that other forms of local therapy such as heat and massage or radiation might be more usefully applied to the local tender spots which are probably the actual foci of disease rather than to the wider area of referred pain or disability.

LONDON WATER IN 1936

The high standard of purity which is justly claimed for the water supplied by the Metropolitan Water Board to the London area has been achieved as a result of the efficient operation of an imposing and well-devised system of reservoirs, wells, filters, and other purification plant. The whole structure

PAIN AND DISEASE

Physiological investigations during the last decade, particularly those of Professor E. D. Adrian¹ in this country, have much clarified our ideas of the mode of action of the sensory organs, especially those in skin and muscle. There is still uncertainty about the exact anatomical identity of the nerve-endings in the skin which subserve pain, touch, and temperature, but there is little doubt that there is in each case a specific type of nerve-ending which responds to the appropriate stimulus and to none other. Similarly, the muscle spindles and tendon organs respond specifically to changes in tension produced by stretch or by active muscular contraction. Little, however, is known about the nerve-endings responsible for pain sensitivity in muscle, though there is no doubt that various experimental procedures and disease conditions may set up pain in these structures. The *quality* of a sensation depends on the properties (largely not understood) of the region of the brain in which the impulses from the sense-organ end. To take a well-known example: activation of the appropriate region of the occipital cortex gives rise to the sensation of sight whether it is brought about by light falling upon the eye, artificial stimulation of the optic nerve trunk, or irritation of the cortex itself. The *intensity* of the sensation depends on the frequency of the impulses set up in the peripheral sense-organ, and this may vary from a few to several hundred per second. The *extent* of the area stimulated is judged from the number of afferent fibres simultaneously activated, and this in turn is related to the number of nerve-endings which are discharging. Less is known about the way in which sensation is localized, but probably this depends on the anatomical connexion of points in the peripheral sensory field with special groups of cells in the sensorium. The sensation of pain is of special interest both to doctor and to patient, if only for the reason that it is so often responsible for bringing them together. It is quite clear that pain must be regarded as a specific sensation, and not as a mere intensification of other sensations. Our knowledge of visceral sensation is more fragmentary. Normal afferent impulses from viscera do not reach consciousness but expend themselves in producing various reflex modifications of visceral or somatic activity. The extent and importance of the changes that they can set

up are ably dealt with in a recent monograph by Schweitzer.² Thus, stimulation of the central end of the vagus,³ distension of the urinary bladder, or gentle handling of the small intestine may diminish muscle tone and abolish the knee-jerk. Similarly, increasing the pressure in the carotid sinuses not only reflexly affects circulation and respiration but also may modify skeletal muscle tone and induce a condition indistinguishable from normal sleep. In exceptional circumstances stimulation of the viscera may give rise to pain which may be vaguely localized or referred to distant parts. In the case of the gut the appropriate stimulus is usually a change of tension in the muscle coat; in the case of the heart it results from the action of chemical substances liberated during ischaemia. The important researches of Morley⁴ and Capps⁵ have proved the reality of referred pain, particularly from the parietal pleura and peritoneum. Thus stimulation of the central part of the diaphragmatic pleura gives rise to pain which is referred to the neck and shoulder; this is attributed to the fact that both regions are supplied by the same segments of the cervical cord. Similarly, stimulation of the peripheral part of the diaphragm, which is supplied by the lower thoracic nerves, gives rise to pain which is referred to the somatic distribution of these nerves in the skin and muscles of the abdominal wall and back.

An important advance in our understanding of somatic pain is made in Sir Thomas Lewis's interesting paper in this issue on page 321. Using the simplest of experimental methods with characteristic skill and elegance, he has reclassified somatic pain and described methods of investigating it in patients. A complete description of pain should "comprise a statement of severity, of kind or quality, of relation to time, and of the locality and the circumstances in which it is felt." "Severity" is briefly dismissed because it is thought to be too dependent on the mental and emotional make-up of the patient to be gauged with any accuracy. Stress is laid on the duration, and more especially on the time-intensity curve, of pain for diagnostic purposes. The pain of angina pectoris, for example, rises to a plateau and lasts for a long time with little fluctuation before diminishing and vanishing; on the other hand, inflammation of the dental pulp causes pain which is felt in rhythmic pulses. Localization of the site of pain is of the greatest importance, but becomes difficult when one deals with the deeper visceral and somatic structures. Detailed information on this point is not readily elicited when much time has elapsed since

cation will be followed with much interest. Further point is given to these researches by the recent statistical inquiry into menstrual periodicity carried out by Gunn, Jenkin, and Gunn.⁴ As the result of a detailed investigation into the menstrual histories of nearly 1,000 women these workers concluded that the variation is so considerable that it is impossible to specify a menstrual "type," in the sense of a regular interval. While this statement may appear rather sweeping, there is no doubt that it is true enough to emphasize the inaccuracy of the Ogino-Knaus calculations and to add point to the value of alternative methods.

RESULTS OF SANATORIUM TREATMENT

It is now generally recognized that the remote results of "sanatorium treatment" are far from satisfactory, and there is a tendency to throw all the blame for this on inadequate "after-care." The actual methods of treatment carried out in the sanatoria are rarely questioned. That more attention needs to be paid to these is impressed upon us by reading, in his annual report for 1936, the results obtained by Dr. Peter W. Edwards at the Cheshire Joint Sanatorium. Of 331 patients, no fewer than 210 (65 per cent.) stayed over six months. Artificial pneumothorax was given to 199 patients, phrenic evulsion was carried out in 91 and adhesion-section in 108; gold salts were administered to 125 patients. The immediate results, as judged by the finding of tubercle bacilli in the sputum, are particularly striking in view of the fact that in this institution concentration and culture methods are routine procedures when bacilli are not found by direct examination: 65 per cent. of the patients admitted had tubercle bacilli in the sputum, which were present in only 23 per cent. of those discharged. A negative sputum examination was obtained finally in all those classified as T.B. + 1, in 70 per cent. classified as T.B. + 2, and in 52 per cent. classified as T.B. + 3. Dr. Edwards gives the ultimate results in 3,452 patients for a period covering one to twelve years after discharge from the sanatorium, with particular reference to those treated by artificial pneumothorax and by phrenic evulsion. The amazingly small number of fifty-seven (1.65 per cent.) were untraced. The percentages of patients still alive in March, 1937, in the groups T.B. -, T.B. + 1, T.B. + 2, and T.B. + 3 were 80, 84, 61, and 21 respectively. Of the patients selected for artificial pneumothorax from 1924 to 1932 in whom phrenic evulsion was also carried out 83 per cent. were alive four years later when the collapse was complete; 60 per cent. when it was partial; and 46 per cent. when the induction failed. The respective percentages in similar groups when phrenic evulsion was not done were 62, 22, and 25. The results of artificial pneumothorax induced between 1924 and 1934 with and without phrenic evulsion, "according to choice," and according to the Ministry of Health classification, as judged by survival to March, 1937, are also indicated in tables. These results, both immediate and remote, as set out in the report are much superior to those usually published from other institutions, and speak greatly in favour of artificial pneumothorax and of phrenic evulsion. The

claims made at the Cheshire Joint Sanatorium therefore appear to deserve careful statistical examination by an independent authority. If confirmed, the findings of Dr. Edwards should show the way to improving the results of sanatorium treatment by directing attention to methods of treatment in institutions as well as to after-care. In one other respect the report is outstanding—in the amount of pathological work carried out in the well-equipped pathological laboratories. It emphasizes the indispensability of such a department in every institution for the treatment of tuberculous persons.

LAURA BRIDGMAN

The Perkins Institution for the Blind in Watertown, Massachusetts, recently celebrated an interesting centenary. In 1837 the first blind deaf-mute to be taught the use of language was admitted to this pioneer school. As an infant Laura Bridgman had suffered severely from fits. In her twenty-fourth month she had an attack of scarlet fever, which destroyed both sight and hearing and almost completely abolished smell and taste. At the age of 8 this triply handicapped child attracted the attention of Samuel Gridley Howe, first director of the school, who succeeded in penetrating her darkness and helped her to adjust herself to life through the sense of touch. She learnt to sew, and her embroidery was so beautiful that she became a teacher of sewing in the institution. She was kept alert and happily occupied until her death at the age of 60 in 1889. Her story, which Dickens tells in his *American Notes*, is pleasantly related in the December number of the *Scientific Monthly* (1937, 45, 573). Its scientific aspects were discussed by Professor Frederick Tilney in a paper entitled "A Comparative Sensory Analysis of Helen Keller and Laura Bridgman," which was published in *Archives of Neurology and Psychiatry* (1929, 21, 1227).

A special lecture on "Some Recent Work in Experimental Cancer Research" will be given by Dr. W. E. Gye, Director of the Imperial Cancer Research Fund, at the Royal College of Surgeons, Lincoln's Inn Fields, W.C., on Wednesday, February 16, at 5 p.m.

We regret to announce the death of Sir Josiah Court at the great age of 97. He qualified M.R.C.S. in 1863, and will long be remembered for his investigations into the aetiology and incidence of miners' nystagmus.

An address entitled "The Doctor in the Home" will be given to senior students of the twelve medical schools in London and to those who have qualified in the last two years by Sir Kaye Le Fleming, M.D., Chairman of Council of the British Medical Association, on Tuesday, March 8, at 5.30 p.m., in the Great Hall of B.M.A. House, Tavistock Square, W.C. Tea in the Members' Lounge from 5 to 5.25 p.m. A film illustrating the work of the Association will be exhibited at 5.15 p.m., and after the address there will be a "talkie" film dealing with physical fitness education, a subject to which Sir Kaye will allude. Fourth- and fifth-year students who do not receive a card of invitation by February 27 should seek one from their Dean, or from the Honorary Secretary of the Metropolitan Counties Branch at B.M.A. House.

⁴ *J. Obstet. Gynaec. Brit. Emp.*, 1937, 44, 839.

with practice does occur; but all workers are agreed that it is slight and quite insufficient to account for the remarkable improvement which follows vitamin A therapy. A close relation has repeatedly been found between the incidence of night blindness and the previous diet of groups of individuals. Jehgers,¹ for example, studied the dietary history of university students who had been placed by the dark-adaptation test into two groups—normal and subnormal. The diets of the normal group were calculated to contain an average of 5,560 international units of vitamin A, with a range from 3,300 to 9,000 units. The subnormal group averaged 2,445 international units, with a range from 900 to 4,000. Maitra and Harris² found that of 200 elementary school children in London and Cambridge from 22 per cent. to 36 per cent. were in the "definitely subnormal" category, whereas at a public school examined at the same time none of the boys was definitely subnormal. Mutch and Griffith,³ examining university students, mill girls, industrial school boys, and children of working-class parents, found that only the university students failed to improve after a single large dose of vitamin A. We do not yet know what is an adequate intake of vitamin A, but there can be little doubt that a significant improvement in dark vision after a single large dose of vitamin A is presumptive evidence that the vitamin A content of the patient's diet was previously inadequate. When the improvement is observed in groups of people low in the economic scale and not among people who are better off the evidence becomes less presumptive. As Mutch and Griffith point out, the important dietary sources of vitamin A—milk, butter, eggs, liver, carrots, and green vegetables—are relatively expensive food-stuffs, and deficiency will therefore be commoner among poor people. There seems little doubt that the objective testing of dark vision will almost always detect minor deficiency before any other clinical signs are present, and it is to be hoped that in the future most hospitals and clinics will be in the position to conduct it.

INDUSTRIAL WELFARE THE WORLD OVER

The annual report of the Industrial Welfare Society for the year ended June 30, 1937, states that the society has maintained and increased its foreign and colonial contacts. The director, the Rev. Robert Hyde, after spending some weeks in Sweden, meeting leading Swedish industrialists and visiting factories in several towns, found that much could be learned from this extremely prosperous country, and that the encouragement of close friendships would be to the mutual advantage of the two nations. Many oversea visitors have consulted the society, seeking information on problems concerning health, co-operation, accident prevention, and security in industry. Among these were three Japanese doctors, and representatives of social organizations and research students from Belgium, Finland, Hungary, Turkey, Palestine, and many other countries. The council feel that close links may thus be forged between ourselves and other nations, which will make for better

international understanding. With regard to health in industry the report pays a tribute to the medical services of individual firms. Although the toll of occupational diseases has decreased, the efficiency and happiness of the individual worker is still too often impaired by fatigue and vague ill-health. The works doctor, with his special knowledge of the employees and the processes on which they are engaged, is in a position to carry out valuable preventive work.

THE TIME OF OVULATION

The recent work of Ogino¹ and Knaus² on the control of conception by the limitation of coitus to the so-called "safe" period has stimulated a good deal of research into the question of the exact time of ovulation, for it is upon this that the necessary calculations are based. The determination is usually done on the assumption that ovulation occurs around the fourteenth day after menstruation, with variations according to the individual type of cycle. This assumption is based on operative findings, on observation of patients in whom rupture of the follicle is accompanied by painful symptoms (intermenstrual dysmenorrhoea), and on direct palpation of the growing follicle (Dickenson).³ There is, however, so much individual variation that Knaus's method, with its guesswork calculation, cannot attain sufficient scientific accuracy to enable the ovulation time to be determined with any real degree of exactitude, and it is for this purpose that Rock, Reboul, and Wiggers⁴ have elaborated their electropotential technique. This is based on the previous work in animals of Burr, Hill, and Allen,⁵ who were able to demonstrate that a difference of potential arose with ovulation in the rabbit and that this electrical disturbance could be measured by means of a vacuum-tube potentiometer. In the human being the difference is recorded by the projection of a reflected beam from a moving-cell galvanometer connected with specially constructed vaginal and abdominal electrodes, and in the case reported quite definite results were obtained. A sudden sharp change in potential, lasting about an hour, was coincident with ovulation (as verified by subsequent laparotomy), the difference from normal attaining the very considerable amount of 7 millivolts. This has since been verified in a later case, and it does appear that the technique described provides a more accurate index of the time of ovulation than has hitherto been available. Whether this is clinically important, and whether the discomfort and tediousness of the method are justified by its somewhat theoretical value, is doubtful, and it is more than possible that the electrical changes found are due to the exaggerated tubal contractions which follow ovulation rather than to that function itself. But the demonstration that these cyclic phenomena can be recorded with such accuracy is a valuable discovery, and its further appli-

septic finger, if it is associated with any constitutional symptoms, rest in bed is most important. In treating a leg the patient is kept in bed and the limb is elevated on pillows: if the foot or ankle is concerned a splint holding the ankle at a right angle is called for. It is sometimes quite surprising how cellulitis will cease to spread and the temperature drop as soon as all movement of the affected part is prevented.

There are a number of different ways in which heat may be applied: moist heat in a bath, dry radiant heat, and various forms of fomentations. For a severe cellulitis of the finger or hand the following is an outline of the treatment and the method of applying heat. The patient should be kept strictly in bed from the beginning. Every two hours the hand is immersed in an arm bath of hypertonic saline (5 per cent.) for half an hour, the water being kept at as high a temperature as the patient can tolerate; it is then lifted from the bath, not rubbed but very gently dried by swabbing with wool, placed on a pillow, and given an application of radiant heat. Radiant heat is easily provided by placing the hand under a leg cradle to the top of which an ordinary electric-light bulb is tied. The cradle is then covered with a mackintosh and blanket. Care must be taken not to have the electric bulb too close either to the hand or to the mackintosh, as either may very easily be burned, and the strength of the lamp should not be more than 25 or 40 watts. As the hand is lifted out of the bath and rested on the pillow the fingers and wrist should be kept quite still, and if the patient is inclined to move the hand about when it is on the pillow it should be gently secured to a splint but with the inflamed part left exposed to the heat.

When the leg is concerned it is not always convenient to soak the part in a bath, and the following treatment may be carried out. The whole area involved in the cellulitis is covered with magnesium sulphate paste, which is warmed to body temperature and spread on gauze so as to make it easy to apply. Over the gauze is placed hot antiphlogistine spread on lint, and the whole leg is then wrapped in cotton-wool. The dressing may be changed every twelve or twenty-four hours, when any spread of the cellulitis is noted. Both in the case of the arm and that of the leg it is essential that treatment should not be allowed to interfere with sleep, and the hot baths should be given to the arm only when the patient is awake. The patient should take large quantities of fluid and as much food as he can eat. With a cellulitis there is often great pain, especially when the finger is affected, and this, unless relieved, will do great harm by preventing sleep and thus lowering the patient's resistance. If the pain is bad morphine or dilaudid should be given.

WHEN TO INCISE

There is often a temptation to make early incisions, especially when the area of inflammation is spreading and the temperature is raised; but there is nothing to be gained by incising a cellulitis in the initial stages. It is far better to pursue conservative treatment, for it will be found that many cases of cellulitis will recover without the necessity of making an incision, and thus the convalescence is shortened. But this is not the sole reason for avoiding operation. It is believed, and has been proved, that far from doing good early incisions are likely to do harm. In the first day or two of the inflammation the surrounding tissues are building up barriers of defence, which, if called upon to withstand the added trauma of an incision, are likely to break down and allow

the infection to spread further. The only real indication for incising a cellulitis is suppuration, and as soon as pus has formed it should be let out. At this stage the infection has usually become limited, and only good comes from making an incision, provided the latter is confined to the area of the abscess and does not encroach on the surrounding tissues. After the incisions have been made hot arm baths should be continued, but with normal saline at first and then with a gradually increasing strength of salt solution. Care should be taken not to let the part get too sodden, and ten or fifteen minutes' immersion every three hours may be long enough. In the interval between the baths the hand should be covered with gauze and lightly bandaged or wrapped in a sterile towel and given radiant heat for about an hour. After this it should be allowed to lie at rest on a pillow or in an elevated position.

It is sometimes argued that before pus has formed incisions should be made to lower the tension in the tissues, so as to relieve the pain and because the tension is thought to do harm to the tissues. It is far better to diminish the swelling by elevating the limb and giving drugs for the pain. A leg may be supported on pillows or slung from a cradle. The arm is easily held in an elevated position by a roller towel, the upper end of which is suspended from the ceiling or wall, while the arm rests in the lower end, preferably with the elbow flexed and the hand pointing upwards.

Contractures are likely to follow cellulitis overlying a joint—a result all the more to be expected when incisions have been made. This possibility must always be kept in mind, and should be prevented by suitable posture or splints. When cellulitis is severe and of streptococcal origin sulphanilamide may be used as described in the treatment of erysipelas, the same precautions of course being observed.

The above account of the treatment of cellulitis is applicable to that condition in general; there are, however, many important points of difference in the treatment of various parts of the body, but it is not possible to describe all of them here. Nevertheless, reference must be made to one most important point concerning the time for incisions in certain situations. In most parts of the body it is inadvisable to make early incisions in cellulitis, but in the neck it is different. A diffuse cellulitis in this region is quickly followed by oedema of the larynx and pharynx, which, combined with the great tension in the neck, causes suffocation. Incisions must be made early, but if these are only through the skin and subcutaneous tissues they are of no value: the deep fascia must be incised, for in all cases of serious pressure there is tense oedema beneath it. Similarly, when cellulitis affects the orbit or scalp incisions should be made before serious damage is done to the eye or before the blood supply to the outer table of the skull is imperilled.

Lymphangitis

The typical red streaks extending up a limb, indicative of lymphangitis, give some idea of the severity and seriousness of the infection, particularly as regards spread and degree of toxæmia. They are more commonly seen with streptococcal than with staphylococcal lesions, and as a rule begin to fade at the end of thirty-six or forty-eight hours. Lymphangitis of itself requires no treatment, but a careful watch must be kept on the lymphatic glands into which the vessels drain. With the fading of the red streaks these glands, which will have been tender and slightly enlarged, will usually become less tender. But occasionally, instead of resolving, the gland may

SURGICAL PROCEDURES IN GENERAL PRACTICE

This is one of a series of articles contributed by invitation

ERYSIPELAS AND CELLULITIS

BY

JOHN HOSFORD, M.S., F.R.C.S.

Erysipelas is an inflammation due to a streptococcal infection in the lymphatics of the skin. It is most characteristically seen on the face, and more often than not there is no obvious origin of the infection. In other cases, both on the face and elsewhere in the body, erysipelas starts either from a punctured wound or minute crack, or from an open infected wound. Its characteristic red appearance, with a well-defined slightly raised edge and minute vesicles, is unmistakable. The usual acute form is associated with marked constitutional symptoms and a high temperature. There is also a less acute type in which the pyrexia is of low degree and the patient not gravely ill: this form is sometimes recurrent at several weeks' interval.

Like that of other acute infective conditions which the surgeon meets with, the treatment of erysipelas is both local and general; but erysipelas is unlike most of the others in that the general treatment is of very great value and more important than the local. In the past many drugs, mostly of the type of antiseptics given intravenously, have been tried, but without benefit. Streptococcal sera and vaccines, sensitized and otherwise, have been used, though never with any convincing success.

Since the introduction of sulphanilamide as a remedy in streptococcal infections, however, we have a drug of the utmost value in the general treatment of erysipelas. In fact, erysipelas is one of the conditions in which sulphanilamide has had its greatest success. Its full name is para-aminobenzenesulphonamide, but it is put up by various firms, usually in 7½-grain tablets, under such names as sulphonamide-P, streptocide, prontosil album, and sulfanilamide. It is a white crystalline solid, and is given in tablet form by mouth. In order to maintain its concentration in the blood stream it is better, in the acute stage, to spread it over the day. It may be given four-hourly, one tablet at a time, with two night and morning, making a total of eight tablets, equal to 60 grains, for the whole day. The above dose, which is the average for a man of 10 st., should be adjusted to the size of the patient, and may be exceeded for a few days. When giving sulphanilamide certain precautions should be taken to prevent the complication of sulphaemoglobinaemia, which is caused by absorption of hydrogen sulphide produced in the colon. This condition is easily recognized, as the patient becomes cyanosed. To prevent its onset no purgatives must be given and the patient should be placed on a high-calorie low-residue diet and take liquid paraffin night and morning. Amidopyrine (contained in allonal) is forbidden, and phenacetin should be avoided if possible. Sulphanilamide may be prescribed at any stage of erysipelas, but of course the sooner it is given the sooner will it cut short the attack. In most cases it has a profound, sometimes dramatic, effect: the temperature drops to normal in forty-eight hours or less, the rash fades, and the patient feels better. During this period he must of course be kept in bed. In some cases in which, following the administration of sulphanilamide, the temperature has quickly dropped and the local condition improved, a relapse has occurred when the drug has been immediately stopped. It is advisable to continue

giving the drug, though in slightly smaller doses, for four days after the temperature has been normal. Agranulocytosis, which is a rare complication of prolonged sulphanilamide treatment, is most unlikely to come on after such a short course of treatment, but particular care should be taken with feeble or anaemic patients. Pain is not usually severe, but if it is morphine or its derivatives should be given, as rest and sleep are essential. Increased quantities of fluids should be taken, but, as already mentioned, purgatives must be forbidden.

So many lotions and ointments have been tried as local applications for erysipelas and given up that clearly none of them is of real value. Ichthyol has been very widely used, but its benefit is doubtful, though its smell, colour, and associated mess are impressive. When the inflamed area feels hot and painful relief may be given by applying gauze soaked in lotio plumbi. To prevent the spread of erysipelas it has been recommended that the healthy skin just beyond the red advancing edge should be painted with a strong iodine solution or even scarified in order to excite a protective leucocytosis and so render the tissues the better able to destroy the advancing streptococci. The infrequency with which these methods are used is the best testimony to their value.

Incisions should not be made in areas of erysipelas either with the idea of preventing its spread or under the mistaken idea that there is pus to let out. The only indication for incisions in erysipelas is extreme oedema such as may occur in the loose cellular tissues of the eyelids or scrotum. Small punctures may be made with a knife to allow the escape of fluid, but as the oedema subsides rapidly as soon as the inflammation begins to diminish this treatment is very rarely called for.

Many methods of treatment, both local and general, have been used for erysipelas, which remains an infection with a low mortality rate, and if left untreated will run its own course and disappear, leaving no ill effects. The treatment outlined above, however, is planned to shorten the course of the disease and add to the comfort of the patient.

Cellulitis

By cellulitis is meant an infective inflammation of the subcutaneous tissues, usually superficial to the deep fascia, though sometimes beneath it. Whereas erysipelas is always a streptococcal infection, cellulitis may be either streptococcal or staphylococcal, and is occasionally due to other organisms. There are several routes by which organisms may gain access to the tissues, but it is most commonly by infection carried in through a punctured wound. The infection may extend rapidly in the cellular tissues and, especially in streptococcal cases, there is likely to be a lymphangitis and lymphadenitis as the result of quick spread by the lymphatics. The treatment of lymphangitis is so much that of the initial cellulitis that they will be considered together.

The treatment of cellulitis is the classical treatment of an inflammatory condition, and may be summarized in absolute rest, heat, and adequate incisions when pus has formed. The first item—rest—is often overlooked, but it is of the greatest importance. When a finger or hand is infected it is essential to splint the part and rest the whole arm, either in a sling or, if the patient is in bed, on a pillow; and it may be added that in the case of a

Nova et Vetera

SIR HANS SLOANE

Professor W. W. D. Thomson recently delivered a presidential address before the Ulster Medical Society. He took as his subject "Some Aspects of the Life and Times of Sir Hans Sloane," and the text appears in the January number of the *Ulster Medical Journal*. In this address he gives many facts about the great Ulsterman which are but little known. Sloane was of Scottish extraction and his father settled in County Down at the time of the plantation by King James I. He was receiver-general of taxes and was a man of considerable importance. His immediate neighbour was James Hamilton, second Viscount Claneboye and first Earl of Clanbrassil, whose wife brought with her Sarah Hickes to act as companion. Sarah was the daughter of a prebend, said to be of Winchester, who had acted as chaplain to Archbishop Laud, and of this prebend it should be possible to get further details. She married Alexander Sloane, and Hans, their seventh son, was born on April 16, 1660. Hans being a name already known in the Claneboye connexion.

The boy soon showed an interest in science and botany, determining to become a doctor. His father being long dead, he was sent to live with a chemist in Water Lane, Blackfriars, close to the Society of Apothecaries. Here he soon came under the influence of his fellow-countryman, Robert Boyle. In London he haunted the newly founded Physic Garden at Chelsea, becoming the pupil and life-long friend of John Ray, the greatest botanist of his generation. In 1683 he went to France, where he made the acquaintance of the French botanists. On his return he must have brought news of them—though Professor Thomson does not say so—to Robert Morison, the Sherardian Professor of Botany at Oxford, who had once been keeper of the gardens belonging to the Duke of Orleans. On his return to England Sloane was introduced to Sydenham, who took a liking to him and to whose practice he ultimately succeeded. He then spent twenty months in Jamaica as physician to the Duke of Albemarle, then recently appointed governor of the island. In Jamaica he continued his study of botany and married the wealthy widow of a sugar planter. By this time he had become a Fellow of the Royal College of Physicians and a Fellow of the Royal Society, becoming in later years the president of each society. Sloane went from honour to honour, obtained a large and fashionable practice, attended Queen Anne in her last illness, was created a baronet on the accession of King George II, and tactfully led the Princess of Wales (afterwards Queen Caroline) to believe that she had instigated him to have her two daughters engrafted with the smallpox. He died at Chelsea on January 11, 1753, "without the least pain of body, and with a conscious serenity of mind he ended a virtuous and beneficent life."

Sloane had always collected everything that was curious and valuable, and his executors were instructed to offer his treasures to the King for the sum of £20,000. The offer was not accepted, but an Act of Parliament was passed entitled "An Act for the purchase of the Museum or Collection of Sir Hans Sloane, Bart." By this Act £100,000 was ordered to be raised by lottery. The Act passed, the money was raised, the mansion of the Duke of Montague was bought, and the new British Museum was opened for study and public inspection on January 15, 1759, just six years after the death of Sir Hans Sloane. Sloane Street in Chelsea preserves his name, and until recently the greater part of the east side was a market garden. A statue of him stands in the Physic Garden and his tomb is in Chelsea churchyard.

PHILEMON HOLLAND

Through its special numbers, which are always interesting, *Medical Life* deserves well of the profession by bringing vividly before it bio-bibliographical studies, often generously illustrated, of some of the lesser-known characters in the history of medicine. In its July issue Dr. Herbert Silvette of the University of Virginia department of physiology attempts to resurrect the indistinct figure of one who to-day is more familiar to classical students than to physicians.

Philemon Holland, son of a Protestant clergyman, was born at Chelmsford, Essex, in 1552, and was educated at Trinity College, Cambridge, taking his M.A. in 1574. About 1595 he had the M.D. conferred on him, possibly by a Scottish or a foreign university. He practised in Coventry as a physician, and for a time was a school-master. Married for half a century, he had seven sons and three daughters, though only one son survived him. His last years were clouded by poverty and illness, and he died in 1637.

Deeply read in the medical classics, Holland's knowledge of Latin was accurate and profound. He translated Livy in 1600, Pliny in the following year, and Plutarch's *Morals* in 1603. The *Natural History* of Pliny the Elder was for centuries a medical Bible, but in Holland's time its authority was beginning to wane. Only a few years later Sir Kenelm Digby was to be called the very Pliny of the age for lying. Holland's translation, *The Historie of the World. Commonly called, the Naturall Historie of C. Plinius Secundus*, was published in two folio volumes in 1601 and in a revised edition in 1634. It is elegant and ornamental even for an ornamental age. The translator prefers two words to express the meaning of one, often suggesting alternative words to display a single idea in various lights. His imagination was vivid and vigorous, and no man was happier in his style. His notes are brief and few, and probably satisfied his contemporary readers. When he catches Pliny in errors, especially in his accounts of plants and herbs, which he corrects from Theophrastus or Dioscorides or from his own experience, he chides him gently. His medical mistakes, however, he is firm enough in bringing to light.

W. R. B.

ALEXANDER SKENE, 1837-1900

Alexander Johnston Chalmers Skene, whose name is familiar to medical students through "Skene's glands" of the female urethra (1880), forms the subject of a sympathetic sketch in the *Long Island Medical* for September-October, 1937. Born on June 17, 1837, in Scotland, he went to America at the age of 19. Studying medicine at Toronto, the University of Michigan, and the Long Island Cottage Hospital, New York, he took his degree in 1863. After serving in the Civil War he became professor of diseases of women and of clinical obstetrics at the Long Island College, and subsequently dean of the Faculty and president of the College. In 1876 he helped to found the American Gynecological Society. A sound and popular teacher, he wrote numerous textbooks and a novel. Among his hobbies were modelling and sculpturing.

The following theses on British medical men have recently been published by the Institute for the History of Medicine of the Medical Academy at Düsseldorf, of which Professor Wilhelm Haberling is the director: John Hennen and John Pringle, their significance and services in the development of the English Military Sanitary Service, by Lothar Horeysek; the contribution of Robert Willan and Sir Erasmus Wilson to the development of dermatology, by Hermann Thumm; historical notes on the discovery of anaesthesia with special reference to the work of Henry Hill Hickman, by Kurt Waterman; and William Smellie's contributions to the development of obstetrics, by Fritz Bürger.

remain enlarged and suppuration take place; this may not cause much pain and may therefore be overlooked. Thus whenever pyrexia is continued, although the area of cellulitis is progressing satisfactorily, the lymph glands should be examined, as an abscess may form in them some days or even weeks after the cellulitis has been got well in hand. It is a mistake to incise lymphatic glands before they suppurate: no incision should be made until one is sure from the physical signs that pus is present. When a localized abscess is opened it heals well and quickly, whereas an incision made too early may cause infection to spread further. Hot fomentations for the enlarged glands associated with lymphangitis will do good by hastening resolution or accelerating suppuration as well as by relieving pain.

The course of cellulitis with its associated lymphangitis is greatly altered by appropriate and well-judged treatment. In the aged and those of poor resistance a certain mortality occurs from septicaemia and pyaemia. In all cases there is likely to be some degree of permanent stiffness when the cellulitis is extensive and especially where the fingers are concerned.

SCIENCE AND INDUSTRY

The annual report of the Department of Scientific and Industrial Research¹ opens with a tribute to the late Lord Rutherford and his inspiring leadership during the seven years he was chairman of the Department's Advisory Council. The reports which have appeared annually over his signature during that period all bear testimony to the strength of his conviction that the prosperity of this country can only be assured if its industries make the fullest use of the technique and the discoveries of science. His last act as chairman was the shaping of the present report, which is signed by Lord Riverdale (formerly Sir Arthur Balfour), the new chairman of the Council.

During the year consideration has been given to directions in which it may be possible to strengthen the contacts between industry and the National Physical Laboratory. The report records substantial progress in practically all directions of the Department's work, both in the researches carried out by the research establishments of the Department itself and in the laboratories of the research associations, formed on a co-operative basis in various industries under the Department's auspices.

Storage and Transport of Food

A short time ago a new system of refrigeration was developed at the Ditton Laboratory, known as the "jacket" system. The new system has been installed with modifications in most of the new tonnage in the Australian and New Zealand trade, and during the year arrangements were made for officers of the Department to sail in some of the ships so equipped to examine its practical working. The basis of the investigation had to be wide, since the system involved changes in the method of carriage of all the ships' refrigerated cargoes, including butter, cheese, frozen meat, chilled meat in gas storage, pears, and apples.

The success that has attended the commercial development of gas storage of home-grown apples—that is, storage in an atmosphere containing just the right amount of carbon dioxide—is well known. A second investigation carried out with William pears and with Conference pears has shown that the pear responds to gas storage even better than the apple. When gas-stored the pears ripen more slowly on removal from store, thereby allowing the trade more time for marketing them.

To meet the increasing demands of the trade for information as to the behaviour in store of fruits and vegetables, not previously stored in quantity, trials have been carried out

with strawberries, hot-house grapes, broccoli, and peas. The previous work with plums has been extended, and gas-storage trials with asparagus have begun.

The Shoe and the Foot

Interesting work has been carried out during the year by the Boot and Shoe Research Association arising from investigations on "walking research" in which moving-picture records are taken of the gait of various people to study in detail the way they walk. The full results of this investigation will not be available for some time. As a result of knowledge already gained, testing machines have been designed for laboratory investigations of the response of different kinds of shoes to the forces acting on them during wear. One of these is a flexibility meter. In dress shoes flexibility gives comfort and elegance, and an instrument, the report states, which imposes on a shoe the correct kind of deflection and gives a measure of flexibility provides a means of investigating the different ways in which this property can be achieved. A second instrument investigates the character of the shank or waist of the shoe, an important feature in high-heeled shoes; and a third, not yet completed, is a machine which will put shoes through the motion of walking and give the soles the treatment they receive during wear. The object of this machine is to give information on the materials and constructions likely to give maximum durability in various circumstances.

Another matter which has come up during the year is occupational footwear—the need for designs and specifications of boots and shoes suitable for various kinds of industrial occupations. For example, what is the best kind of boot or shoe for a waitress to wear, or a nurse, a shop assistant, a policeman, a railway porter, a factory machine minder, and so on. Many large concerns and authorities take a great deal of trouble, and have a high degree of organization, in the welfare of their employees, and doubtless they would not hesitate to specify a certain shoe as part of their employees' uniform if they knew with certainty the best type of shoe for their special circumstances. "Safety boots" for miners and quarry workers is a case in point.

Other Points from the Report

Over half a million clinical thermometers were tested at the National Physical Laboratory during the year and 7,000 thermometers of other types. The Scientific Instrument Research Association has carried out on behalf of a member firm an investigation into the best form of "lensing" of clinical thermometers to enable them to be easily read.

Measurements with the noise-measuring apparatus developed at the National Physical Laboratory have been made on motor vehicles on behalf of a committee of the Ministry of Transport; the results have led the committee to recommend that a noise level of 90 phons should not be exceeded by any new motor vehicle offered for sale or for use on the public highway. Measurements for the Home Office have been made of the loudness of certain portable sound-making instruments intended for use as local alarm signals in connexion with air raid precautions. The Building Research Station is now taking up the problem of ventilation of buildings, and methods and instruments have been developed which will be first used in carrying out ventilation surveys in existing buildings. The extent to which a wall admits or excludes heat and therefore its effect upon the amount of heat required to keep the room warm is being investigated, for different types of wall, in six chambers of 8 feet cube placed side by side with one wall of each facing north. Tests are being made first with three 9-inch solid walls and three cavity walls all of Fletton bricks arranged alternately.

Synthetic resins have been produced which have the property of removing small quantities of materials from water passed through them. The possibilities of using these resins for the removal of boron and fluorine from natural waters is under investigation. Boron to the extent of a few parts per million in water used for irrigation is detrimental to the growth of certain crops. With regard to fluorine, recent surveys in different parts of the world have indicated that fluorine in drinking water to the extent of one part per million causes the dental defect known as mottled enamel.

Reports of Societies

TREATMENT OF ACUTE STREPTOCOCCAL INFECTIONS WITH SULPHANILAMIDE

In the Section of Surgery of the Royal Society of Medicine on February 2, Professor GREY TURNER presiding, the discussion was on the treatment of acute streptococcal infections by the use of compounds of the sulphanilamide group.

Dr. S. C. DYKE said that as a result of the introduction of drugs of this group there had been a remarkable change in the method of approach to acute infections due to haemolytic streptococci: the outlook in regard to these infections was now more hopeful. The results recorded by Colebrook and his co-workers at Queen Charlotte's left no room for doubt as to the value of the compounds in the treatment of acute haemolytic streptococcal infections. No comparable series of fully controlled clinical observations existed for what might be described as surgical cases, but the success achieved by Colebrook and others was an earnest of what might be expected when this particular method was more widely adopted. The present problem was not so much whether the drug was efficacious as the best method of its employment and the best type of compound to use. The effectiveness of *p*-aminobenzenesulphonamide and its benzyl derivative had now received ample demonstration. Both rapidly diffused in the system and were best given orally. There were available more complex soluble derivatives suitable for parenteral injection. They were effective, but their efficacy was not so well proved as that of the two compounds mentioned. In the present state of knowledge, so long as the oral route was available, it appeared safer to use one of these two compounds.

Sulphaemoglobinaemia

When the drug was first given the bluish-grey appearance shown by patients was disconcerting, but for the most part none of them seemed much the worse for the development of the cyanosis. Sulphaemoglobinaemia was of frequent occurrence, but only of importance when, owing to previous anaemia, an unduly large proportion of the haemoglobin became unavailable to carry oxygen, with resulting anaemia. This was readily remedied by blood transfusion, and was not a contraindication to the use of the drug. The incidence of sulphaemoglobinaemia was increased by intestinal fermentation, and therefore by purgation, so that all laxatives, other than liquid paraffin, were best withheld during treatment. Other manifestations seemed to fall mainly under the heading of idiosyncrasy. A recurrent temperature was a phenomenon to be watched for; it might appear from a week to ten days after the administration of the drug. Associated with it was a rash "looking more like measles than measles ever did," the only difference being that it was not associated with conjunctivitis or coryza. Some patients experienced a certain amount of nausea after each dose, but that again was no reason for withholding it. He had seen no toxic manifestations so far as liver and kidneys were concerned. He had given the drug to a number of diabetics suffering from severe generalized metabolic disturbances without any effect on their general condition. He believed the toxic possibilities of the drug had been somewhat exaggerated, always bearing in mind sulphaemoglobinaemia and the locking up of a certain amount of the available haemoglobin.

The tendency was to give too large doses of the drug. The maximum effect in haemolytic streptococcal infections could be obtained by relatively small doses—3 to 4 grammes daily for an adult, with corresponding reduction for children, for not more than a week. If the effect was not obtained within a week it was useless to proceed.

If at the end of a week there were signs of improvement then the drug should still be discontinued. The aim was not to destroy the streptococci in the tissues but to sway the balance of the fight. Once this had been done, the tissues could safely be left to deal with the matter, even though active streptococci might still be isolated from the original lesion by cultural methods.

The mode of action of the compounds of the sulphanilamide group remained somewhat obscure. Buttle had shown that in blood *in vitro*, containing its full complement of leucocytes, the drug exercised its full effect: if the leucocytes were removed the effect was very much modified. This led to the supposition that the action of the drug had something to do with the presence of the leucocytes in the blood. There was also evidence that the drug might have a stimulating effect upon the reticulo-endothelial system. This indicated that little could be expected from the application of the drug as a local antiseptic. Experience led him to the conclusion that acute streptococcal infection in its early stages required sulphanilamide and rest, with abstinence from the use of the knife for at least ten days.

Judicious Surgery

Mr. P. H. MITCHNER advocated the use of the knife at a considerably earlier stage. Where there was much local tension judicious surgery not only relieved it but permitted the escape of toxins and streptococci which would otherwise be absorbed into the circulation, and by relieving pain ensured rest. In the early stages of septicaemia it was not always certain that the infection was a haemolytic streptococcal one, and thus it was necessary to consider other treatments than prontosil—the only form in which he had used the drug. Excellent as prontosil was in some cases, it was useless in the fatal condition of staphylococcal septicaemia, which, clinically, so closely resembled any other severe septicaemia. Local incision into pus should not be hurried; there should be a certainty of localization of the pus. Maintenance of the fluid intake was important when treating septicaemic patients. Saline was more efficacious than blood transfusion in such cases, and generally should be administered by the subcutaneous, not the intravenous, route. Alcohol was beneficial in cases of severe septic infection.

As to the dosage of the drug, he usually prescribed two 3-gramme tablets on the first and second days, and afterwards, if the temperature had not dropped or the pulse rate remained high, one tablet a day for a week, or until such time as the temperature and pulse rate were normal. Usually the maximum result was obtained in eight days. If the infection did not yield within forty-eight hours to 6 grammes given by mouth it was practically certain that the patient had not a haemolytic streptococcal infection. In suspected cases of staphylococcal septicaemia he gave both prontosil and staphylococcal serum. In cases in which it was not possible to obtain a prompt bacteriological report, or in which prontosil failed to have the desired effect, there was justification for giving either intravenous antiseptics—preferably perchloride of mercury—or serum. Unless there had been general toxæmia serum was in his experience of no benefit in erysipelas, either in checking the spread of the local lesion or in preventing relapses. Lately, however, following the use of prontosil, the vast majority of patients at St. Thomas's suffering from severe erysipelas had been completely cured in from eight to ten days. The results in cellulitis, even haemolytic streptococcal cellulitis, were by no means so satisfactory. The local condition did not improve unless judicious surgery was resorted to at a considerably earlier stage than Dr. Dyke had advocated.

General Discussion

Mr. T. B. LAYTON, speaking of streptococcal infections as a whole, was not prepared to admit that for the first time medicine had a specific and effective remedy against

SISTER KENNY METHOD IN INFANTILE PARALYSIS

THE BRITISH
MEDICAL JOURNALTREATMENT OF INFANTILE PARALYSIS
BY SISTER KENNY'S METHOD
REPORT OF QUEENSLAND COMMISSION

At Queen Mary's Hospital for Children, Carshalton, an experiment in the treatment of anterior poliomyelitis, which has already aroused considerable interest, is in progress. A ward has been set aside at this L.C.C. hospital, and the children there are treated by what is known as the Sister Elizabeth Kenny method, the clinic being organized by Sister Kenny herself. Articles on the treatment of spastic paralysis (*Journal*, August 28, 1937, p. 414) and on the treatment of acute poliomyelitis (January 22, 1938, p. 168), both by Dr. F. H. Mills, who has been collaborating with Sister Kenny, have been published in these columns, together with some comment on this experiment (January 22, p. 178). By courtesy of the Editor of the *Medical Journal of Australia*, Dr. Mervyn Archdall, we have received advance proofs of the issue of that journal for January 29, a large part of which (thirty-six pages) is devoted to the report of the Queensland Royal Commission on Modern Methods for the Treatment of Infantile Paralysis. The Royal Commission, consisting of Drs. Aeneas J. McDonnell, A. E. Paterson, J. V. J. Duhig, J. Bostock, L. J. J. Nye, C. A. Thelander, L. W. N. Gibson, and R. S. Lahz, was set up in October, 1935, to observe cases before, during, and after treatment at Sister Kenny's clinic, and to report thereon.

The Commissioners, in their report, have considered the whole question and have examined and re-examined forty-seven cases treated by Sister Kenny. The periods between the first and the final examination in these cases varied from only five months to about two years. There are several appendices to the report, one of them drawing attention to the first article by F. H. Mills published in the columns of the *British Medical Journal*. The Commission "in no spirit of carping . . . really finds the claims in this article confusing and unsubstantiated; and considers it remarkable that such should be published in a reputable medical journal." The findings of the Royal Commission are summarized, as follows, at the end of its report.

Summary of Findings

"After two years' study of the work of the Elizabeth Kenny Clinic at Brisbane, from the evidence of Miss Kenny and of experts acquainted with her work directly and indirectly, the Commission has arrived at its conclusions on the Kenny method of treating paralysis. For the purpose of convenience we refer to the method of treating infantile and spastic paralysis used by expert medical practitioners as the 'orthodox' treatment, and to that of Miss Kenny as the 'Kenny method.' We have found that:

1. Except in one important principle the Kenny method of treating poliomyelitis differs very little at present from orthodox treatment. Where there is a difference the orthodox method is better.

2. Originally the Kenny method showed radical departure from orthodox treatment, but in the course of time the former has gradually been brought into conformity with the usual medical practice.

3. The departures from orthodox treatment, especially the present important points of difference, could be and actually were responsible for damage beyond and in addition to that already sustained by the patient.

4. Of a series of patients, forty-seven in number, examined by the Commission two years ago and since re-examined at least once and sometimes twice or three times the majority showed no effective improvement, a few were worse and a few improved. Those who became worse would not have

done so under orthodox treatment, and those who improved would have done so to an equal or greater extent under orthodox treatment of equivalent intensity.

5. It is significant that in her original forecasts of the patients' chances of cure Miss Kenny was highly optimistic, occasionally to the point of being fanciful. Later she became more cautious. We interpret this inconsistency as a consequence of Miss Kenny's unfamiliarity with the nature of the work she was undertaking and as proof that she learnt as she went along not only caution but orthodox technique as well.

6. The return to the people of Queensland from Government expenditure on account of the Kenny clinics was disproportionately small. The return would have been much greater if the same amount of money had been spent in already existing orthopaedic departments of public hospitals and on vocational training. For many cases of paralysis treated by Miss Kenny nothing further could have been done. The slight improvement in others, of little real use to the patient, involved a waste of time spent in treatment which might have been used to better advantage.

7. The belief held by many people in the possibility of improvement in the reality of improvement by the Kenny method, despite of facts to the contrary, is attributable to Miss Kenny's strong personality; her own conviction of technical competence and to improvement in patients treated by her, all of which combined to inspire the patients and relatives with great hope and especially with unshakable loyalty to Miss Kenny.

8. Miss Kenny may claim credit on two counts. Though she has neither discovered nor applied any new principle, she has drawn attention to the plight of the crippled child, who was too often denied hope of possible further usefulness. Some children suffering from spastic paralysis did improve very much under her treatment, which differed from orthodox treatment only quantitatively. The Commission believes that a trained masseuse can obtain similar results if given the same opportunity of concentrated attention on a given case.

9. Action taken to make effective Miss Kenny's claims was unbalanced. For the most part it was political, without really expert preliminary investigation. Many cripples, beyond further aid, wasted their time and public money in a repetition of treatment (modified in some cases for the worse), the possibilities of which they had already exhausted. The state of affairs was made worse because of Miss Kenny's inadequate knowledge of the conditions and mechanisms amongst which she was to test her theories and assumptions.

10. Miss Kenny's method adds little of value to orthodox treatment and discards principles which sound opinion considers essential. The method of re-education is no better than orthodox treatment; indeed it is faulty, as already stated, and has no advantages that would enable treatment to be efficiently carried out without splints.

11. The Commission cannot recommend the application of the Kenny method to the treatment of cripples at any stage of paralysis, and especially not to the treatment of the acute or early stage.

12. If the Government takes the responsibility of rejecting the advice implied in this report and decides to allow the Kenny clinics to remain, the Commission strongly urges that they be placed under the control of a competent orthopaedic surgeon or surgeons, with the object of rejecting obviously hopeless cases, of avoiding the cruelty of disappointed hopes, of saving public money, and, in general, of getting a sane and balanced view of the patients' possibilities.

13. The Commission also urges that the re-educative care of paralysed or paretic muscles needs a highly trained staff, that attendants at paralysis clinics should receive practical training in anatomy and physiology, and that some adequate standard of general education should be demanded from those undertaking the care of cripples at the clinics.

14. Where no further improvement in the condition of the cripple can reasonably be expected the Commission urges again that attention be directed to vocational training, and especially to the provision of employment.

BIRTH Palsy

Clinically, birth palsy is strictly comparable with poliomyelitis. All references to the re-educative treatment of the latter disease apply exactly to that of birth palsy, with even more stress on the necessity of proper splinting."

his early days heroic methods of hydrotherapy were practised, but he had come to the conclusion that tepid or even warm baths produced equally beneficial effects. He also referred to the insidiousness of the symptoms in many of these cases; he had never convinced himself that it was possible to detect a pre-perforative stage. The greatest advance in the treatment of typhoid, in his opinion, was dietetic—the change from the starvation diet once current to the liberal diet now provided. Serum treatment was not new, and he was not entirely convinced that the claims made for this form of treatment in recent years had been justified. In the past it was his experience that similar results had been obtained with sera and with vaccines, and this made it difficult to ignore the possibility of a non-specific factor.

Immunization

Dr. A. FELIX (Lister Institute) said that in the early days of typhoid serum no animals were available for estimating virulence, but that had now been changed. In diagnosis it was his experience that blood culture was little used in this country as compared with the Continent. With regard to carriers, Vi-agglutination had been noted by him in a large proportion of cases. He believed that a patient might be infectious in the incubation period, with positive blood cultures before the onset of fever. Early use of serum was therefore indicated, both in prevention and in treatment. In the later stages little benefit would be obtained. The prophylactic use of serum was definitely called for, especially in a water-borne epidemic.

Dr. H. S. BANKS (Park Hospital, L.C.C.) said that whenever typhoid cases were sufficient in number to fill a ward in a hospital a high proportion of the nurses on duty became infected unless immunized. It was essential to maintain active immunization of the nursing staffs of fever hospitals, also to provide convenient washing and sanitary arrangements in every ward. In the specific treatment of toxic typhoid fever by Felix's serum he had at first encouraging results, but during the past year results had been disappointing. [Dr. Felix had previously explained that recently the supply of the serum in which he was interested had not always been quite equal to the demand, and on two occasions serum of rather lower antibody content than usual had been issued; on both occasions an experienced user of the serum, unaware of the alteration, had complained to him.] Apart from specific treatment Dr. Banks regarded the modern high-calorie diet in typhoid as the chief advance of the last twenty-five years. It was impracticable as a rule, however, to give a balanced diet of 4,000 calories in the second and third weeks. The diet which he tried at these periods was from 1,600 to 2,300 calories, and it required considerable nursing skill to give even that amount.

General Measures

Dr. ROBERT CRUICKSHANK (L.C.C.) recommended bacteriological examination of the faeces, emulsified in a preservative of 30 per cent. glycerin in 0.6 per cent. saline, as an early diagnostic method suitable to the general practitioner. Dr. J. REID (Motherwell) said that he had listened with interest to Dr. Goodall's observations on perforation. He emphasized the importance of early diagnosis and operation on suspicion. A steady increase in the pulse rate in a patient who complained of sudden abdominal pain within the perforating period was to be taken as sufficient evidence to suggest operation. Delay until characteristic signs of peritonitis were obvious made matters hopeless.

Dr. F. GRUNDY (Luton) said that the control of the enteric infections in non-epidemic times was very largely a question of control of carriers, especially carriers associated with water undertakings, milk supply, and bulk handling of foodstuffs. It might be that the power at present given to the medical officer of health and to the local authority would need to be reviewed in the light

of recent happenings to ensure a full control of carriers of epidemic infections. For a reasoned consideration of existing and projected regulations answers to the following questions were desirable: What proportion of a community not recently subjected to any unusual risk were either intermittent or chronic carriers, and of these what proportion had previously suffered from a diagnosed enteric infection? To what extent was the position different in a localized community recently subjected to special risk, and for how long was the difference likely to persist? Further, with regard to water-borne infection, what degree of contamination of a water supply might reasonably be supposed to place a community at risk?

ASSOCIATION OF CLINICAL PATHOLOGISTS

The eleventh annual scientific meeting of the Association of Clinical Pathologists was held at St. George's Hospital, London, on January 29, with Dr. J. Boycott in the chair.

Blood Fragility Tests

The first paper, on blood fragility tests, was read by Dr. E. F. CREED. Dr. Creed described his technique for estimating the fragility of red blood corpuscles. He found the simplest method of ensuring accuracy in the strength of the sodium chloride solutions was to make up a stock 25 per cent. solution, and prepare dilutions from this when required, using a dropping technique for the final stages. The amount of haemolysis at each dilution was estimated by matching against colour standards, and the results were plotted as a curve. He emphasized the effect of the viscosity of the blood on fragility, and showed how discrepancies due to this could be eliminated by aeration of the blood before testing. Fresh untreated blood was used to avoid any risk of altering the fragility by preliminary treatment and to retain the buffering effect of the plasma. He thought that the increased fragility said to be found in some cases of alcoholic jaundice only after washing was due possibly to increased liability to changes in pH in the absence of plasma. When interpreting fragility results the degree of anaemia had to be taken into account, as the corpuscles of anaemic blood showed an increased resistance to hypotonic saline. He suggested that results should be recorded either as a curve or as the dilutions at which given percentages of corpuscles were haemolysed. He showed the narrow limits within which fragility curves normally fell, and the constancy of these curves in single individuals over long periods.

Dr. C. J. YOUNG then read a paper in which he drew attention to the fact that splenectomy was not always successful in the treatment of acholuric jaundice. Splenectomy and transfusions failed to arrest a haemolytic crisis in one case, but after the removal of a degenerating ovarian teratoma complete recovery ensued. It was suggested that the haemolysis was directly or indirectly related to a toxæmia due to the ovarian tumour, although this could not be the only factor in its causation. Although splenectomy had been recommended to prevent the occurrence of haemolytic crises, it was clear from this and other recorded cases that it could not be guaranteed to do so.

Plasma Bilirubin

Dr. JANET VAUGHAN described observations made in collaboration with Dr. Haslewood on the level of plasma bilirubin in normal and pathological subjects. The values found in 100 healthy men and women, using the method of Haslewood and King (1937), had varied between 0.2 mg. and 1.7 mg. per 100 c.cm., 93 per cent. of the figures falling between 0.2 and 0.8 mg. per 100 c.cm. The high figures had all been noted in men. She concluded that there was no justification for excluding such figures, as previous workers had done, and suggested that until further work was available levels varying between 0 and 1.3 mg. per 100 c.cm. should be considered as probably

SULPHANILAMIDE IN STREPTOCOCCAL INFECTIONS

THE BRITISH
MEDICAL JOURNAL

the haemolytic streptococcus. The haemolytic streptococcus was so constantly the cause of inflammation of the middle-ear cleft that it was quite legitimate to assume that every case arose from a streptococcal infection. If surgeons were to be permitted to see cases only when pus had been well localized and walled off, he feared it would mean going back to the mortality experienced in an earlier era, though he admitted that in cases of meningitis which had been left too long, in which the onset of the disease had become advanced, and in which the physicians had refrained from calling in an otologist at an early stage, prontosil had proved the means of saving a few lives, whereas previously all such cases had been lost. Was it yet proved that the organisms in the blood stream, but did not touch the organisms in a local lesion. If that was so, there was still room for far more surgery than had been indicated by Dr. Dyke.

Miss KENNY, a co-worker with Dr. Colebrook, gave details of the results obtained by the use of prontosil in the treatment of puerperal sepsis at Queen Charlotte's. Established cellulitis did not respond so satisfactorily, but one had developed a cellulitic spread from the uterus, which meant that the duration of illness had been greatly reduced. Professor CLELAND, an Australian pathologist, mentioned a post-mortem observation on a case in which prontosil had been administered, and from which it appeared that the streptococcal infection had been controlled in parts accessible to the drug, but had remained established elsewhere.

Professor PATERSON ROSS referred to the kidney lesion which was sometimes a serious complication in haemolytic streptococcal infection. He wondered whether the high urea content of the blood might indicate not the effect of the recent haemolytic streptococcal infection but rather an older damage to the kidney. Further, was the damage to the kidney permanent, or was function likely to be restored after the acute infection had passed off? In two cases of streptococcal infection with renal damage there was severe colicky abdominal pain. Was that a symptom of the acute infection, or was it particularly associated with renal damage? Mr. E. C. B. BUTLER gave results in a series of cases treated with prontosil at the London Hospital. This revealed definite indications for its administration, but at the same time suggested that it must not be regarded as a panacea. It had definite toxic properties. Mr. CHARLES DONALD expressed surprise at Mr. Mitchiner's advocacy of such early incision. The fluid was really there to deal with the infection, and was, at least in the early stages, beneficial, not necessarily toxic. Dr. G. A. H. BUTTLE said that it appeared that some strains of the staphylococcus were more susceptible to sulphanimide than others, so that possibly from the point of view of laboratory evidence large doses of the drug might be worth trying if a case was regarded as hopeless from other points of view. In regard to middle-ear infections he had heard from Dr. Massingham of the London Fever Hospital that in cases of scarlet fever, since the giving of about 3 grammes of sulphanimide a day, there had been no case which had called for mastoid operation.

Professor GREY TURNER said that it would be agreed that the discovery of the compounds of the sulphanimide group constituted a valuable addition to the therapeutic armamentarium. He had been impressed by the importance of early pain in cases of streptococcal infection. A mild injury if attended by intense pain suggested such a development. No speaker had touched on the prevention of acute streptococcal infections following, for example, street accidents. When dealing with diseases arising from such organisms as haemolytic streptococci it was important to know whether the patient was in a good state of health when the infection occurred. It was a bad prognostic feature if patients with acute streptococcal infection were unable to take nourishment. He

wondered what would be the long-term effect of prontosil and similar drugs on sepsis. The organisms persisted in the body when there was no evidence of their activity. As yet there were no effective means of preventing recurrence of staphylococcal infections. Was health likely to be promoted on these lines by the use of prontosil, or was it only of avail in the immediate illness? Dr. DYKE, in reply, said that despite what Mr. Mitchiner and others had said as to the desirability of early incision in cases of streptococcal infection, he held to his view that the time for the use of the knife was late, not early. As for kidney manifestations in haemolytic streptococcal infections, a large number of patients showed albuminuria and pus in the urine. Colicky pain was sometimes associated with uraemia. Mr. MITCHNER, also in reply, said that he had stressed the necessity that incision should be judicious. He maintained with all deference that in many early cases of streptococcal infection judicious surgery was extremely valuable.

PREVENTION AND TREATMENT OF THE
ENTERIC DISEASES

At a meeting of the Fever Hospital Medical Service Group of the Society of Medical Officers of Health on January 28 a discussion took place on the enteric group of diseases. Dr. J. A. H. BRINCKER presided.

Administrative Control

Dr. ANDREW TOPPING (London County Council), in opening, said that under modern conditions water-borne epidemics could not normally occur; when they did the were due to a combination of fortuitous events, frequent unavoidable. Milk and other foodstuffs were much commoner mediums of infection, and until proper control of milk supplies and reasonable facilities for detecting and eliminating carriers were legally enforceable sporadic, and sometimes epidemic, outbreaks would occur. The medical officer of health could do much to prevent any serious outbreak by organization in the non-epidemic periods; if relations with local practitioners were cordial it might be ensured that indefinite febrile illnesses and the possibility of carriers working on farms and in dairies were investigated. Laboratory facilities should be available and used regularly. Investigation should be made as a routine in cases of pyrexia of unknown origin and the like. A great deal could be done to educate the public, who, if they were informed as to the real causes and modes of spread, would be less likely to give way to panic. It must be made plain to them that the causative organisms were not disseminated through the air or lying in wait for people at the street corners. Dr. Topping also sketched the methods of control necessary when cases developed in hospital. In his opinion a contact could not pass on infection during the incubation period, and a realization of this fact would obviate much needless dislocation of hospital practice. As to specific immunological measures, he pointed out that the number of potential sufferers from an infected water supply was so enormous that the cost, the discomfort of the large numbers of people who would undergo injection, as well as the lack of unanimity among immunologists as to the efficacy of the procedure in the presence of infection, might well be held to outweigh the advantages. Passive immunization of those who had been in contact with a case had much more to recommend it.

Improvements in Treatment

Dr. E. W. GOODALL, late medical superintendent in the London Fever Hospital Service, who was to have been the second opener, was unable to be present, but sent a paper dealing with the principal improvements which had taken place in treatment during his long experience. In

view that in about four cases out of five the testis descends spontaneously by the age of puberty; (2) possible disadvantages of delayed descent with reference to atrophy and interference with function after puberty; and (3) development of the treatment by hormones and a comparison of the results published in the literature and those of a series of personal cases. The disadvantages and dangers of the treatment were emphasized. The speaker then made brief reference to operative procedures, and came to the following conclusions: (1) Pregnyl is of value in the treatment of undescended testis: a proportion of cases which would otherwise require surgical treatment respond to injection therapy. (2) In those cases associated with hernia and hydrocele, in which hormone treatment usually fails to secure descent of the testis, a preliminary course of injections is of value, leading to increase in the size and vascularity of the testis and development of the scrotum, and thereby improving the prospects of operation. As a post-operative measure injections are of value. (3) In bilateral cases hormone treatment should be begun about the age of 6 years, except in minor degrees of the deformity. Unilateral cases require individual consideration. In those cases needing surgical intervention the Ombredanne and Thorek methods are recommended.

In the discussion which followed the PRESIDENT said he thought that many years must elapse before the dangers of over-stimulation by sexual hormones in growing children could be correctly assessed. Mr. COSBIE ROSS surveyed the results of endocrine therapy in these cases. He pointed out that this method had been used for a longer period in some American hospitals, and quoted Campbell as saying that while congestive enlargement of the testicle and full descent might occur as a result of a course of injections, in many of these cases the testicle had returned to its former site and had resumed its previous size a few months later. These observations would appear to indicate that hormone therapy should be used as an adjuvant to surgical measures, and Mr. ROSS considered that the optimum time for operation was when the hormone therapy had achieved its maximal effect. The importance of operative correction of bilateral cases was emphasized by Moore's experimental work, when the normal descended testicle of an animal was transplanted back into the abdomen and some time later was shown to have lost the power of spermatogenesis. This was due to the increased temperature in the abdomen, and it emphasized the important thermal function of the scrotum, which acted as a "testicular radiator." With regard to the age at which operation should be carried out, the speaker thought that this should be done in bilateral cases before the age of 8 years. During the eighth and ninth years of age pubertal changes were already in progress, and if the full physiological effect of the operation was to be obtained it should be carried out before these changes began. In unilateral cases he was prepared to wait until puberty. Finally, Mr. ROSS said that the whole question of the treatment of undescended testicle was overshadowed by the hernia which was present in the majority of cases. Neither endocrine therapy nor procrastination was justifiable when the condition was complicated by the presence of a hernia. Dr. JOHN D. HAY asked if the increased virilism and enlargement of genitals produced in some of the cases by injections of pregnyl persisted after the cessation of the injections.

Dr. A. G. C. FFOLLIOTT described two cases: first, that of a boy with undescended testis high up in the left inguinal canal, which descended spontaneously at the age of 18; and, secondly, the case of a boy aged 7 with bilateral undescended testis high up in the inguinal canal, with marked symptoms of dystrophia adiposo-genitalis, which responded to a course of pregnyl injections given twice weekly. The left testicle descended after the sixth injection, and the right after the tenth.

Mr. W. A. THOMPSON believed that the treatment of undescended testis was of such importance that closer observation and more careful records should be made by

those who dealt with the condition in large numbers. He had seen over 400 cases, and had operated on 271. In his cases the following points were observed: (1) one in nine was bilateral; (2) 40 per cent. descended of their own accord, and this descent occurred during the first 2 years of age in 5 per cent., from 2 to 5 years in 10 per cent., from 5 to 10 years in over 15 per cent., and from 10 years onwards in under 10 per cent.; (3) hernia was found to be associated in only 35 per cent. of cases; and (4) it appeared that torsion was not seen so often now as formerly, this being possibly due to the fact that these cases were under supervision and that pain in an undescended testicle was regarded as a partial torsion and an indication for operation. The presence of a hernia also called for operation. Mr. Thompson said his practice now was to operate at 10 years of age, thus permitting a third of the cases to descend and, in the others, anticipating the physical and physiological changes of puberty. Regarding the results of operation, over two-thirds were uniformly good clinically. In 10 per cent. the testicle had to be removed; in 10 per cent. it atrophied. The rest of the results could only be described as moderate. He had been disappointed and frightened at the results of pregnyl injections, which appeared to require serious consideration as to the future state of the patient.

At the same meeting Mr. BRYAN WILLIAMS read a paper on a series of cases of stillbirth and neonatal death.

PAGET'S DISEASE

At a meeting of the Southern Medical Society of Glasgow on January 27, Dr. JAMES F. BRAILSFORD discussed the frequency, diagnosis, complications, and treatment of Paget's disease of bone.

Dr. Brailsford said that Paget's picture of the clinical features of the disease, as he first described it in 1876, was so complete that but little had been added to it since that time. He analysed his findings in 154 cases, of which eighty-two were males and seventy-two females. The youngest patient was aged 27 and the oldest 87. Only one patient fell in the age-group between 20 and 30, there were five between the ages of 30 and 40, twenty-four between 40 and 50, fifty-three between 50 and 60, fifty-three between 60 and 70, thirteen between 70 and 80, and five were over 80. The site at which the disease was first discovered was the pelvis in fifty-eight cases, the tibia in thirty-seven, the femur in twenty-two, the head in thirteen, the spine in thirteen, the humerus in eight, and the os calcis in three. Fractures of the tibia were noted in seven cases, of the femur in eight, of the humerus in five, and of the pelvis in three—that is, twenty-three cases in all. Malignant changes were observed in only six patients, in two affecting the pelvis, and in the remaining four the tibia, femur, scapula, and spine respectively. In most cases the condition was discovered accidentally during radiographic examination of the spine or pelvis in patients who were complaining of pain or discomfort or who were suffering from a spontaneous fracture. Only patients with a bowed tibia were clinically suspect. The bones affected were expanded and plastic, and the lesions seen radiographically were of three types: (1) those exhibiting decalcification, (2) those exhibiting a general increase in density, and (3) those exhibiting fusion and increased density and thickness of the peripheral and main trabeculae in which lanceolate, ovoid, or rounded areas resembling bone cysts were apparent. The disease began either in the endosteal or in the periosteal tissue. In the latter the periosteum appeared to be stripped from the bone by a deposit of osteoid tissue between it and the cortex. Only in that segment of the bone from which the periosteum had been stripped did decalcification and absorption of the original shaft occur. It followed that in the bone which had an intact periosteum the density and structure were normal.

normal, while figures between 1.3 and 1.7 mg. per 100 c.cm. should be regarded as probably but not necessarily pathological. In fifteen cases of typical Addisonian pernicious anaemia with red cell counts below 3,500,000 per c.mm. only three patients had been found to have a plasma bilirubin above 1.1 mg. per 100 c.cm.; the average figure was 0.93 mg. per 100 c.cm., which was well within normal limits. She suggested that this divergence from accepted teaching was due to the fact that patients with Addisonian pernicious anaemia now received treatment at an early stage of the disease, before pigment not utilized had had time to accumulate. There was no essential difference in pigment metabolism between Addisonian pernicious anaemia and other megalocytic hyperchromic anaemias reacting to liver. In nine examples of hypochromic anaemia in middle-aged women she had found an average plasma bilirubin of 0.15 mg. per 100 c.cm., with a range of 0 to 1.3 mg. per 100 c.cm. In seven patients with acholuric jaundice, before splenectomy the range had been 0.7 to 2.3 mg. per 100 c.cm.; after splenectomy it always became normal. Dr. Vaughan, in conclusion, suggested that the level of plasma bilirubin was not necessarily a true index of the metabolism of blood pigment, just as the level of serum calcium was not always a true indicator of the normality of calcium metabolism.

Hypochromic Anaemia in Infancy

Dr. H. W. FULLERTON discussed the part played by maternal iron deficiency in the aetiology of the hypochromic anaemia of infancy. Analysis of the haemoglobin levels of 167 mothers and their infants between the ages of 9 and 16 months revealed no significant correlation between maternal anaemia and anaemia in the offspring. This finding did not support the view generally held that the infants of mothers suffering from iron deficiency have a normal haemoglobin level at birth, but develop hypochromic anaemia towards the end of the first year of life, owing to a deficiency in the iron stores in the liver at birth. A quantitative study revealed that even complete absence of liver stores of iron at birth could produce only a mild degree of anaemia in the infant after nine months. It was concluded that low birth weight was a much more important factor in the development of hypochromic anaemia in infancy. Dr. Fullerton also described three cases of severe macrocytic anaemia of obscure causation, one of which was associated with portal cirrhosis. The macrocytosis, he said, could not be attributed solely to a lack of storage of the anti-anaemic factor in a diseased liver. A depressant effect on the bone marrow of toxic products formed or retained as a result of liver failure was considered to be a possible cause, however. It was suggested that in those cases in which a partial response to parenteral liver therapy occurred, deficiency of the anti-anaemic factor might also exist, due either to a failure in production of "intrinsic factor," resulting from the gastro-enteritis which frequently precedes and accompanies liver cirrhosis, or to a failure in absorption of the anti-anaemic factor consequent on congestion in the portal circulation.

Anaemias and Tropical Diseases

Dr. N. HAMILTON FAIRLEY said that though in the deficiency anaemias the reticulocyte response to replacement therapy had been carefully studied, little had been done in the anaemias caused by bacteria and parasites. Tropical diseases afforded scope for such investigation. In malaria, following experimental infection, a haemolytic normocytic anaemia rapidly developed. After atebirin or quinine had been administered the temperature became normal and parasites disappeared from the peripheral blood, in six to nine days a maximal reticulocytosis ensued and was associated with blood regeneration. A fall from 5,500,000 to 4,000,000 erythrocytes per c.mm. might be succeeded by a maximal reticulocytosis of 8 or 9 per cent. In chronic malaria a similar phenomenon occurred, the reticulocytosis being inversely related to the red cell count, here the red marrow was already hypertrophied

and the reticulocytes somewhat increased before treatment had started. In blackwater fever an intense reticulocytosis followed intravascular haemolysis; anaemia consequent on blood destruction was the main factor involved. In amoebic liver abscess associated with mild degrees of anaemia, emetine injections caused the disappearance of fever, and a maximal reticulocytosis was noted some seven to ten days later. When there was secondary coecal infection such effects were not seen. Here a reticulocytosis persisted for many weeks, only disappearing with recovery. It appeared that malarial and amoebic parasites inhibited the erythroblastic response in both these diseases, acting either directly on the normoblast and preventing adequate reticulocyte formation, or indirectly by decreasing the availability of factors essential to normal haemopoiesis. Graphs showing the reticulocyte response in tropical sprue following the oral administration of liver extract and campolon were demonstrated, also the submaximal response and poor blood regeneration in cases treated by marmite and ventriculin, neither of which proved satisfactory. The more refined and concentrated liver preparations—anahaemin (Dakin and West fraction) and reticulogen (Cohn fraction)—gave lower maximal responses, and had to be given in relatively much larger doses than in Addisonian anaemia to be effective.

Blood Tests in Disputed Paternity

Dr. JOHN C. THOMAS read a paper on the blood grouping test in disputed paternity. After discussing the results of the test in nearly 10,000 cases abroad, he showed that if the test was used as a routine in England approximately 1,000 men who are involved in affiliation suits each year would be proved not guilty. In view of impending legislation it was necessary to standardize the technique of the test to ensure accurate and comparable results, and he outlined a routine grouping method, discussing the possible sources of error. He emphasized the absolute necessity for complete control tests of both the specificity and the potency of the sera, especially with the anti-A and the immune anti-M and N sera. The sera must be of known high titre, he said, and should be titrated at intervals; they should not be stored in capillary tubes. Weak sera often failed to detect the A2 agglutinin, especially in group A2B, and anti-N sera might be so weak as not to react with MN groups; it also often failed to react with the N2 factor. The use of a too strong cell suspension was a common source of error; no suspension stronger than 1 per cent. should be used. The test should never be performed at a temperature lower than 20° C., and might be done in tubes or on slides; titrations had always to be done in tubes. In either method a negative reading was only made after microscopical examination. If completely typical reactions were not obtained with the unknown and all the control cells, the test had to be repeated with fresh sera, at least three of each type being necessary. The cells should be tested always with two or three anti-M and anti-N sera. In all forensic blood groupings the serum agglutinins were examined as a check on the cell tests, and this was done preferably by titration. Only when there was a reciprocal relationship between the cell and serum tests could the results justifiably be taken into a court of law.

ENDOCRINE TREATMENT OF CRYPTORCHIDISM

At a meeting of the Liverpool Medical Institution on Thursday, January 27, with the president, Dr. E. G. BAYNE, in the chair, Mr. PHILIP HAWE read a paper on the treatment of undescended testis.

Mr. Hawe referred to the various dangers to which patients with undescended testis are liable, and to avoid which treatment may be necessary. He briefly reviewed the following subjects: (1) the possibility of spontaneous late descent: although in the past this has been thought unlikely after the age of 3, recent statistics support the

Chadwick Public Lectures

On Tuesday next, February 15, at 5.15 p.m., the twenty-sixth annual series of Chadwick Public Lectures will be started at Manson House, 26, Portland Place, London, W., when Major P. Blair-Hook of the South African Medical Corps will lecture on "Health Conditions in the Union of South Africa." This will be also the fourth and last lecture of the course by representatives of the Dominions. Sir William J. Collins, M.D., chairman of the Chadwick Trustees, will preside, and Major Blair-Hook will tell in word and picture the health story of the Union of South Africa from days of the early use by trading steamers of the Cape of Good Hope as a refitting station, through all the developments which geographical and race problems have brought about. On March 3 Mr. B. S. Townroe will discourse on "The Hygiene of Prisons," reviewing the Prison Acts from 1782 to 1898, describing present movements for amelioration and plans for future reforms, and giving account from his inspections of the sanitary conditions of many French, American, and English prisons. A series of slides showing interior and exterior conditions will illustrate the lecture. These lectures at Manson House will be followed by two in the theatre of the London School of Hygiene, Keppel Street, W.C., where, on March 24, Mr. W. J. E. Binnie will take "Water Supply in Relation to Public Health" as his subject. In May Professor Ernest Barker will speak on "The Community Centre in Relation to Public Health and Public Welfare." Admission to all Chadwick Lectures is free and no tickets are required.

SCOTLAND

Edinburgh Public Dispensary

At the recent annual general meeting of the Royal Public Dispensary of Edinburgh the Lord Provost, who presided, said that under an agreement with the corporation the old site of this dispensary had been made available for other purposes as part of the slum clearance scheme in the Richmond Street district. A new site and a substantial sum towards the cost of rebuilding had been contributed by the corporation, and the new building, now almost complete, would be opened in spring. The total number of patients treated in the past year had been 2,296, and the finances had been satisfactory with a surplus of revenue over expenditure of £220.

West of Scotland Neuro-Psychiatric Research Institute

At the annual meeting in Glasgow on January 31 of the Board of Management of the West of Scotland Neuro-Psychiatric Research Institute Dr. Ford Robertson, superintendent of the Institute, said that several publications on serology, haematology, and bacteriology in relation to mental diseases were in course of preparation. There had been progress on the Continent in recent years in the treatment of dementia praecox by cardiazol and insulin shock. It had been estimated that if patients suffering from dementia praecox were treated by the insulin shock method during the first four years an average of 46 per cent. recovered, while an even higher percentage of recoveries was claimed in cases receiving the cardiazol shock method of treatment. Research in mental disease in this country, he said, did not enjoy so much support from the public as research into bodily illness.

Aberdeen Health Services

The report by the medical officer of health of the city of Aberdeen on the medical inspection and treatment of school children, covering the year ended July 31, 1937, states that the dental section of the school services scheme continues to increase in popularity, and that the appointment of an additional whole-time dentist has been fully justified. Further additions to the dental staff are

envisaged in the near future. During the period under review the authorities have fostered an active campaign in connexion with immunization against diphtheria. A circular letter was sent to the head teacher of each school, together with a supply of handbills, consent cards, and record cards. The teacher was requested to give a handbill and consent card to each child. The handbills, addressed to parents, carried some very effective propaganda in favour of immunization. Those parents who were persuaded by the handbills signed the consent cards to permit immunization, and their names were then entered by the teacher on the record cards. As a result of this campaign 52.3 per cent. of school "entrants" were immunized. This figure, however, is not regarded as satisfactory, for, as stated in a previous report, a percentage of at least 80 is necessary to affect favourably the efforts to eliminate the disease and to relieve the strain on the infectious diseases hospitals.

Correspondence

Use and Abuse of Antiseptics

SIR,—May I reply to comments which have been made both in your columns and in personal correspondence on the articles by Mr. Geoffrey Keynes and myself entitled "The Use and Abuse of Antiseptics"? These have referred chiefly to the properties and use of acriflavine. In the first place, by deploring the cost as well as the unsuitability of iodine we did not intend to convey that all the preferable alternatives are inexpensive; this is true of Harrington's solution but certainly not of acriflavine, although the 0.2 per cent. solution recommended for the treatment of wounds is more economical than Tinker and Sutton's 5 per cent. solution for pre-operative skin disinfection. Professor Fleming's opposition to some of the claims made on behalf of acriflavine is well known, and there is much force in his argument that appropriate experiment should expose leucocytes to the action of acriflavine for a longer period of time. In a study of acridine compounds which has recently been made in this laboratory my colleague, Dr. A. E. Francis, has studied their effect on the motility of leucocytes by direct observation during periods up to one and a half hours, and activity persists in 1 in 2,000 solutions of acriflavine and proflavine throughout this time; the spectacle presented by these leucocytes, stained a bright yellow but nevertheless actively motile, would astonish any sceptic. Since weaker solutions of such compounds are bactericidal under similar conditions and within the same time limits, it is true to say that these substances are more lethal to streptococci than to the cells of mammalian tissues.

Acridine has the disadvantage, not referred to in the articles by Mr. Keynes and myself, of ill-defined composition. It is actually a mixture in variable proportions of 2:8 diaminoacridine hydrochloride and its methochloride, together with traces of by-products of the reaction of preparation, which appears to increase solubility. It is possible that experimental results less favourable than those which I have just described have been obtained with unsatisfactory samples, and that divergent opinions on the merits of acriflavine are justified by differences in composition and action. Good acriflavine is the best antiseptic of its kind now obtainable, and it is justifiable to hope that bad samples are not nowadays produced, but the position is admittedly unsatisfactory. A paper by W. H. Linnell, A. Albert, A. E. Francis, and myself, which is shortly to appear, records

CHILD GUIDANCE

At a meeting of the Sheffield and District Association of the Medical Women's Federation on January 29 Dr. F. J. S. ESHER, medical director of the Sheffield Child Guidance Clinic, gave a lecture on child guidance.

Dr. Esher said that child guidance was a scientific subject based on interpreting certain observations of the relationship between children and parents. Intelligence was a physically determined aspect of mind and depended on the number, complexity, and arrangement of nerve cells. An index of the degree of intelligence could be obtained by testing and was unalterable except for the worse. Mental stability might also be a physically determined aspect of mind, but emotional development or personality was mainly dependent on the psychological environment. Environmental factors might cause a child to become a "problem child" where, for example, there was loss of security in a home broken by discord, death, changes of abode or changes of income; lack of opportunity for mental growth; and, perhaps most important of all, the failure of parents to adopt the right attitude in training a child. Treatment undertaken at the child guidance clinics involved testing of the intelligence by a psychologist, examination of the emotional reactions by a psychiatrist, and certain social investigations which were made by social workers. Conditions of which complaint was commonly made were fears and anxieties, excessive fantasy, emotional instability, nervousness, inferiority feelings, enuresis, neurotic illnesses such as asthma and migraine, delinquency, educational difficulties, and stammering. Dr. Esher concluded by saying that ideally there should never be a problem child. This ideal state would only be brought about by dissemination of the knowledge gained about the mental life of the child in relation to his parents, teachers, and others.

At a meeting of the Section of Pathology of the Royal Academy of Medicine in Ireland on January 21, with the president, Dr. G. C. DOCKERAY, in the chair, four short communications were presented. Dr. W. R. F. COLLIS read notes on a case of congenital haemolytic anaemia, Professor J. McGRATH described a case of leuco-erythroblastic anaemia, Dr. J. A. WALLACE discussed a case of mediastinal tumour, and Mr. A. B. CLERY showed four specimens of meningeal tumours, outlining the histories of the patients concerned and describing the operations performed in each case. Among those who took part in the discussion which followed each paper were the President of the Academy, Dr. A. R. Parsons, Mr. A. A. McConnell, Drs. J. C. Flood, R. E. Steen, E. Harvey, and T. A. Bouchier-Hayes.

At a joint meeting of the Society of Public Analysts and Other Analytical Chemists with the Food Group of the Society of Chemical Industry, on February 2, Dr. A. C. FRAZER read a paper on fat absorption and metabolism, in which he presented evidence that passage of fats through the walls of the small intestine could take place without hydrolysis to fatty acids and glycerol. In cats such hydrolysis could not occur, for there was no lipase in the intestines. In human beings lipase was present, and part of the fats ingested penetrated the intestinal walls as fatty acids, but a large proportion penetrated unchanged. The fatty acid portion passed to the fat depot by way of the portal vein, liver, and hepatic vein, but the unhydrolysed fat avoided the liver and passed to the fat depot by way of the lacteal lymphatics and the systemic vessels. The presence of particles of unhydrolysed fat in the blood was detected microscopically by use of dark-ground illumination, and this means was used to study variations in the concentration of the fat particles in the blood in course of digestion.

ENGLAND AND WALES

Liverpool Cancer Inquiry

A commission of leading Liverpool medical men, scientists, and representatives of hospitals has been authorized to report on the work which is being done in the district in the investigation and treatment of cancer, and on possible extensions and improvements. The inquiry was set up on the initiative of Lord Derby, Chancellor of the University of Liverpool, who consulted with the Associated Voluntary Hospitals Board. The members of the commission are Professor Arnold D. McNair, LL.D., Vice-Chancellor of the University (chairman), Professor R. E. Kelly, M.D., F.R.C.S., Professor Henry Cohen, M.D., F.R.C.P., Professor James Chadwick, F.R.S., Professor A. Leyland Robinson, M.D., F.R.C.S., and Mr. Rowland H. Thornton, chairman of the Associated Voluntary Hospitals Board. The secretary is Mr. A. V. J. Hinds, 641, India Buildings, Water Street, Liverpool. The commission's terms of reference are to examine and report on the work being done in the Liverpool area in connexion with the treatment of cancer and the investigation in all its aspects of the cancer problem; to examine and report on methods of extending and if possible improving this work in the Liverpool area and of giving maximum effect to all the scientific, clinical, and financial resources available therein for these purposes, with particular reference to (1) the best use, consistent with the welfare of patients, of the hospital accommodation and research facilities available in the voluntary and municipal hospitals in the Liverpool area, and in particular in the Radium Institute and the Hospital for Cancer; (2) the most promising lines of investigation in regard to cancer, its causes and treatment, capable of being pursued in the area; (3) the feasibility of co-ordinating the various activities involved, whether by bringing these under some unifying board or authority or by some other method.

New Clinic for Chronic Rheumatic Disease

On February 2 the new clinic which has just been formed for the treatment of chronic rheumatic diseases at the West London Hospital was officially opened. The physician-in-charge, Dr. W. S. C. Copeman, showed a film of his own making illustrating the differential diagnosis of rheumatoid arthritis and osteo-arthritis. Among those present were Sir Frank Fox, organizing secretary of the Empire Rheumatism Council, the chairman of the Public Health Committee of the Royal Borough of Kensington, Dr. James Fenton, M.O.H. for Kensington, and Dr. J. B. Howell, M.O.H. for Hammersmith. Before showing the film Dr. Copeman drew attention to the importance of chronic rheumatism as an industrial disease, and expressed his belief that the West London Hospital was the first general hospital in London, if not in the British Isles, to start a special department for the treatment and investigation of these diseases. At the conclusion of the lecture the Dean of the Medical School, Dr. Maurice Shaw, congratulated Dr. Copeman on the excellence of his film, and expressed the general satisfaction of the staff of the hospital in the foresight of the Board of Management in providing the new clinic. Dr. James Fenton stressed the need for research into the rheumatic diseases, and hoped that this aspect would not be lost sight of in the new clinic. A clearer understanding of the aetiology would lead to more effective preventive treatment. Dr. Howell also congratulated the hospital on its new venture, and promised the sympathetic support of the public health authorities of the Borough of Hammersmith.

supervised, and presumably the results are reported to the medical officer of health. Presumably, also, these results are incorporated in his annual report, of which three copies are sent to the Minister of Health. Moreover, in the city of London, and probably in other large cities, all slaughtering is supervised by two whole-time qualified veterinary inspectors. Is there any difficulty in asking for a return of the number of carcasses inspected and the number found to be tuberculous? The answer is in the negative.

The Cattle Diseases Committee of the Economic Advisory Council, which was appointed in November, 1932, and whose report was published in May, 1934, stated as follows concerning the incidence of bovine tuberculosis among cattle (para. 29 of the report):

"The incidence of bovine tuberculosis among cattle is probably as high in Great Britain as anywhere else in the world. A number of witnesses before us have expressed the view that 40 per cent. of the cattle in this country are infected with it in such degree that they will react to the tuberculin test. This estimate is based first upon the percentage infection found in herds tested with tuberculin for the first time, and, secondly, upon the results of the inspection of carcasses of cows slaughtered. For example, the results of tests in 144 herds which had not previously been tested for tuberculosis were quoted in various memoranda submitted to us, and showed that of 5,199 cows, 2,233; or 43 per cent., gave a 'positive' reaction. It was also recorded in a report drawn up by the People's League of Health that 39.5 per cent. of 55,318 cows slaughtered at various centres were found on post-mortem to be infected. In considering this latter percentage it must be remembered that many cows which are infected with tuberculosis do not reach the slaughter-house, as they die upon the farm, or are sent to kennels or knackers. It may therefore be unduly low. In the light of such figures as these the generally accepted conclusion that at least 40 per cent. of cows in dairy herds are infected with tuberculosis does not appear exaggerated. This percentage of infection may be compared with the percentage of something over 4 in the United States, and of approximately 12 in Canada, before steps were taken against the disease. We have no evidence to show whether the disease is increasing or diminishing in Great Britain, but the widespread neglect of adequate precautions against its increase makes the latter improbable."

It is a sad reflection on our complacency and apathy that Great Britain in this aspect of public health should lag so far behind a smaller and poorer country, and that the incidence of bovine tuberculosis in England and Wales should be two thousand times greater than in Finland. To make things worse our Milk Marketing Board, the most friendless body in Britain, has put a levy on the milk from tuberculin-tested herds. The owners of these herds are allowed to sell milk for one-third more than the price of milk from non-tested herds. Nevertheless, there will be a reduction in the number of tuberculin-tested herds, and consequently a reduction in the amount of tubercle-free milk available for the public. When the Milk Scheme was introduced all milk producers—good, bad, and indifferent—were lumped together and paid the same levy. The good producer who spent more on milk production than the bad producer would have been crippled; if not ruined, by the levy. To escape from the clutches of the Milk Board the good producer sold his herd and bought tuberculin-tested animals which cost double as much as untested cows. Yet being outside the jurisdiction of the Milk Board he was able to sell his milk at a remunerative price, and in point of fact the number of tuberculin-tested herds was doubled. I know of two owners who have ceased to use the tuberculin test since the levy was introduced.

The Milk Marketing Board is a mystery and a sign. The producer must sell whole milk for 2s. a gallon, but he may sell skimmed milk to food manufacturers for 3½d. a gallon. Again, milk sold for its cream costs more than

milk sold for making butter, although a child could tell you that butter is made from cream. Hence we have reached the Gilbertian situation where it is more economical for a consumer of cream to buy butter together with a machine for turning the butter back into cream. It reads like *Alice in Wonderland*, or rather in *Dementia*. I am not an economist, and am beginning to wonder whether such people exist.—I am, etc.,

London, W.8. Feb. 3.

HALLIDAY SUTHERLAND.

Tuberculosis in Infants

SIR,—The prevention, diagnosis, and treatment of intrathoracic tuberculosis in infancy is one of the most difficult problems we have to face. Dr. Dorothy Price's excellent paper on tuberculosis in infants (*Journal*, February 5, p. 275) will help to correct certain common misconceptions to which she refers and emphasize important points in prognosis and treatment. It might be argued that her diagnostic standards were not strict enough, and I for one would wish her to include, in paragraph 3 of her summary, examination of the expectoration (obtained by tickling the throat or by gastric lavage) for the tubercle bacillus either directly or, if this is negative, by guinea-pig injection. Exact diagnosis is particularly important, because it helps the tuberculosis officers to find unsuspected "open" cases of phthisis in adults, and, as Dr. Price emphasizes, one of our most important tasks is to remove infants from their dangerous environment whenever we can and at the earliest possible moment. It would, of course, be more economical to remove the infected adult from the home—in the American phrase to "make every home a preventorium"—but for various reasons this is often impossible at present.

My own investigations—a summary of which will shortly appear in *Acta Paediatrica*—have convinced me that:

1. Primary intrathoracic tuberculous infection is fairly common in infancy, and is frequently undiagnosed—masquerading as bronchitis, pneumonia, debility, "marasmus," gastro-enteritis, etc.—unless the tests advocated by Dr. Price and supplemented by a search for the tubercle bacillus are extensively applied to ailing babies.

2. Such infection is always a potentially dangerous illness, but the mortality rate is not high if infants can be removed early from the source of infection. (Dr. Price's series gave a high mortality rate because so many of her cases had gone beyond the primary stage when they came under her care.)

3. The correct and early diagnosis of primary tuberculosis in infants constitutes one of the most important means we have for attacking the tuberculosis problem in general.—I am, etc.,

Liverpool, Feb. 6.

NORMAN B. CAPON.

Trauma and Progressive Muscular Atrophy

SIR,—In his interesting review (*Journal*, January 29, p. 225) Dr. G. E. Frederick Sutton puts forward the view that trauma may sometimes be a factor in the production of progressive muscular atrophy. It may be of interest to mention three cases, of a somewhat different kind, which perhaps throw a light on the nature of the influences at work.

During a large epidemic of acute anterior poliomyelitis I saw three instances of children suffering from fractures who developed poliomyelitis while the fractured limb was still in splints. In each of the three cases there was a widespread paresis, which cleared up almost completely

an attempt to identify a single acridine compound (as distinct from a mixture) which is at least equal in merit to acriflavine, and although this work has not yet fully attained its aim it is likely that in time to come uniformity of effect in antiseptics of this kind will be secured.

May I at the same time refer to Dr. Corfield's suggestion that chloroform should be used instead of spirit for sterilization of instruments? This may be a useful method from some points of view, but the accompanying statement that chloroform will kill spores requires emphatic contradiction. It was found as long ago as 1881 by Koch that chloroform would not kill anthrax spores in 100 days, and subsequent experiments by many others have had similar results. I can vouch from personal experience for the fact that chloroform does not kill the spores either of *B. subtilis* or of *Cl. tetani*.—I am, etc.,

St. Bartholomew's Hospital,

LAWRENCE P. GARROD.

Oxygen Want and Oxygen Therapy

SIR.—Your leading article on this subject contains a statement in regard to the mortality from pneumonia which requires explanation or correction. You state that among 46,000 cases of pneumonia in England and Wales in 1936 there were 30,000 deaths, and contrast these figures unfavourably with those in the United States.

It has long been recognized that the mortality of lobar pneumonia in the United States is, for various reasons, considerably higher than in this country. The usual mortality figure for lobar pneumonia in large hospitals in England, including all age groups, is given as approximately 20 per cent., and it is generally held that the mortality in practice is considerably lower. Full references to mortality figures were recently given by Davies, Graham Hodgson, and Whitby (*Lancet*, 1935, 1, 791). Your figures suggest a mortality of 65 per cent., or double the higher hospital figures in the United States, or, so far as I know, in any European country. You give no indication, however, as to whether your figures are concerned with lobar (pneumococcal) pneumonia only, or with all types. No allowance is apparently made for discrepancies due to the fact that, although pneumonia is now notifiable, we have no reliable evidence as to the actual proportion of cases notified.

Finally, the article seems to imply that the more favourable [*sic*] figures in the United States may be partly due to a more extensive or efficient employment of oxygen therapy. This would be very difficult to substantiate even were it accepted that the American mortality rate is lower than ours. It must be remembered that serum therapy is extensively employed in the United States because of the high mortality figures there, and that it has not as yet been employed on a wide scale in England.—I am, etc.,

Cambridge, Feb. 5.

JOHN A. RYLE.

* The figures were obtained from the Annual Report (1936, p. 17) to the Minister of Health. The cases include, however, only those that are notifiable; but the deaths tabulated under acute primary and acute influenzal pneumonia (31,067 in all) include also deaths from bronchopneumonia and "pneumonia not otherwise defined," as stated in a footnote. In the leading article the word "notified" should have been inserted between "46,000" and "cases." That early treatment with oxygen is of value in preventing and lessening complications was demonstrated by Dr. Hathaway and colleagues (*Anaesthesia and Analgesia*, 1937, 16, 89), also by Drs. Evans and Durshodwe (*ibid.*, 1932, 11, 193).

The Danger of the Stercolith

SIR.—Mr. A. M. Spencer in the *Journal* of January 29 (p. 227) stresses the importance of the stercolith in the aetiology of acute appendicitis; undoubtedly its presence, acting as a nidus of infection and as an obstruction to drainage, is responsible for a virulent and acute type of the disease that is apt to be particularly dangerous. Perforation of the appendix wall and release of the stercolith into the abscess cavity is frequently found in late cases, and careful search for and removal of the stercolith should be made as far as circumstances permit. Failure to achieve this may be responsible for prolonged suppuration, either immediate or delayed, as in a recent case under my care.

In 1925 a child of 24 years was operated on for acute appendicitis; as the patient was extremely ill no prolonged search was made for the stercolith which, it was noted, had probably been present. Healing occurred satisfactorily, and nothing further was noticed until, as a boy of 14, the patient was again seen in 1937 for abdominal pain and tenderness in the right iliac fossa. A few days later a lump appeared, and from this pus was evacuated. While this was being done the stercolith which was suspected as the cause of the residual infection was felt momentarily in the depths of the abscess cavity, but escaped before it could be removed and could not be identified again. Prolonged suppuration followed in the pelvis and lower abdomen, and the boy became extremely emaciated and ill, until, happily, at the end of three months a small stercolith of almost metallic hardness delivered itself from a sinus, and suppuration ceased almost immediately.

Apart from such an unusual occurrence, one may envisage the possibility of mild chronic sepsis occurring round a retained stercolith producing very baffling symptoms in a case in which the appendix was known to have been removed and such a contingency overlooked.—I am, etc.,

Birmingham, Jan. 29.

SEYMOUR BARLING.

Bovine Tuberculosis in Britain

SIR.—During a recent visit to Finland I learnt that over two million cows in that country have been tested with tuberculin during the past forty years. In the early years of testing cattle a positive reaction to tuberculin was obtained in as many as 26 per cent. of the animals. Many of these were slaughtered and found to be obviously diseased. In this aspect of public health Finland is now unique in Europe. In the State-controlled abattoirs only 0.02 per cent. of cows slaughtered are found to be tuberculous, as against 50 per cent. in Sweden and at least 40 per cent. in England and Wales.

The facts about bovine tuberculosis in Finland led me to seek information from the Ministry of Health as to the percentage of cows found to be tuberculous when slaughtered (a) in municipal abattoirs and (b) in private abattoirs in England and Wales. The reply was as follows:

"I am directed by the Minister of Health to say that he regrets that the information you seek is not available, and the Minister is not aware of any source from which it could be obtained at present."

In view of that reply it is a pleasure to enlighten the Minister as to the sources from which the information could be obtained. All abattoirs, municipal and private, are open to sanitary or veterinary inspectors. All owners of private abattoirs must give statutory notice to the local medical officer of health before animals are slaughtered. In a large rural area with only one sanitary or veterinary inspector it would be impossible to supervise all slaughtering. Nevertheless the slaughter of some animals is

through intramural tension; and, thirdly, that he might investigate thoroughly the bacteriology of the acute fulminating appendicitis which is so often fatal, particularly with reference to the leucocytic response and the value of the sulphanilamide group of drugs in its treatment. It is generally admitted that the diet of the white races plays a large part in their marked predisposition to the disease, and the extreme prevalence of appendicitis in the U.S.A. suggests that canned and preserved foods may be largely responsible for this increased frequency. This last point also seems worthy of further investigation. The results of such investigations made over a large series of cases—500 to 1,000—could not fail to be of great clinical value.—I am, etc.,

Glasgow, Feb. 5. A. JAN L. MATTLAND, F.R.C.S.Ed.

Throat Carriers in Midwifery Practice

SIR.—The "generous spirit" that recognizes in Professor Miles H. Phillips's dictum, "every woman is pregnant until you have proved that she is not," a pearl of wisdom when applied to bacteriology finds that "what you lose on the swings you gain on the swabs." It is therefore a matter of interest and importance to estimate what the profession has gained on the swabs. The swabs have revealed to us, among other things, that the streptococcus is a most protean and omnipresent organism. The type lethal to man is found in every possible situation except one—the vagina. It refuses absolutely to inhabit the vagina until it can clearly prove that it has been put there by the carelessness of the medical attendant. I know of no other organism that displays this lethal and malicious combination of characteristics. The favourite habitat of this Group A streptococcus is the nose and throat of every third or fourth person in existence. It shows such a tendency to inhabit the vagina of the parturient—when the attendant can be convicted—that it is almost impossible to keep it from doing so.

The remedies suggested are, among others, that the nose and throat of the patient and every possible contact should be swabbed *two days before the patient goes into labour*. With a certain Royal example recently before us, it is pertinent to ask how often these suffering people would require to have their throats swabbed. The swab must be taken and cultured by experts, otherwise the results are not to be depended on. If a swab is negative no importance is to be attached to it. If positive the swabs have to be kept for six months in case of legal action. They have to be witnessed and certified by disinterested responsible persons, who no doubt in their turn would require to be swabbed and masked. Similarly, two days before labour sets in everyone in the immediate environment of the patient must be constantly masked, as must the patient herself. The same masks must not be worn for any length of time because they lose their pristine sterility and become in their turn lethal agents. To be absolutely reassured against legal consequence we must also have swabs taken to prove that the masks were sterile, and if the masks were sterile the swab would thus be negative, and the bacteriologist says these negative swabs have to be disregarded. We must thus go on swabbing at the sterile mask until we get a positive culture, and that positive culture must also be kept for six months. To show the resulting reaction by the parturient if these bacteriological safeguards are not employed we have only to conjure up a picture of the postman with septic tonsils coughing upon letters congratulating the young primipara on the successful conclusion of her first adventure. The letters would be taken straight to the patient with

disastrous bacteriological results. The nurse who carried the correspondence to the patient would become similarly infected, and upon the swabs being taken would be blamed for the septic consequences to the patient. The doctor and nurse in the future must be content to have their antra operated on, tonsillectomy performed, etc., though no one with a knowledge of the end-results of these operations would seek to maintain that they were cures for streptococcal infection. I need not enlarge these points further, but will end by asking again—What have we gained on the swabs?—I am, etc.,

Glasgow, Feb. 4.

JAMES COOK.

Cauterization of the Cervix

SIR.—I should like to add my congratulations to those of others on Professor James Young's able and enlightening publication on lower abdominal pains of cervical origin in the *Journal* of January 15 (p. 105). The amount of disability resulting from chronic septic infection of the cervix uteri is not sufficiently recognized, and it is a good thing to call attention to it from time to time because the condition has been overlooked in so many women who come to the gynaecologist after having found no relief from removal of the appendix. It is to one of the methods of cure that I wish to call attention.

Thorough cauterization is often advised and referred to as a simple and harmless measure. I have recently seen three most distressing results of this procedure. One case was that of a young woman who developed increasingly severe dysmenorrhoea after cauterization. All that remained of the cervix was a hard indurated knob of dense scar tissue or keloid through which the smallest dilator would pass with difficulty; dilatation of the canal was impossible. How is such a patient to be relieved? The other two cases are more or less the same but less severe. Both have hard cicatrized tissue preventing the natural softening and dilatation of the canal, and have developed dysmenorrhoea since cauterization. The essential practical features of the cervix are its elasticity and dilatability. The scar of a burn is a permanent deformity which the obstetrically minded do not like in the cervix, apart from the occasional results seen from over-thorough cauterization.

I think there are objections to producing burn scars as a surgical procedure. I find that the clinical results of disinfecting the glands of the cervical canal as much as possible, coupled with curetting and excising badly infected portions and retention cysts, and with amputation of the cervix for the more severe cases, are satisfactory. So far I have not seen constrictions of the canal and dysmenorrhoea resulting. My warning is not to those who understand the correct degree of heat to use and how to apply it, but to those who would give it "a thorough good cauterizing"—and do. Is my experience exceptional?—I am, etc.,

E. LAWTON MOSS, F.C.O.G., M.R.C.S.

London, W.1, Jan. 30.

Methods of Pelvimetry

SIR.—The important conclusion arrived at by Mr. J. Howkins in his paper published in the *Journal* of February 5 (p. 278) on the unreliability of the clinical measurements of the true conjugate is another argument in favour of x-ray pelvimetry. This can now be carried out with any standard radiographic plant and is sufficiently accurate for clinical purposes, as the possible error in a properly carried out x-ray pelvimetry does not exceed 4 to 5 mm. I have been using Thoms's method for a number of years.

except in the fractured limb, which remained severely and permanently paralysed. For example, in a case of fracture of the bones of the forearm the final result in the uninjured limb showed a paralysis of only the opponens pollicis and triceps, while the whole of the fractured limb was the subject of permanent and almost complete paralysis, which included even the deltoid. I described these three cases at a professional meeting, and in the subsequent discussion it transpired that two of the members present had seen cases precisely comparable. In these children it appears probable that the trauma had the effect of opening the door to an acute anterior poliomyelitis, with a segmental distribution corresponding to the site of the injury. The pathological process is at present obscure, but it may perhaps represent the acute phase of the chronic process described by Dr. Sutton.—I am, etc.,

R. G. ABERCROMBIE.

Edgar Allen Institute, Sheffield, Feb. 3.

SIR,—I was greatly interested in Dr. G. E. F. Sutton's account of the association between trauma and progressive muscular atrophy. During 1937 I was consulted four times in respect of this problem. On each occasion I gave those seeking my advice the following information. (a) There is a sharp conflict of opinion, as reflected in medical textbooks, on this subject. The best example of this conflict is seen in the difference between the second and the fourth editions of Price's *Textbook of Medicine*. (b) It is incredible that slight jarring or jolting should be the cause of progressive muscular atrophy; for if it were so the disease would be exceedingly common instead of very rare. (c) On the other hand, many patients give an impressive chronological account pointing to the probability that in certain cases trauma may hasten or precipitate the onset of the disease. (d) It may well be that in certain cases the accident is the result of clumsiness in the very early stages of the disease. (e) The disease may be closely mimicked by other maladies, some of which are certainly traumatic in origin. (f) The original descriptions of the malady by Duchenne and others make little or no mention of trauma.

I thought it might interest your readers to know how these views have appealed to jurists. Two of my cases are still unsettled. In one case compensation has been refused point-blank, and I have advised that appeal will be useless. In a fourth case the employers paid to the estate of the injured workman the sum of £500. A learned and very experienced county court judge consented to this settlement.—I am, etc.,

Sunderland, Feb. 3.

G. F. WALKER, M.D., M.R.C.P.

SIR.—The association of trauma with progressive muscular atrophy was discussed in an article by Dr. G. E. Frederick Sutton in the *Journal* of January 29 (p. 225), and I am prompted to add the following case report to the somewhat scanty literature on the subject.

A retired business man, aged 62, sprained his right ankle while playing golf in September, 1935. In December of the same year he complained of numbness and weakness of the right foot and leg, which he attributed to the recent accident. A month later, in January, 1936, the question of progressive muscular atrophy was raised, and by April of that year the diagnosis was established. In October atrophy of all the muscles below the knee was demonstrable, but the patient was able to walk and to drive his car with safety. A year later, in October, 1937, he was still driving, but was unable to walk without the help of a stick, and could not balance himself unassisted when standing. He further complained of

weakness and cramp of the muscles of the left thumb, being unable to hold his razor in that hand. The following month the loss of power in the left arm interfered with gear-changing while driving, and weakness of the left foot was first noticed. A month later the trouble spread to the right hand, and at the time of writing there is pronounced general weakness of all four limbs. The patient's condition is complicated by urethral stricture and multiple urinary calculi. The Wassermann reaction is negative.

The question arises as to the relation between the slight injury to the foot and the onset of the disease a few months later. *Post hoc ergo propter hoc* may be fallacious reasoning in this case, and the accident to the foot may have been the first sign of muscular imbalance. The patient himself insists that his foot was perfectly sound before the accident, and that it has never been the same since. He unhesitatingly attributes his disability to that occurrence. But it is a well-recognized fact that any patient suffering from a defect—be it physical, mental, or moral—seeks an external cause rather than admit in himself an internal source of disease. Every woman with mammary carcinoma believes her condition to be due to a blow upon the breast.

I report this case for what it is worth. While some may consider it as a further instance of trauma precipitating the onset of progressive muscular atrophy, I am inclined to look upon the relationship as accidental. Having regard to the large number of injuries and the few cases of progressive muscular atrophy, it is by no means certain that the cases hitherto reported cannot equally well be explained as mere coincidences. In the absence of any better theory than "ascending neuritis" or "molecular disturbance of the cord" I prefer to retain an open mind on the subject.—I am, etc.,

Hayle, Cornwall, Jan. 31.

Acute Appendicitis

SIR.—After reading Dr. A. M. Spencer's article in the issue of January 29 (p. 227) on the aetiology of acute appendicitis, I feel that two criticisms of it must be raised. The first of these is this—that during the years up to 1900 (*circa*) appendicitis was frequently labelled in error typhilitis, perityphilitis, or simply peritonitis of unknown origin, and therefore these diseases should be included in any survey designed to determine its frequency prior to that date. The second is that it is fallacious to base statistical conclusions on any series of cases which is not considerably larger than that used in this article. Let me illustrate the point by an example showing the possible error even in a fairly large series and extracting only one simple fact. During 1936, 319 cases of catarrhal appendicitis were operated on in the Western Infirmary, Glasgow, with three deaths, giving a mortality rate for the year of slightly under 1 per cent. If this series of cases is arranged chronologically and split into two groups of 160 and 159 respectively, it is found that the former contains no deaths, while the latter contains all three and thus acquires a high mortality rate of slightly under 2 per cent.

Since the only justification for destructive criticism is the emission of constructive suggestion from the same source, let me make the following suggestions to Dr. Spencer for his future use in the study of this subject. I would suggest first of all that he makes an endeavour to correlate the organisms of the sore throat—when present—with those in the inflamed appendix; secondly, that he differentiates between the appendix kinked over an adhesion with distal inflammation and that coiled on itself

the school shoe, with its broad flat heel, to the high heel and pointed toe. True, she may be able to get a brogue shoe with flat heel for outdoor country wear, but indoor shoes, slippers, afternoon and dancing shoes are all of the so-called fashionable, pointed, high-heeled variety. Of course shoes can be made individually for the wearer, but they are expensive, especially when she requires to have a number suitable for wearing with different frocks. The typist, shop girl, secretary, etc., cannot afford this, and therefore has to take what the manufacturer offers. I have had the opportunity of speaking to several manufacturers and they maintain these extravagant shapes are what the public demand. Yet I am continually getting complaints from mothers and daughters of the impossibility of getting correct shoe wear. The retail shoe provider makes a great show with his x-ray apparatus, and he has shoes with innumerable varieties of patent arch- and toe-supports, which may or may not assist in correcting the deformities which they in the main have previously produced. X-ray films taken with the patient wearing high-heeled shoes show that only half the upper articular surface of the talus is engaged, the anterior portion of the articulation having nothing to work on.

Is it not time for the medical profession to urge from a national health point of view that the shoe manufacturers provide a shoe on real anatomical lines?—I am, etc.,

Harrogate, Feb. 2.

G. L. KERR PRINGLE.

Technique of Blood Transfusion

SIR,—From personal experience of receiving blood transfusions I should like to mention one or two relevant points which I think could with advantage be emphasized.

First, and of paramount importance, is the rate of transfusion. Dr. H. F. Brewer in his excellent article (*Journal*, January 29, p. 241) suggests that a pint in half an hour is a reasonable rate. May I make a plea that this be regarded as the maximum rate, and that on occasions this time should deliberately be exceeded? Blood transfusion is a procedure that may so easily and unconsciously be hurried. Patience on the part of the operator will add greatly to the comfort of the patient, and may often avoid some of the unpleasant catastrophes that occasionally occur. Transfusion by the clock—not against it—will be helpful in developing this necessary virtue. At the same time the temperature of the blood should be kept as near to the ideal as possible, a point to be watched when the transfusion is given slowly.

Secondly, in transfusing patients with severe infections the quantity of blood should be rather on the low side. This type of patient usually develops a severe delayed reaction, probably of a non-specific protein character. This reaction very often has a beneficial effect on the course of the infection, and one which I believe is of more importance than the actual increase in haemoglobin to the patient, but it may easily become too violent. Little and often is, I think, good practice to follow in these cases.

Finally, with regard to the amount of citrate added. That suggested by Dr. Brewer—0.3 gramme for every 100 c.cm. of blood—may comfortably and safely be used, but I think it is easy to be too lavish with the citrate in order "to be on the safe side." I believe that a good many of the unpleasant sensory symptoms experienced in the course of transfusions are due to the temporary alkalosis induced by the citrate. Where excessive quantities are used the symptoms of tetany that may occur, though of short duration, may be quite alarming. As the

action of the citrate appears to be rapidly dealt with and adjusted in the body, emphasis on the slowness of transfusion will also help to reduce the occurrence of these symptoms.—I am, etc.,

RECIPIENT.

The Radiologist's Range of Service

SIR,—In the *Journal* of February 5 (p. 310) Mr. H. Osmond Clarke criticizes Dr. C. H. C. Dalton's letter (January 22, p. 206). May I, as a radiologist of forty-two years' experience, criticize Mr. Clarke's view of the duties and restricted range of service of the radiologist? A radiologist is not a mere technician, but is now recognized as a "medical physician who specializes in radiology." In almost all reputable hospitals the radiologist constantly confers and consults with any or all of his surgical, medical, and other colleagues, and they decide together what is best to be done for the patient according to their combined findings. It has also been my custom to confer or consult with other medical men who have in private sent cases to me, with the happiest results to all concerned. Medical knowledge and treatment must be considered as a whole; it cannot be bound down and pigeon-holed into specialized compartments without injury to our patients.—I am, etc.,

South-Eastern Hospital for Children, GEORGE B. BATTEN.
Sydenham, Feb. 6.

The Problem of the Final M.B., B.S.Lond.

SIR,—May I crave a little more of your space to add a few words to my previous letter?

I have read again the letters that have been published on this subject, and the reading of them has left my mind in a whirl. The writers, for the most part, are practised controversialists and politicians—not statesmen—and there is some truth in the gibe of Dr. Gray that "Sir Ernest and his friends appear to take no interest in the student or in his educational career." My sympathies are entirely with the student (and with his parents). I submit that the students are to a very large extent the University, it cannot exist without them; and that therefore the policy of the University should confine itself to them and take no account of the Royal Colleges.

But my chief reason for writing is to draw attention to an amazing statement made by Sir Ernest Graham-Little in his last letter. He writes that at a full meeting of the subcommittee of the Faculty Board the suggestion that the examination should be held four times a year was turned down because "this action would constitute 'competition' with the Colleges." Could there be stronger evidence of the medical side of the University being, so to speak, in the pocket of the Colleges, or stronger evidence of the strength of their following on the Faculty Board? Surely London University is important enough and strong enough to act alone.—I am, etc.,

Mayfield, Sussex, Feb. 7.

STANLEY COLYER.

J. C. Mauury (*Thèses Nancy*, 1936-7, No. 12), who records seventeen cases, in patients aged from 3 to 18, maintains that there is a special form of purpura which occurs in connexion with scarlet fever; he calls it post-scarlatinal purpura fulminans. The condition appears to be most prevalent in the Anglo-Saxon race, ten of the seventeen cases being English and four American. Sudden aggravation of the symptoms and the accompanying pain are characteristic. Fifteen of the seventeen patients died. The author considers the condition an example of the haemorrhagic allergy described by Sanarelli and Schwartzman.

and have had the opportunity of comparing the results of the x-ray pelvimetry by this method with direct pelvic measurements carried out in patients who have subsequently undergone a laparotomy. The error found was very small, and could be accounted for by the thickness of the soft parts.

X-ray pelvimetry can be carried out even in advanced pregnancy. It brings an element of reassurance to both patient and practitioner in normal cases, and gives a true picture of the brim in contracted pelvis.—I am, etc.,

London, W.1, Feb. 5.

A. ORLEY.

Contraceptives and Fertility

SIR,—In your issue of January 22 Mr. Green-Armytage is reported as saying at a meeting of the West London Medico-Chirurgical Society on January 7 that he "was convinced that contraceptive measures in the early days of marriage were inimical to pregnancy at a later date." I have been instructed by the Medical Subcommittee of the National Birth Control Association to draw the attention of your readers to the fact that there appears to be no medical evidence whatever to corroborate this statement. Records which have been carefully kept at clinics go to show that in many thousands of instances fertility has been in no way impaired by the use of contraceptive measures in early married life. The Medical Subcommittee will be glad to provide further information on this important subject if any of your readers are interested.—I am, etc.,

M. A. PYKE.

Control Association.

Temporary Sterilization by X Rays

SIR,—In your report of the meeting of the Sections of Radiology and of Obstetrics of the Royal Society of Medicine in the *Journal* of January 29 (p. 248) Dr. J. F. Bromley is quoted as having said: "Temporary sterilization in a young patient could be obtained without difficulty by x rays, and did not in any way preclude a later possibility of normal conception and the birth of healthy children." If this is so, have we not here a better means of contraceptive practice than either Graafenburg rings which fall out or occlusive pessaries which ladies forget to put in?—I am, etc.,

Droitwich, Jan. 31.

E. SHIRLEY JONES.

Coughing in Public

SIR,—Is it not time that the public was educated in the matter of the spread by droplet infection of the common cold and other diseases of the upper respiratory tract? Our public vehicles bear formidable notices, "No Spitting. Penalty £5"; surely space could be spared in them for the display of a few posters, preferably illustrated, on the lines of "Do Not Cough on your Neighbour, It is Dangerous" or "Protect your Neighbour from your Germs by Covering your Mouth when you Cough." A great amount of time is lost in industry owing to the common cold. It is useless to upbraid the medical profession for being unable to prevent this so long as colds are widely disseminated by a generous public coughing their infective organisms into the faces of their neighbours.

Unfortunately the medical profession itself has much to learn in this respect. At a medical meeting I attended recently about three-quarters of the audience coughed consistently throughout the proceedings and only a small

minority placed their hands before their mouths. As the temperature of the room was—as is usual at medical meetings—somewhere about 75° F. and ventilation was nil, the atmosphere formed a perfect incubator for the pathogenic organisms so freely distributed by the coughers.

Doubtless this matter is one for the public health authorities, but reference to it in the medical press may at least call attention to what is a serious, yet preventable, source of infection.—I am, etc.,

London, W.1, Feb. 3.

RUBY O. STERN.

Correct Footwear

SIR,—Public attention has at last been drawn to the absurdity of women's footwear, particularly to pointed shoes and the lack of a straight line from the extremity of the big toe to the inner side of the heel, resulting in the big toe becoming pressed outward and producing a prominence at the metatarsophalangeal joint, followed by inflamed bursa (bunion) and probably corns. Corns also are prone to occur on the dorsal surface of the little toe for the same reason. The want of a straight inside to a shoe is not the only cause of deformity. The high heel also contributes its quota. The main idea of the high heel is that it heightens the arch of the foot and gives an appearance of shortening. This appears to be the main reason why it is so fashionable. But, while apparently shortening the foot, it broadens the ankle. A most important point is that the platform on which the wearer's heel rests is not on the level but on an inclined plane. In consequence the foot is always slipping downwards and forwards, so that the weight of the body rests not on the os calcis but on the heads of the metatarsals, jamming the foot into the narrowest part of the shoe and flattening out the metatarsal arch. Callosities form on the soles of the feet and still further incapacitate the wearer.

After these high-heeled shoes have been worn for a time the small leather on the sole of the heel, which is about an inch square and often less, begins to wear down either at one side or on three sides, and the heel becomes uneven and sometimes conical. This is partly due to oscillation, for each time the wearer puts her foot down a certain amount of oscillation takes place as she corrects her balance, and as the heel gets still more worn the difficulty of correcting balance is increased. This want of balance is quite different from that experienced when learning to skate, as the heel is on the same level as the toes. With a high-heeled shoe the wearer's centre of gravity is thrown forward, and to compensate for this the knees must be bent, and to keep the body erect there is great strain on the anterior longitudinal and the ilio-lumbar ligaments, with resulting low backache pain, etc. The wearer becomes unable to walk far because of pain in her feet and in her back, does not get exercise, and suffers from indigestion and constipation as the result of a faulty pose. As she gets older there is the tendency to put on weight, with further strain on the knee-joints and feet, resulting in a villous arthritis of the knee-joints.

It is an everyday occurrence to see young women going about hobbling, with expressions indicating that they are in pain and trying to make the best of it. As they get older these women come to the spas with flat feet, chronic villous arthritis, and obesity. Can nothing be done to stop it? The manufacturers make a great song about looking after children's feet, and usually no fault can be found with the footwear provided for school children, but when a girl leaves school there is nothing for her but anatomical monstrosities; she has to go straight from

The death occurred suddenly in Perth on February 1 of Dr. CHARLES PARKER STEWART, who had been medical officer of health for Perth City for many years. Dr. Parker Stewart was born in 1870, and after a medical course at Edinburgh University graduated M.B., C.M.Ed. in 1893, taking the degree of B.Sc. in Public Health in the following year and that of M.D. in 1915. After a period of practice at Perth, during which he was assistant surgeon to Perth Royal Infirmary, he became medical officer of health for the city. He was superintendent of the Hospital for Infectious Diseases in Perth, and surgeon to Perth City Police. He had published various articles dealing with public health, including one on the supervision of small-pox contacts and several on the subject of infantile mortality. He had retired from the post of medical officer of health only the day before his death. Dr. Stewart was an active member of the British Medical Association, which he joined in 1898. He was treasurer of the Perth Branch in 1920-1, and in March, 1922, became secretary and treasurer of the Branch, a post he held until his death. He also acted as representative of the Branch at the Annual Representative Meetings in 1920, 1921, 1926, 1930, and 1935. "R. B." writes: Parker Stewart was unassuming, and while he had definite ideas of his own was always ready to listen to the opinions of others, hence the work of his department always went smoothly, and he carried his professional brethren with him. The great care of his life were children. He was never happier than at his child welfare centre, where besides dealing with them professionally he would sing to them, make drawings for them, and do conjuring tricks at which he was an expert. He was for over forty years a member of the B.M.A., and was for many years secretary to the local medical and panel committee. In this position also he carried out his duties with rare fidelity and tact, especially relative to the prescription subcommittee, where he would wade through thousands of prescriptions and tabulate them—a difficult job, in which his early pharmaceutical training stood him in good stead. He retired under the superannuation scheme on January 31 and died on his first day of retirement, to which, with his physical and mental powers unimpaired, he had not looked forward. The medical profession in Perth have lost a good and loyal friend, without cant or humbug, and one who was always ready to help in any good cause. He had no enemies. He is survived by a family of three sons, one of whom is in practice as a dentist in London. At the funeral service tribute was paid to his work: it was attended by civic and public bodies and every available medical practitioner in the area.

Dr. GERALD JOSEPH WALTON TIERNEY, who died recently in a Dublin nursing home at the age of 52, graduated M.B., B.Ch., B.A.O. of the Royal University of Ireland in 1908, and in 1912 became a Fellow of the Royal College of Surgeons in Ireland. Dr. Tierney had been for some years assistant gynaecologist to St. Vincent's Hospital, Dublin, external examiner in midwifery and gynaecology for the National University of Ireland, and examiner for the Central Midwives Board for Ireland. Before settling down in private practice he had worked at the Universitäts Frauenklinik in Berlin, and held the post of assistant master of the National Maternity Hospital, Dublin. Last year he travelled with the Irish National Pilgrimage to Lourdes as one of the chief medical advisers.

Dr. JOHN MATHESON, who died at Plockton, Ross-shire, on January 17, aged 81, had been a member of the British Medical Association for half a century, and practised for many years in Gibson Square, London, N. He had a distinguished student career at the University of Aberdeen, graduating M.A. in 1879, M.B., C.M. in 1883, and M.D. in 1886. During forty-five years of unbroken professional service in North London Dr. Matheson held many appointments, including that of honorary surgeon to the Royal Caledonian Schools at Bushey. He was president of the Caledonian Medical Society in 1922,

when it held its annual meeting in London. He had been a director of the Highland Society and a member of its bursary committee, president of the Gaelic Society, and was an original member of the Gaelic Service Committee. On his retirement from active work in 1930 Dr. Matheson returned to Scotland and made his home at Plockton in Lochalsh, in the old family house which he had never given up. He was a Justice of the Peace for the counties of London and Cromarty.

We regret to announce the death on January 28 at his home in Kennington Park Road of Dr. HENRY HARVEY NORTON, aged 73. Dr. Norton was a student of St. Mary's Hospital, and took the M.R.C.S. diploma in 1887 and the L.R.C.P. in 1888. Before settling down in general practice he served as house-surgeon and house-physician of St. Mary's Hospital, and later as house-surgeon at the Horton Infirmary, and contributed a note to the *British Medical Journal* on "Tracheotomy under Difficulties." He joined the British Medical Association in 1896 and was chairman of the Lambeth Division on two occasions—in 1924-5 and again in 1928-9. Among the appointments he held was that of surgeon to the Linen and Woollen Drapers' Institution.

The Services

PARKES MEMORIAL PRIZE, 1937

Major J. Biggam, M.C., R.A.M.C., has been awarded the Parkes Memorial Prize for 1937 for his very valuable investigations into the lighting of barracks and other military institutions coupled with important work he has carried out in regard to the effect on vision of the wearing of the service respirator and the designing of a suitable spectacle frame for wearing with the respirator by men with impaired vision. The prize is awarded annually to the officer who is considered by the committee to have done most to promote the advancement of naval or military hygiene by professional work of outstanding merit, and is open to medical officers of the Royal Navy, the Army, and the Indian Army, with the exception of the professors and assistant professors of the Royal Naval Medical College, Greenwich, and of the Royal Army Medical College, London, during their term of office.

NAVAL COMPASSIONATE FUND

At the quarterly meeting of the directors of the Naval Medical Compassionate Fund, held on January 21, Surgeon Vice-Admiral P. T. Nicholls, C.B., K.H.P., Medical Director-General of the Navy, in the chair, the sum of £96 10s. was distributed among the several applicants.

DEATHS IN THE SERVICES

Major ALEXANDER KEITH ROBB, R.A.M.C., died at Maymyo, Upper Burma, on December 3, 1937, aged 45. He was born on May 5, 1892, and was educated at Aberdeen, where he graduated M.B., Ch.B. in 1916. He entered the Royal Army Medical Corps as lieutenant in the Special Reserve on November 10, 1916, took a permanent commission as captain from March 4, 1920, and became major on September 4, 1928. Before he went to India he held the appointment of radiologist at the Royal Victoria Hospital, Netley. He served in the war of 1914-18.

Lieutenant-Colonel ROBERT HENRY BOTT, C.I.E., L.M.S. (rel.), died in a nursing home in London on January 21, aged 55. He was born on August 22, 1882, was educated at St. Bartholomew's Hospital, and took the M.R.C.S., L.R.C.P. in 1905, and subsequently the F.R.C.S. in 1907 and the M.B., B.S. Lond. in 1909. After filling the post of senior house-surgeon at St. Bartholomew's Hospital he entered the Indian Medical Service as lieutenant on September 1, 1906, became lieutenant-colonel on March 1, 1926, and retired on November 10, 1932. He served on the North-West Frontier of India in the Zakka Khel campaign of 1908, receiving the frontier medal with a clasp. On June 1, 1917, he received the Kaisar-i-Hind Medal, First Class, and the C.I.E. on January 1, 1926. He had been a member of the British Medical Association since 1910.

Obituary

Mr. CHARLES ARTHUR PARKER, who died at High Wycombe on January 26, was the son of a Lincolnshire clergyman and younger brother of the late Lord Parker of Waddington, Lord of Appeal in Ordinary. From Bradford College he went to St. Bartholomew's Hospital in 1882—at the age of 19—and after qualifying as M.R.C.S. and L.S.A. in 1886 became house-surgeon to Sir William Savory. He was then in turn resident medical officer, senior clinical assistant, and surgeon at the Throat Hospital, Golden Square, being elected to the consulting staff on his retirement from professional work in 1925. He had obtained the F.R.C.S.Ed. diploma in 1894, and for some years combined general practice at Rickmansworth with his laryngological practice in London. Parker wrote a small book on post-nasal growths in 1894, and in 1906 published his *Guide to Diseases of the Nose and Throat and their Treatment*, of which a second edition, with Mr. Lionel Colledge as joint author, appeared in 1921. His standing in the specialty was recognized by election to the presidential chair of the Laryngological Section of the Royal Society of Medicine. For the past twelve years he had lived wholly at High Wycombe, and entered into the public life of the district. He served on the borough council and was active in the local branch of the St. John Ambulance. Though he took no part in the ordinary medico-political work of the British Medical Association during thirty years of membership, Parker was profoundly interested in some of the larger aspects of medical and public health policy. With Professor Benjamin Moore he was an early advocate of a State medical service to replace the wasteful competition and the lack of co-ordination, and bridge the gaps, which they deplored in medical practice.

The death occurred on January 2 of Dr. ROBERT WATSON at his residence, 184, Belmont Road, Belfast. He was educated at Queen's University, Belfast, and graduated M.B., B.Ch., B.A.O. in 1895. He proceeded M.D. in 1899. He was one of the best-known practitioners in East Belfast, where he had practised for thirty-five years. His outlook on life was sincere: he had definite principles which made him a pleasing colleague and a great friend of his patients. The regard in which he was held by his patients and friends was a tribute to his personality. During all the years of his practice in the Bloomfield area he made numerous lifelong friends, and it was with regret that his many patients learned that he intended to retire at the end of 1936. Unfortunately the years of leisure he had planned with his wife and family were not fulfilled, and a sudden end has occurred to a happy life of usefulness. In addition to his professional practice Dr. Watson had art as a hobby, some of his paintings being hung in the Belfast Municipal Art Gallery. He was a firm advocate of the temperance cause, but while maintaining his principles he never lost a friendship. His wife is a doctor, as also are two of his daughters. He had been a member of the British Medical Association for nearly thirty years.

Mr. GRAVES STOKER, F.R.C.S.I., who died on January 28 at the age of 73, at his residence, Gaddesden Hall, near Hemel Hempstead, received his medical education in London, Trinity College, Dublin, and Vienna. In 1889 he became a Fellow of the Royal College of Surgeons of Ireland, where he was at one time senior demonstrator in anatomy. Continuing his father's practice in Rutland Square, Dublin, he was later elected consulting surgeon to Cork Street and Drumcondra Hospitals, and for some years was also a member of the Council of the Royal College of Surgeons of Ireland. On the death of his brother Ernest Mr. Graves took over his practice in London, and resided there until 1932. During the war he was attached to the Rochester Row Military Hospital, and was later

appointed assistant surgeon to St. Paul's Hospital, Endell Street. He had been a member of the British Medical Association for thirty-two years in all, and in 1915 contributed to the *British Medical Journal* a record of 1,000 operations for the radical cure of hernia; he had also published pamphlets on the treatment of venereal diseases. In his youth a keen Rugby player, he had been a member of the Dublin Wanderers team. In 1903 he married Constance Bennet, M.B., Ch.B., who survives him with two sons and three daughters.

At the time of his death on January 28, at the age of 84, Dr. GEORGE HANNA RUSSELL was the senior magistrate of Manchester, having been appointed to the Bench in 1892. He received his medical education at Guy's Hospital, where he won the Treasurer's Gold Medal; in 1879 he graduated M.B.Lond. and became a Member of the Royal College of Surgeons. He proceeded M.D. in 1882. Three years later, after spending a short time in the Australian bush as a medical attendant and travelling companion, he removed to Manchester. Here he built up a large general practice, interesting himself also in the public life of Gorton and Longsight, being one of the Liberal leaders who supported against strong opposition the amalgamation of these two districts with the city. After the amalgamation he headed the poll in the first election to the City Council, and was the first alderman to represent the Longsight ward. When he retired from active municipal life he continued his interest in Parliamentary elections, often taking the chair for Liberal candidates at their meetings.

Dr. JOHN RUSK died at his residence, Antrim Road, Belfast, on January 26 in his seventy-fifth year. He was educated at Queen's College, Belfast, and graduated M.B., B.Ch., B.A.O. in 1894. He was well known for many years, and not only in his profession. For some time past he had been in indifferent health, but his friends did not know that the end was so near. As a student at Belfast he was popular and outstanding; later he pursued postgraduate study in Galway and Vienna, and the experience he gained, in conjunction with his natural ability and pleasing personality, soon assured him of an extensive practice. Literature and bowls were his hobbies, and, in addition, he was interested in the temperance cause. To the bowling fraternity Dr. Rusk was almost an institution. He first became interested almost forty years ago, and his skill was so much appreciated that he was a member of the Irish team in international contests, and toured in Australia and New Zealand as a representative in the Empire games. His friends in the medical profession will miss one of the most loyal of colleagues and one of the most respected of the senior generation, which is so fast disappearing in Belfast. Much sympathy will be extended to his widow and brother. He had been a member of the British Medical Association for forty years. He was a Fellow (late vice-president and honorary treasurer) of the Ulster Medical Society.

Dr. EDWARD WALTON SPENCER ROWLAND, who died on January 22 at his home in Reading at the age of 64, was the second son of the Rev. Charles Brown Rowland, formerly vicar of Wolverley, Worcestershire. He began his medical studies at the University of Cambridge, and after taking his B.A. went to Guy's Hospital and qualified as M.R.C.S., L.R.C.P. in 1899. He then served as house-physician, senior obstetric resident, and clinical assistant at Guy's. While in general practice he was appointed surgeon to the Reading Dispensary, afterwards medical officer to the borough infectious diseases hospital and medical officer to St. Andrew's Boys' Home, an institution in which he took much interest. Dr. Rowland was for some years consultant for cerebrospinal fever to the Berkshire County Council. He joined the British Medical Association in 1902 and was elected chairman of the Reading Division in 1918; he was also a member of the Reading Pathological Society. He retired from active work a few years ago.

Medical Notes in Parliament

The House of Commons this week completed the committee stage of the Coal Bill.

The Middlesex Hospital Bill, the St. Bartholomew's Hospital Bill, and the Salford Royal Infirmary and Hospital Bill were read a first time in the House of Lords on February 1.

Sir Kingsley Wood presented the Housing (Financial Provisions) Bill on February 2, and it was read a first time. The Bill alters the basis of subsidy for the rehousing of persons from overcrowded dwellings and also proposes a new subsidy for rural housing.

The Prevention and Treatment of Blindness (Scotland) Bill was reported to the House of Commons on February 8 without amendment from the Standing Committee on Scottish Bills.

Sir Francis Fremantle, Dr. Salter, and Dr. Howitt have invited all Members of both Houses to a meeting at the House of Commons on February 17, when Lord Horder and Sir Frank Fox will speak on the work of the British Empire Rheumatism Council.

The Parliamentary Medical Committee, meeting at the House of Commons on February 8, discussed milk as a food and the attitude of the Press towards the advertisements proposed by the British Medical Association. In the discussion some sympathy was expressed for those critics who fear that too great attention to the dangers of milk will frighten people from consuming it. The meeting heard an account of the milk policy pursued in Northern Ireland and of its results. The committee also favourably discussed the Night Baking Bill. Notice was taken of the lack of medical books in the House of Commons library, and the possibility of remedying this was discussed.

Foot-and-Mouth Disease

On February 1 Mr. W. S. MORRISON, replying to Mr. A. Short, said that since his last statement in the House on the foot-and-mouth disease position on November 11 additional farms had been declared infected, but in the majority of these infection was due to contiguity to existing outbreaks. There had, on the whole, been an improvement. Excluding an isolated outbreak in Essex confirmed on January 22, and one in Kent on January 14, there had been no outbreaks for three weeks in any of the eastern or south-eastern counties to which it was necessary to apply a "standstill" order. Of a total of thirty-six outbreaks confirmed during the past fourteen days, thirty-three were in the adjoining counties of Wilts, Dorset, Somerset, Berkshire, and Hampshire, the remaining three outbreaks being in Essex and the West Riding.

The Blind Persons Bill

During the committee stage of the Blind Persons Bill in the House of Commons on February 1 Mr. JAGGER moved an amendment to ensure that if any dispute arose whether or not a person was blind within the meaning of the Bill the local authority where the person lived should make arrangements for that person to be examined by two ophthalmic surgeons, whose decision, unless there was disagreement, should be final. Where there was disagreement the local authority should arrange for the person to be examined by a third ophthalmic surgeon, whose decision should be final.

Sir KINGSLEY WOOD said he could not accept the amendment. The schedule to a circular issued by his Department in 1933 set out the optical criteria necessary, and recommended that the examination should be carried out by a medical practitioner with special experience in this kind of work. The effect had been to reduce very substantially the number of

cases in which any reasonable doubt could arise about a person's blindness. In a number of cases local authorities also had available a referee service—as, for instance, that provided by the Northern Counties Association. It would not be practicable everywhere to establish such a service or make the arrangements proposed by the amendment, because in some areas it would be difficult and in others impossible to find the requisite number of medical practitioners with the special experience necessary.

The amendment was withdrawn and the Bill passed through committee.

Pasteurized Milk and Tuberculous Infection

Mr. W. S. MORRISON told Captain Arthur Evans on February 7 that his attention had been drawn to investigations carried out by the Hannah Institute of Dairy Research into the feeding of calves on raw and pasteurized milk by experiments with two groups of calves, the first group with ordinary commercial milk in its raw state, the second group with the same milk after it had been submitted to ordinary commercial pasteurization in a local dairy. The results showed that of the thirty-six calves fed on ordinary commercial milk in its raw state twenty-three were ultimately found to be infected by tuberculosis mainly in the lungs, and of the thirty-seven calves fed on the same milk after it had been submitted to ordinary commercial pasteurization in a local dairy no case of tuberculous infection was found. The Government intended to bring forward legislation this session on the lines of the proposals regarding the compulsory pasteurization of milk, which were outlined in the White Paper on milk policy issued last July.

Typhoid in Somerset.—Twenty-four cases of typhoid (three fatal) in the county of Somerset had been confirmed when Sir KINGSLEY WOOD, on February 3, answered a question about the outbreak. The source of infection had not then been established, and a medical officer of the Ministry of Health was assisting in the investigations.

Research in Epilepsy.—In a reply to Sir Arnold Wilson on February 3 Sir KINGSLEY WOOD stated that the Medical Research Council was carrying out investigations bearing upon epilepsy and related conditions. The British Government was not officially represented on the Council of the International League against Epilepsy, nor did it make a contribution in aid of the Council's work.

School Children and Free Milk.—Mr. KENNETH LINDSAY, in a reply on February 3, said the Board of Education recognized it was desirable that children selected for free milk at school should continue to receive it when absent through illness. It would be difficult to devise suitable arrangements, but the matter was receiving consideration. When children were recommended for free meals or milk it was not necessary that they should first be certified by the school medical officer as suffering from subnormal nutrition. It was important, however, in the interests of the children that those selected should be seen by him as soon as possible.

Health of Durham School Children.—Mr. KENNETH LINDSAY, for the Board of Education, furnished the following table on February 8:

School Children Examined at Routine Medical Inspections in Durham County Council's Area

Year	Number Inspected	Classification of the Nutrition of Children Inspected							
		Excellent		Normal		Slightly Subnormal		Bad	
		No.	%	No.	%	No.	%	No.	%
1935	40,476	5,151	12.7	26,193	64.7	8,025	19.8	1,107	2.7
1936	40,500	5,269	13.0	26,599	65.4	7,691	19.0	641	1.6
1937	39,874	5,252	13.2	25,673	64.4	8,522	21.4	397	1.0

Lieutenant-Colonel MAURICE SWABEY, R.A.M.C. (ret.), died at Bath on January 27, aged 69. He was born at Prince Edward Island, British North America, on July 4, 1868; the son of the late Rev. Henry Birchfield Swabey, was educated at St. Bartholomew's Hospital, and took the M.R.C.S., L.R.C.P. in 1892. After filling the post of junior house-surgeon at the Wolverhampton and South Staffordshire County Hospital, he entered the Army as surgeon lieutenant on July 29, 1896, became lieutenant-colonel in the long war promotion list of March 1, 1915, and retired on September 27, 1922. He served in the war of 1914-18.

Lieutenant-Colonel JAMES SCOTT, Madras Medical Service (ret.), died at Dumfries on January 19, aged 78. He was born on July 20, 1859, the son of James Scott, manufacturer, of Troqueer, Kirkcudbright, and was educated at Edinburgh University, where he qualified M.B., C.M. in 1880. He entered the Indian Medical Service as surgeon on April 1, 1882, became lieutenant-colonel after twenty years' service, and retired on October 23, 1907. He served in the campaign on the North-West Frontier of India in 1897-8, in the Tochi Valley, receiving the frontier medal with a clasp. His whole service was passed in military employment.

Colonel CHARLES HENRY BEATSON, C.B., Bengal Medical Service (ret.), died at Colchester on January 20, aged 86. He was born at Table Bay, Cape of Good Hope, on March 27, 1851, the son of Surgeon General G. S. Beatson, C.B., Army Medical Department, was educated at Edinburgh and Glasgow Universities, and took the L.R.C.P. and S.Ed. in 1873. He entered the Indian Medical Service as surgeon on September 30, 1876, and was on temporary half-pay from May 8 to December 21, 1882. He attained the rank of colonel on June 16, 1905, and retired on March 27, 1911. He spent his service in military employment. He served in the second Afghan War in 1879-80, receiving the medal, and on the North-East Frontier of India in the Manipur campaign of 1891, when he was mentioned in dispatches and received the frontier medal. He rejoined for service in the war of 1914-18, and served from October, 1914, to 1916, being employed in connexion with the Indian hospitals in England. He received the C.B. on June 23, 1907.

Universities and Colleges

UNIVERSITY OF OXFORD

The Master and Fellows of University College have established a Radcliffe Medical Fellowship out of surplus income of the Linton Fund, to be tenable as an official Fellowship. If a suitable candidate presents himself the Master and Fellows will elect him in Trinity Term, 1938, to this Fellowship, combined with a Praelectorship in Medical Science. The Fellow will be responsible for teaching in physiology and biochemistry for the Final Honour School and for supervision of members of the College reading biology and medicine. He may also be required to take a share in the general work of the College, and must reside within the College during full term. He will enter on his duties on October 1, 1938. The initial emoluments of the Fellowship and Praelectorship will be not less than £450 per annum, with rooms in college free of rent, rates, and taxes, and participation free of charge in the common college dinner. The Fellowship is open to all candidates who have passed the examination for B.M. in the University of Oxford, or an equivalent degree elsewhere. Further particulars may be had from the Master, to whom applications, with not more than three testimonials and three personal references, should be sent by April 30.

UNIVERSITY OF CAMBRIDGE

The Raymond Horton Smith Prize for 1936-7 has been awarded to H. L. H. Green, M.D., of Sidney Sussex College. The prize is awarded to the candidate who presents the best thesis for the M.D. degree during the academical year.

At a congregation held on February 4 the following medical degrees were conferred:

M.D.—R. M. Dowdeswell.
M.B., B.Chir.—J. S. Joly, R. D. I. Beggs.
M.B.—K. L. Buxton.

* By proxy.

UNIVERSITY OF LONDON

UNIVERSITY COLLEGE

A course of three public lectures on "Surface Chemistry and Biology" will be given by Dr. J. F. Danielli in the department of physiology, pharmacology, and biochemistry of the College on Mondays, at 5 p.m., beginning February 28. The lectures are open without fee or ticket to students of the University and others interested in the subject.

UNIVERSITY OF DURHAM

On February 2 the Council of King's College, Newcastle-on-Tyne, approved the appointments of Dr. Albert Gild and Dr. J. W. M. Sutherland as demonstrators in anatomy.

UNIVERSITY OF LIVERPOOL

The Council of the University on February 1 conferred the title of Professor Emeritus on Walter Scott Patton, M.B., Ch.B.Ed., Dutton Memorial Professor of Entomology, 1927-37.

ROYAL COLLEGE OF PHYSICIANS OF LONDON

The Croonian Lectures, on "The Clinical Aspects of the Transmission of the Effects of Nervous Impulses by Acetylcholine," will be delivered at the College, Pall Mall East, S.W., by Professor F. R. Fraser on May 24, 26, and 31, at 5 p.m.

BRITISH COLLEGE OF OBSTETRICIANS AND GYNAECOLOGISTS

A quarterly meeting of the Council was held in the College House, 58, Queen Anne Street, London, on January 29, with the President, Sir Ewen Maclean, in the chair. Professor Grace Stapleton, New Delhi, India, was admitted to the Fellowship of the College.

Membership

Dr. Allan Frederick Hollinrake, Hamilton, Canada, was admitted a Member of the College and the following were elected to Membership:

Yeshwant Narayan Ajinkya (India), John James Armitage (Salisbury), Elinor Francis Elizabeth Black (Canada), Doris Barbara Brown (Harrogate), William Deans Brown (London), William Davies Cunningham (Australia), Mary Evans (Manchester), Martin Birks Hallam (Manchester), Ockert Stephanus Heyns (Manchester), Fergus Duncan Johnston (Canada), John Cameron Loxton (Australia), Benjamin Edward Meek (Canada), John Miller (Greenock), Edward Brettingham Moore (Tasmania), Susanne Jean Paterson (Edinburgh), Robert William Nichol (London), Charles Guy Roworth (Aberdeen), Linton Morris Snaith (Manchester), David Fox Standing (South Africa), Dorothy Marian Stewart (London), Robert Atkinson Tennent (Glasgow), Geoffrey Thompson (Australia), William Howie Tod (Leeds), John Clinton Whyte (Canada), Ali . . .

The President has been appointed representative of the College on the Royal Commission on the Geographical Distribution of the Industrial Population, and Mr. J. Bright Banister representative on the Council of the Queen's Institute of District Nursing.

The name of Mr. Harold Burt-White has been restored to the roll of Members of the College.

ROYAL COLLEGE OF PHYSICIANS OF EDINBURGH

At a quarterly meeting of the College, held on February 1, with the president, Dr. Alexander Goodall, in the chair, Dr. J. D. W. Pearce (London), Dr. J. P. McGibbon (Edinburgh), and Dr. W. M. Arnott (Edinburgh) were introduced and took their seats as Fellows of the College.

CONJOINT BOARD IN SCOTLAND

The following candidates, having passed the requisite examinations, have been admitted L.R.C.P.Ed., L.R.C.S.Ed., L.R.F.P. and S.Glas.:

M. J. Ackerhalt, Zola S. Alpert, A. Appel, S. Bauman, R. A. Blair, E. Cohn, R. M. Cross, T. B. Dev, R. B. Dobson, E. F. Duschock, M. M. Elkind, M. Friedman, J. Gillman, K. A. Graf, H. Grundmann, V. Guyer, A. T. R. Hamilton, T. W. Howat, H. Hutton, W. M. Jamieson, K. E. Karunaratne, Yetta Kuper, M. Levin, H. Leibowitz, M. Lichtensteinas, J. T. McCutcheon, P. W. Fitz-J. McIlvanna, J. McMillan, K. P. F. J. M. Mangold, W. Meadow, J. E. Mishler, W. S. Murray, R. P. Myers, Anna Noll, U. E. Oberworth, S. Pollack, J. S. Pomerantz, L. Rae, A. Rapoport, F. L. Reardon, C. G. Rosenstock, W. Rothman, N. Schwartz, L. Scovronck, M. Shapiro, M. R. Simon, W. E. C. Taylor, A. J. Walder, M. Weinschel, D. Wilson, A. A. Wright.

EPIDEMIOLOGICAL NOTES

Enteric Fever

There have been no fresh cases of typhoid fever in Croydon during the last week, and the number of deaths remains at 43—that is, there have been no additional deaths since the 2 recorded in the previous week. Of the 8 cases of enteric fever notified in London 3 were in the borough of Stepney, 2 in Hampstead, and 1 in Wandsworth, while the remaining 2 cases were of paratyphoid fever, one in the City of Westminster and the other in the borough of St. Marylebone. To the 14 notified cases of typhoid fever mentioned last week in Somerset 21 more have been added, while the deaths remain at 3. The cases have been limited to the Highbridge and Bridgwater areas, but Bridgwater itself has not been involved. As a precautionary measure the Highbridge elementary schools and the secondary schools in Bridgwater have been closed. The source of the infection is not known. Two cases of typhoid fever were notified at Plymouth this week. Twenty-eight new cases of typhoid fever in Pembrokeshire have brought the total to 38 at the time of going to press; to date there have been 3 deaths. During the last three months there have been 21 cases of paratyphoid in Northumberland compared with 2 in the preceding quarter. While the majority of cases have been reported in Newcastle—5 fresh cases were reported last week—the disease has cropped up in several other parts of the county. The appearance of enteric fever in these localities has increased the notifications for England and Wales as a whole: the figure for the week ending January 29 being 61, compared with 19 in the previous week and 53 in the corresponding week last year. In London the number during the week has increased from 4 to 8.

Diphtheria and Scarlet Fever

The incidence of diphtheria continues to rise in England and Wales, the notifications being 1,892 for the week under review, compared with 1,737 in the previous week and 1,241 in the corresponding week last year; the median value for the last nine years is 1,400. London has shared in the increase, the notifications for the week being 200, compared with 179 in the previous week and 129 in the corresponding week last year. On the other hand, in Scotland the notifications have dropped from 252 to 245, but still remain higher than the figure of 217 for last year; and in Eire and Northern Ireland small increases have been recorded during the week under review. On the other hand, scarlet fever has shown a decided drop in England and Wales—2,431 against 2,459 in the previous week—but the figure is higher than that of 1,414 in 1936 and somewhat greater than the median value—2,312—for the last nine years.

Measles

As measles is only notifiable in the boroughs of Shoreditch, Stepney, Bermondsey, and the Port of London exact figures of its incidence in London are not available. An advance in the present epidemic is suggested by an increase of notifications from 17 to 23 during the week. Confirmatory evidence is furnished by the numbers of measles cases reported among the children of the L.C.C. elementary schools—784 cases compared with 522 in the previous week—and by the average daily admissions to the L.C.C. fever hospitals, which have risen from 25 to 32. The London deaths numbered 2 against 3 in the previous week, while for England and Wales the measles deaths have dropped from 48 to 37. In Scotland notifications of measles have risen from 1,544 to 1,661, and the deaths from 14 to 17. In Glasgow the numbers notified during the week have fallen from 1,077 to 1,013, and in Edinburgh from 214 to 172; but in Dundee the numbers have risen from 141 to 338, and small outbreaks have occurred in various localities. In Belfast measles notifications have fallen from 832 to 728, but the deaths for the week have increased from 15 to 22.

Medical News

A meeting of the Chelsea Clinical Society will be held at the Hotel Rembrandt, Thurloe Place, S.W., on Tuesday, February 15, at 8.30 p.m., when Dr. Charles F. White, medical officer of health for the City of London, will open a discussion on "Quarantine, Past, Present, and Future." The meeting will be preceded by dinner at 7.30 p.m.

A meeting of the Society of Medical Officers of Health will be held at 1, Thornhaugh Street, Russell Square, W.C., on Friday, February 18, at 5 p.m., when Dr. Hugh Paul will open a discussion on "Present Practice in Regard to Quarantine and Disinfection." The Maternity and Child Welfare Group of the Society will meet at 1, Thornhaugh Street, W.C., on Friday, February 25, at 5.30 p.m., when Dr. Ethel Cassie will read a paper on "Children Living Apart from their Parents, including the 'Daily Minded'."

The Hunterian Society has arranged a banquet to commemorate the 210th anniversary of the birth of John Hunter to be held at the May Fair Hotel, Berkeley Street, W., on Thursday, February 17, at 7.15 for 7.30 p.m. The price of the dinner will be 12s. 6d. (exclusive of wines), and will be collected at the table. The Lord Mayor of London and other distinguished guests will be present.

A joint meeting of the Royal Sanitary Institute and the Yorkshire Branch of the Society of Medical Officers of Health will be held at Dewsbury Town Hall on Friday, February 11, at 5.30 p.m., when discussions will take place on "The Laboratory Examination of Milk," to be opened by Dr. P. L. Sutherland, and on "The Maternity Services," to be opened by Dr. J. F. Galloway.

The British Institute of Philosophy announces an address entitled "Philosophy and the Common Reader," by Professor L. S. Stebbing, on Tuesday, February 15, at 8.15 p.m., at University College, Gower Street. Cards of admission can be had from the Director of Studies, University Hall, 14, Gordon Square, W.C.1.

The next quarterly meeting of the Royal Medico-Psychological Association will be held at 11, Chandos Street, W., on Thursday, February 17, at 2.30 p.m., under the presidency of Dr. Douglas McRae. Dr. S. Sharman will read a paper on "Some Observations on the Theory of Perception."

Sir Walter Langdon-Brown will deliver the second Skinner Lecture on "The Pursuit of Shadows" before the British Association of Radiologists, 32, Welbeck Street, W., on Friday, February 18, at 4 p.m. All members of the medical profession are invited to attend.

On Friday, February 18, at 4 p.m., at the Royal Army Medical College Library, Millbank, Lady Keogh will present the Banner of a Knight Grand Cross of the Order of the Bath, bequeathed to the College by the late Lieutenant-General Sir Alfred Keogh.

A congress of cosmobiology will be held at Nice in April. Further information can be obtained from Dr. Maurice Faure, 24, Rue Verdi, Nice.

There is a certain amount of time available for the treatment at University College Hospital of cases of malignant disease, other than patients of the hospital, with the two-gramme mass unit of radium. It is particularly suitable for the irradiation of superficial carcinoma, growths of the mouth and pharynx, and glandular fields. Applications for the treatment of patients should be sent to the Harker Smith Registrar, University College Hospital, London, W.C.1.

The Medical Research Council has been entrusted with an annuity of £350 for a period of twenty-five years, provided by the late Mr. Eugen M. Schlesinger and by Mrs. Schlesinger to establish a memorial to their daughter in the form of a Kathleen Schlesinger Research Fellowship. This is to be given for investigations on the subject of cysts of the brain or allied conditions, and will ordinarily be tenable at the National Hospital for Diseases of the Nervous System, Queen Square, London, for periods of from one to three years. Awards will be made by the Council with the assistance of a special advisory committee appointed in terms of the trust deed.

INFECTIOUS DISEASES AND VITAL STATISTICS

We print below a summary of Infectious Diseases and Vital Statistics in the British Isles during the week ended January 29, 1938.

Figures of Principal Notifiable Diseases for the week and those for the corresponding week last year, for : (a) England and Wales (London included). (b) London (administrative county). (c) Scotland. (d) Eire. (e) Northern Ireland. Median values for the last 9 years for (a) and (b).

Figures of Births and Deaths, and of Deaths recorded under each infectious disease, are for : (a) The 125 great towns (i) in England and Wales (including London). (b) London (administrative county). (c) The 16 principal towns in Scotland. (d) The 13 principal towns (ii) in Eire. (e) The 10 principal towns (iii) in Northern Ireland.

A dash — denotes no cases ; a blank space denotes disease not notifiable or no return available.

Disease	1938					1937 (Corresponding Week)					1923-36 (Median Value Corresponding Weeks)

EPITOME OF CURRENT MEDICAL LITERATURE

Medicine

122 Cancer of the Lungs

F. HARBITZ (*Norsk Mag. Laegevidensk.*, December, 1937, p. 1451) reports from the Rikshospital in Oslo his observations during the past six years on thirty-four cases of cancer of the lung examined post mortem; in 1936 alone there were as many as twelve cases. This observation made the author carefully examine all the seventy-five specimens of cancer of the lung in his possession, and he has come to the conclusion that much of the alleged increase in the frequency of this disease is the outcome of improved clinical, anatomical, and microscopical diagnosis, as well as of the increase in the expectation of life and of certain other circumstances. So far he can find no reliable evidence of any real increase in the frequency of cancer of the lungs in our own times. As the patients were males in only forty of his seventy-five cases, he disagrees with the opinion, accepted in most countries, that cancer of the lungs is from three to four times more frequent in men than in women. The Norwegian vital statistics for 1919-34 showed 183 male to 170 female cases of cancer of the lung. The disease showed no peculiar preference for any area, rural or urban, nor for any profession or occupation, nor for persons supposed to be exceptionally exposed to exhaust gases, fumes of tar, or other irritants. But it was notable that chronic pulmonary disease of various kinds, with the exception of pulmonary tuberculosis, had often been a prelude to the cancer, which might possibly have been promoted thereby. In favour of a constitutional disposition to cancer, Professor Harbitz refers to the youthfulness of some of his patients, among whom were a boy of 12 and a woman of 26. He recognizes four forms of cancer of the lung—the bronchial, the pneumonic, the haemorrhagic-pleuritic, and the mediastinal.

123 Angiospastic Retinitis

F. VOLHARD (*Klin. Mbl. Augenheilk.*, November, 1937, p. 600) discusses the pathogenesis of angiospastic retinitis. He claims that definite contraction or narrowing of the vessels without any retinal changes often occurs months or even years before the onset of angiospastic retinitis, and refers to a case described by Hasselhorst and Mylius. This was a case of pre-eclampsia, in which these observers were able to follow with the ophthalmoscope the increasing contraction of the fundal vessels and the onset and disappearance of angiospastic retinitis. This form of retinitis has generally been regarded as uraemic, but more recent methods for testing renal function have shown that it often appears long before any signs of renal insufficiency can be detected, so that it may be regarded not as an effect of renal insufficiency but rather as a sign of impending insufficiency. This form of retinitis is not associated with any and every form of high blood pressure, but only with that form which is characterized by pallor of the skin, ischaemia of the skin capillaries, pale kidneys, and a high diastolic blood pressure. The author calls this "pale high-pressure" in contrast to the "red high-pressure" which is associated with a red face, red kidneys, and a high systolic but low diastolic blood pressure, and states that it must be due to a general contraction of all arterial vessels. This explains, for example, how this form of retinitis may supervene on so many different affections of the kidneys and blood vessels and also how angiospastic retinitis may end in recovery in those cases in which it is possible to improve the circulation and lower the blood pressure.

Surgery

124 Pseudarthroses

G. SOMMER (*Med. Klinik*, December 17, 1937, p. 1708) distinguishes two kinds of pseudarthroses—namely, those produced by local conditions and those caused by general constitutional disturbances, such as tuberculosis, syphilis, affections of the central nervous system, endocrine disturbances, etc. One of the most common local causes of pseudarthrosis was fracture with splintering of the fragments and infection of the wound. The next commonest cause was an interposition of soft parts between the fragments. The production of pseudarthrosis was further found to depend on the kind of fracture and the age of the patient, as, for example, in fractures of the femoral neck in elderly people. Lastly, wrong treatment, such as inadequate immobilization, was not infrequently responsible for the false joint. Pseudarthrosis was more frequent in men than in women (forty-one men and twelve women). Of the fifty-three patients observed, thirty-four were between the ages of 14 and 30. In forty-three of the fifty-three patients the treatment of the pseudarthrosis was surgical. The kind of operation varied according to conditions, but in every case it was found necessary to open up all sclerosed medullary spaces and to lay wide open the fractured ends of bone in order to stimulate vascular formation and encourage the formation of callus through the breaking up of bone tissue and through the operative haemorrhage. During the last few years the majority of cases of pseudarthrosis have been treated by Lexer's method as modified by Wenzel, and this technique is briefly described.

125 Early Symptoms of Arterial Obliteration

According to M. SUSSTRUNK (*Schweiz. med. Wschr.*, December 4, 1937, p. 1157) trophic lesions of the toes in thrombo-angiitic or arteriosclerotic arterial obliterations in the lower extremities are late signs of a disease which may have existed for three to five years. Among the common wrong diagnoses in the early stages are rheumatism, flat-foot, alcoholic neuritis, and ingrowing toe-nail. Careful inquiry may elicit a history of acute onset, perhaps with a sudden feeling of weakness in one leg (rarely both) which disappeared after a few days' rest but was followed by the gradual appearance of intermittent claudication, a symptom which is present sooner or later wherever the obliteration is situated, and is usually accompanied by pains in the heel and dorsum of the foot. When the obstruction is in the femoral artery or lies more centrally, the calves are painful. With progress of the disease pain is felt in the legs during the night, owing to the ischaemia following nocturnal cardiac depression. A lasting feeling of coldness of the feet is a significant sign. Inspection of the extremities may show pallor, bristliness of the hairs, thickening or grooving of the nails, and emptiness of the veins on the dorsum of the foot. Probably because the more central obliterations are associated with the earlier establishment of collateral circulation, closure of the common or external iliac artery causes relatively early atrophy but relatively late gangrene. An important sign of obliteration of the common iliac artery in the male is impotence, erection becoming impossible. When the findings of arterial palpation are indecisive, comparison of the sphygmomanometric oscillations on the two sides, as well as arteriography, may yield valuable information. Early diagnosis is particularly important, for when the obliteration is distal to the femoral artery prospects of cure by arterial excision are very slight.

Letters, Notes, and Answers

All communications in regard to editorial business should be addressed to THE EDITOR, BRITISH MEDICAL JOURNAL, B.M.A. HOUSE, TAVISTOCK SQUARE, W.C.1.

ORIGINAL ARTICLES and LETTERS forwarded for publication are understood to be offered to the *British Medical Journal* alone, unless the contrary be stated. Correspondents who wish notice to be taken of their communications should authenticate them with their names, not necessarily for publication.

Authors desiring REPRINTS of their articles published in the *British Medical Journal* must communicate with the Secretary, B.M.A. House, Tavistock Square, W.C.1, on receipt of proofs. Authors over-seas should indicate on MSS. if reprints are required, as proofs are not sent abroad.

All communications with reference to ADVERTISEMENTS should be addressed to the Advertisement Manager. Orders for copies of the *Journal* and communications with reference to subscriptions should be addressed to the Secretary, B.M.A. House, Tavistock Square, W.C.1.

The TELEPHONE NUMBER of the British Medical Association and the *British Medical Journal* is EUSTON 2111.

The TELEGRAPHIC ADDRESSES are
EDITOR OF THE BRITISH MEDICAL JOURNAL, Aitology
Westcent, London.

SECRETARY, Medisecra Westcent, London.

The address of the B.M.A. Scottish Office is 7, Drumsheugh Gardens, Edinburgh (telegrams: Associate, Edinburgh; telephone: 24361 Edinburgh), and of the Office of the Irish Free State Medical Union (I.M.A. and B.M.A.), 18, Kildare Street, Dublin (telegrams: Bacillus, Dublin; telephone 62550 Dublin).

QUERIES AND ANSWERS

"Cracking Skin"

Dr. F. ARTHUR HEPWORTH (Saffron Walden), in reply to Dr. A. E. Moore's question in the *Journal* of January 29 (p. 264), writes: Cracking of the skin of the hands and feet is usually associated with dryness of the skin all over the body; it is present from early childhood, and probably inherited. The hands should be treated with glycerin (2 parts) and water (1 part) after washing. Pure glycerin is unsatisfactory and lotions made with mucilage are useless. The diluted glycerin is rubbed on the skin when half dried, paying special attention to finger joints and tips, and then drying is completed with a dry towel. Use superfatted soap, dry the hands very carefully, and don't wash more often than is necessary. Always wear gloves in winter, or at any time when north or east winds are about. For cracked heels rub in an ointment containing a little zinc oxide and bismuth every morning and evening. The best time being after a hot bath. A few days' treatment is usually enough. The ointment should be made with animal or vegetable fatty base, not soft paraffin. Another useful application for hands and feet is "camphor-ball" (Martindale's *Extra Pharmacopoeia*, p. 314). For deep painful cracks on the fingers an old-fashioned treatment is to drop melted cobbler's wax into each crack and cover with a small piece of paper or linen before it sets, in order to prevent the wax sticking to articles handled and to hide the unsightly blob of wax. This is the only remedy I know which stops the pain at once and really heals the crack. I have recently met with a severe case of cracked hands appearing as a new condition in adult life and not associated with dry skin elsewhere. This has almost recovered under treatment by ultra-violet light and application of linimentum calaminae. I believe this to be an occupational dermatitis.

Treatment of Ascites

"PERPLEXED" writes: I should like suggestions from readers with similar experience as to the best treatment for the following troublesome case of ascites. An elderly lady, a following troublesome case of ascites. An elderly lady, a widow aged 70 with four children, who had a long alcoholic history, noticed a swelling of the abdomen about one year ago. She was first examined in June, 1937, and paracentesis was performed in July. From the end of August tapplings have had to be done every week, amounts of from 7 to 11 or 12 pints being withdrawn each time. The fluid is straw-coloured, usually clear, but sometimes a little milky, and examination shows an excess of endothelial cells. Pathologists report that the condition might be either neoplastic or due to a cirrhotic liver. The patient feels very well, apart from the swelling of the stomach, and gets about her

house doing light work. The pulse rate is 80, occasionally there is slight oedema of the feet and some altered blood in the motions, but the general aspect does not suggest malignant disease. X-ray examination of the colon and a straight x-ray were negative, as was the Wassermann test. Thirty years ago she had an operation for simple ovarian cyst. On examination of the abdomen after paracentesis the edge of the liver is felt to be very hard and shrunken to the xiphisternum. There is also a small mass, possibly enlarged glands, in the right iliac fossa. I should like to know of any alternative methods of treatment in order to avoid frequent tapplings. Treatment with purgation, salyrgan, diuretics, and antiphlogistine has been tried without effect.

Fomites

"SENEX" writes from Kent: Apropos of Professor Miles Phillips's article on the history of the prevention of puerperal fever (*Journal*, January 1) the word "fomites" seems to be wrongly used: "The actual fomites were the micro-organisms of Lecuwenhoek." My dictionary gives "Fomes (pl. fomites), a substance capable of retaining contagious germs... as woollen garments and bedclothing." Is there any authority for Professor Phillips's use of the word?

* * In medical usage "fomes" (Latin for tinder, kindling-wood, or touch-wood) means any substance other than food capable of acting as the medium for transmitting or harbouring contagion; it is usually employed in the plural.

LETTERS, NOTES, ETC.

Rehabilitation After Injuries

Dame GEORGINA BULLER, chairman of the Training Committee of the 'Cripples' Training College, Leatherhead Court, Surrey, writes: My attention has recently been called to a review which appeared in your *Journal* for January 22 of the recently published *Handbook on the Welfare of Cripples*. In this article the writer states that: "At present, while the treatment of injuries, restoration of function, and vocational training are provided to some extent at centres in different parts of England, there is still no provision for reconditioning, except at the small centre established by the L.M.S. Railway at Crewe." May I point out that this statement is not quite accurate having regard to the reconditioning work which is undertaken at this College. I enclose herewith a copy of the syllabus, and a reference to the rehabilitation course on pages 3 and 7 will show that activities are by no means limited solely to vocational training. On the contrary, provision for reconditioning has been an important element of the College work since it was opened in 1934, and the Training Committee are of opinion that such provision will always be more satisfactorily made in a place where vocational training is also carried on. It is by using the facilities available in connexion with the latter that remedial work of a varied nature is made available in those cases where reconditioning only is required.

Law and Theories of Evolution

Dr. H. WILFRED EDDISON (Exeter) writes: There has recently been a considerable amount of discussion on the validity or otherwise of the law of evolution, and many examples of muddled thinking have arisen. One is seen in the confusion between the law of evolution, on the one hand, and theories of evolution put forward, on the other, to account for its physical mechanism, none of which is completely adequate. The law of evolution and the theories of evolution are not synonymous terms. Even greater confusion is shown in the failure to distinguish between form and content, a distinction which Eddington is always so careful to make clear. The law of evolution is concerned solely with the form that mind has taken in the course of its development through the ages. The content of evolution, what mind often we hear criticisms of the law of evolution on the ground that it is hostile to a religious belief in the content of what is evolved. To criticize in terms of content a law which relates only to form does not seem to make sense. Science, being confined to form, has nothing to say regarding content. Yet how many people fail to realize that the scientist freely admits this! The Church, by its recent definition of its attitude towards the law of evolution, has shown its comprehension of this point, yet it has drawn upon itself adverse criticism based upon the two points of confusion referred to.

mouth, pharynx, and larynx. In 371 cases turbinectomy was performed. Treatment was prematurely discontinued by forty-six patients. Of the remaining 389 as many as 337 (86.6 per cent.) were cured. Relapses or recurrences of the disease in new sites occurred in thirty cases, twenty-four ending in recovery. Referring to another series of cases in the Finsen Institute with a longer observation period, the author states that 92.3 per cent. were cured. He finds that the recovery rate for cases of lupus of the mouth and respiratory tract, given rational treatment, is better than that for lupus of the skin, and he expresses approval of the system of treating skin and mucous membrane lupus in separate departments—dermatological and laryngological—provided there is co-operation between the two. With regard to the rarity of lupus of the tongue, he notes that among the first 2,000 cases of lupus coming to the Finsen Institute there were only fifteen in which the tongue was involved, and in none of these was the disease limited to this structure. He is, indeed, sceptical as to the existence of primary lupus of the tongue.

131 Lipstick Dermatitis

F. F. HELLIER (*Brit. J. Derm. Syph.*, November, 1937, p. 485) discusses lipstick dermatitis and reports two cases. He points out that very few cases have been recorded since the first, which was in 1905. His first patient was a woman aged 23, of dark complexion, who developed lipstick dermatitis the day after long exposure to the sun. Patch tests with six lipsticks gave positive reactions in four cases, doubtful reactions in two. The application of one of the latter to her lips produced signs of irritation. The lipsticks were analysed, and she was found to be sensitive to the eosin content. The second case was that of a woman aged 27, of fair complexion. She had lent her lipstick to the first patient for test purposes. This patient was not sensitive to lipsticks containing eosin, but to some other substance in her own lipstick, and, for some inexplicable reason, only after it had been lent to the first patient. Hellier points out that in this condition the patient notices itching, swelling, and even vesication of the lips in from two to twenty-four hours after the application of the lipstick, and that when it is not applied the condition clears up in less than ten days. In severe cases the surrounding skin, the eyes, and the tip of the tongue may also be affected. The trouble is not necessarily produced by the first application of the lipstick. Cases do not occur often in dermatological practice, because the cause is so obvious that the patient changes her lipstick. The main parts of a lipstick are its base, some perfume, and the colouring matter, and the main constituents of a typical base are beeswax, paraffin, stearic acid, cetyl alcohol, spermaceti, lanolin, lard, cocoa butter, and castor oil, all of which are recognized as occasional skin irritants. Perfumes vary from geranium essence to a mixture of as many as twenty-five ingredients, some natural, others synthetic. The colour usually includes eosin because it produces an indelible effect by staining the horny layer. Those used alone or together include rhodamine, tolu-safranin, rouge P 1566, ponceaux, erythrosine, geranium red, carmine, fuchsin, and phloxin. The author mentions an original theory that eosin acts as a photosensitizer and the dermatitis is precipitated by exposure to the sun. He considers that this may be so in a few instances, but that, generally speaking, the patient is simply unusually sensitive to the lipstick because of some temporary extraneous accident.

132 Diagnosis of Lichen Planus

G. MILIAN (*Rev. franç. Derm. Vénéreol.*, June, 1937, p. 306) describes a sign which he claims to be useful in distinguishing certain cases of lichen planus from psoriasis. A young woman patient showed a scaly eruption which at first sight appeared to be psoriasis. On scraping the patches with a curette he provoked an

abundant desquamation of silvery scales exactly as in a case of psoriasis. On continuing the scraping, instead of disclosing small bleeding points, as in psoriasis, he laid bare a dry surface on which was seen a marked, lilac-coloured reticulum, which is characteristic of lichen planus. The author states that this sign has not previously been described.

133

Scleroderma

TOURAINÉ, GOLÉ, and SOULIGNAC (*Ann. Derm. Syph.*, Paris, October, 1937, p. 761) point out that under the common title of scleroderma a number of widely differing syndromes are included. They seek to define these syndromes more accurately, to indicate their interrelationship, and to place them under subtitles of the group. They discuss particularly scleroedema, oedematous scleroderma, and oedematous sclerema, and suggest they should all be grouped together as "extensive benign sclerodermiform cellulitis." This condition is most common in Germany, especially since the war. Twice as many women as men are affected, and 50 per cent. are under 25 years of age. It usually follows an acute infective process, especially one affecting the mouth or pharynx or the skin itself, after a lapse of from three to twenty-one days, there being no symptoms during this incubation period beyond fatigue, malaise, or anorexia. The disease manifests itself as an oedematous infiltration of the skin and of the subcutaneous tissue of that part of the skin which shares the lymphatic drainage of the originally infected area, usually the nape or sides of the neck. The swelling spreads with varying speed, forming over the shoulders a cape of smooth or slightly roughened skin, with only an occasional pink, cyanotic, or brown coloration. There is a hard, non-splitting, waxy oedema with an indefinite edge and no changes in sensation other than a stiffness leading to hindrance of movement. The skin loses its wrinkles, cannot be picked up from the subcutaneous tissue, and on the face produces a mask-like effect. The scalp, hands, feet, and skin appendages are unaffected. There is no fever, but a constant finding is a lymphocytosis of 30 per cent. or more. Muscles and fasciae are occasionally affected, with swelling, diminished electrical excitability, and, later, wasting. The condition subsides in three to twelve months. Biopsy shows a perivascular infiltration by lymphocytes and plasma cells, dilatation of the lymphatics and degeneration of the collagen bundles. Many forms of treatment have given variable results, and as the condition naturally subsides no specific therapy can be suggested.

134 A. W. DURYEE and I. S. WRIGHT (*Amer. Heart J.*, November, 1937, p. 603) report good results in the treatment of scleroderma by means of acetyl-beta-methylcholine chloride (mechylol) iontophoresis. They hold that this treatment produces softening of the thickened skin as well as vasodilatation. Thirty-four patients were treated by this method. All but one showed vasomotor disturbances. Of the patients 76.5 per cent. were females; the average age was 37.9 years. Hands were more frequently involved than feet, and disability ranged from total incapacity to a slight stiffness of the fingers. Capillary examination usually showed large dilated loops typical of a Raynaud's syndrome. Seventeen patients had trophic ulcers, but none had gangrene involving more than two square centimetres. The drug was applied in the form of a 0.5 per cent. solution on an asbestos bandage over the affected areas, and the positive electrode of a galvanic battery was placed on the bandage; 20 mA of current was allowed to flow for twenty or thirty minutes during each treatment. Systemic reactions may occur, such as sweating, salivation, a fall in blood pressure, and increased intestinal peristalsis. Locally a marked vasodilatation appears, so that an area of rubor persists for several hours. Fifty or more treatments are usually necessary to obtain good results. All cases receiving thirty or more

Therapeutics

126

Undulant Fever

A. M. SNELL and T. B. MAGATH (*Proc. Mayo Clin.*, August 25, 1937, p. 542) report the successful treatment by typhoid vaccine of undulant fever in an elderly female, who, on account of her age, hypertension, cardiovascular state, and general debility, was considered to be unsuitable for treatment with specific antiserum or by fever therapy. Agglutination tests were strongly positive for *Brucella abortus* and negative for typhoid, paratyphoid, and *Pasteurella tularensis*. Two intravenous injections of combined typhoid vaccine were given at an interval of four days, each being followed by a chill, a rise in temperature, prostration, and sweating. Three days after the second injection the temperature became normal and remained so. Because of the dehydration and disturbed metabolism sodium chloride and water were given daily, intravenously and by mouth, along with suprarenal cortical hormone. As a result of the treatment the undulant fever was cured and the patient's general condition improved. The authors consider that typhoid vaccine therapy may be particularly suited to elderly patients with vascular disease, and stress the importance of maintaining the normal levels of body fluids and sodium chloride content in such cases.

127 Detoxicating Action of Sodium Thiosulphate

H. WENDT (*Dtsch. med. Wschr.*, December 3, 1937, p. 1832) states that the therapeutic virtues of sodium thiosulphate were first discovered in the latter part of the last century. The textbooks of that period credited this drug with a useful action in several fields—as a gargle in diphtheria, as a lotion to hasten sluggishly healing superficial wounds and fistulae, as a remedy for parasitic skin diseases, including scabies, and internally as a check on excessive fermentation in the stomach, and in typhoid and other fevers. The author considers the drug useful in three main ways: (1) superficially, by virtue of the generation of sulphur in the nascent state, in skin diseases of parasitic origin; (2) internally as a chemical antidote to such poisons as prussic acid; (3) internally, by virtue of its detoxicating action, in several allergic conditions reflecting disorders of metabolism. He has found intravenous injections of a preparation of this drug put up in ampoules effective in various skin diseases of an allergic character.

Dermatology

128 Skin Lesions due to Circulatory Disease

E. D. TELFORD (*Arch. Derm. Syph.*, Chicago, November, 1937, p. 952) discusses the skin lesions found in circulatory diseases. He points out that continued circulatory deficiency leads to fibrosis, and classifies his cases into a chilblain group, with subacute localized lesions which eventually heal, and a group characterized by slow, progressive interstitial fibrosis. The first lesions are well seen in cases of old anterior poliomyelitis or in erythrocyanosis. In a child affected with acute anterior poliomyelitis at 2 the first changes will probably be noticed at about the age of 10. Where the patients belong to the poorer classes, and have little chance of keeping the limb warm and well-cared for, it becomes cold and cyanotic with small, reddish-purple, firm, painful, tender nodules, which are situated just beneath the skin and are adherent to it. They usually appear in the lower half of the posterior aspect of the leg, at first in winter only, later in both winter and summer, and during the second winter small, clean-cut ulcers with fawn-coloured sloughs may form and take months to heal. The main factors

in the production of this condition are a defective venous return, a relatively small arterial inflow, and local cold. The deep purple cyanosis, due to defective venous return, results from loss of voluntary muscle action. In such cases the external iliac artery may be no larger than the radial artery, and the affected limb, if placed in an electrically heated cradle, warms quickly and cools slowly because of the defective circulation. In erythrocyanosis there is a reddish-purple discoloration, with roughness and coldness to the touch of the skin over the malleoli; the skin is blanched by pressure. Nodules occur in the subcutaneous tissue, and either resolve in several weeks or occasionally ulcerate. The main symptoms are sensations of weight, coldness in the leg, itching, and burning pain. Patients are usually of the sturdy, stout, and florid type. Telford considers that Bazin's disease is in no way different from erythrocyanosis and is not tuberculous, and that in four cases referred to him for examination there was no evidence of tuberculosis. The main histological features in the nodules seen in Bazin's disease, erythrocyanosis, and anterior poliomyelitis are thickening of the smaller arterioles, the presence of numerous giant cells, and necrosis and fibrosis almost exactly similar to that due to fat necrosis in the breast. Telford suggests that the giant cells containing fat may result from the presence of the fat-splitting ferment in the blood. He has had satisfactory results with lumbar sympathectomy in fourteen cases of anterior poliomyelitis with ulceration of the nodules, and in nineteen of the erythrocyanotic type. The second group includes cases of acrosclerosis and sclerodactylia. The earliest evidences of the affection are asphyxial and cyanotic attacks which later lead to arterial thrombosis. There is often osteoporosis and the subcutaneous deposition of calcium. The skin at first is thick and leathery, but later becomes tense, thin, and shiny. Painful ulcers develop at prominent points; the nails are small and deformed, the hand claw-like, and the face is also affected. Cervico-dorsal ganglionectomy in eight cases gave promising results.

129 Benzyl Benzoate Treatment of Scabies

A. VELLIN (*Rév. franç. Derm. Vénéréol.*, July-August, 1937, p. 351) reviews the treatment of scabies with benzyl benzoate. Patients are soaped well, bathed, and the anti-itch lotion applied to the skin with a stiff brush, particularly at the usual sites of infection. The lotion is allowed to dry on for two or three minutes, and the application is then repeated. This usually kills all parasites, and it is best not to repeat the treatment for at least a week. Out of 112 cases dealt with in this way, 103 were permanently cured in twenty-four hours. As a result of the investigation he considers that benzyl benzoate is the ideal acaricide. Its penetrative powers are increased by soap and alcohol; it has a more rapid action than even balsam of Peru. The application by means of a brush is much less unpleasant and messy than those techniques which involve inunction, and therefore patients can easily be treated in their own homes. The alcoholic mixture does not appear to irritate the skin or produce any toxic effects, and can be used with safety on adults with delicate skins, pregnant women, and children, and even on cases with a moderate degree of secondary infection.

130 Lupus of the Nose and Throat

O. STRANDBERG (*Ugeskr. Laeg.*, November 4, 1937, p. 1163) reports from the Finsen Institute in Copenhagen the results he has achieved in cases of lupus of the nose and throat treated with universal carbon arc baths, supplemented, when the disease was localized, by the excision of small foci. When the condition was more extensive, fulguration, electrocoagulation, or galvanocauterization was prescribed. The lower turbinates were always removed when involved, in order to facilitate treatment of the structures beneath them. In the period 1913 to 1921 there were 435 new patients treated for lupus of the nose,

A Triumph of Emulsification

THE OILY RING AROUND
THIS DROP TELLS THE STORY

The ring around the drop tells the story. A drop of Agarol on blotting paper holds firmly together. Try this with a poor emulsion and you will soon see the mineral oil being taken up by the blotting paper, forming a greasy ring around the drop. For dependable efficacy in the treatment of constipation and allied disorders Agarol—mineral oil, agar-agar and

phenolphthalein emulsion—has attained a reputation all its own.

Only the finest and purest ingredients are used in Agarol. Its exceptional palatability, secured without artificial flavouring, renders it acceptable to both children and adults. Agarol contains no alcohol and no alkali and, being devoid of sugar, is particularly suited to diabetic cases.

Agarol
BRAND COMPOUND
FOR CONSTIPATION

Supplied in bottles containing 4½, 7½ and 17 ounces.

Agarol is not advertised to the public.

William R. Warner & Co. Ltd., Power Road, Chiswick, London, W.4.

treatments showed either marked or moderate improvement. Improvement is not confined to the treated area, but is seen in all areas affected by the scleroderma. Good results noted are: restoration of normal function; healing of ulcers; softening and loosening of skin; and return of sweating and of hair. The injection of 1/150 grain of atropine will produce a cessation of the mechoyl effects. For various reasons it is not advisable to give the drug orally or parenterally.

135 Exudative Lymphatic Erythrodermia

C. MADERNA (*Rif. med.*, October 30, 1937, p. 1549) describes the case of a young woman, aged 22, who suddenly ceased to menstruate after a violent emotional shock, and four months later developed intense pruritus all over the body, which resisted all forms of treatment. A few days later a rash was observed on the abdomen and limbs, and this gradually assumed the appearance of a generalized exfoliative erythrodermia, complicated by eczematoid foci with more or less exudation; there was also oedema of the lower limbs, and rhagadoid fissures of the hands and feet. The inguinal, crural, axillary, and cervical lymph glands were all enlarged, discrete, and mobile. The hair of the head, the eyebrows and eyelashes were not affected, and both finger- and toe-nails were perfectly normal, but the pubic and axillary hair gradually fell out. The mucous membranes of the tongue, mouth, and pharynx were unaffected. The Wassermann, Meinicke, and Kahn tests were all negative. The father was known to be luetic, and a brother had died of tuberculosis at the age of 15. A series of blood counts showed leucocytosis (21,000 per c.mm.), lymphocytosis (48 per cent.), and the presence of Riedel type cells. There was practically no pyrexia at any time. The patient was treated with small repeated injections of maternal blood, intravenous injections of ascorbic acid, and ovarian preparations by mouth. Both the general and the local condition became very much worse at the beginning of the treatment, but after three weeks or so improvement set in very gradually. Seventeen months were required to bring about complete restoration to health. The author discusses the differential diagnosis, and, after setting aside subacute or chronic exfoliative erythrodermia of the Wilson-Brocq type and the pityriasis rubra of Hebra, decides that the case was one of exudative lymphatic erythrodermia.

Obstetrics and Gynaecology

136 Labour in Elderly Multiparae

F. SZOLNOKI (*Zbl. Gynäk.*, December 25, 1937, p. 2941), as evidence of the greater dangers of labour in elderly multiparae, quotes: (1) Leyland Robinson's finding that up to the fourth labour the risk is inversely proportional, after that directly proportional, to the number of labours; (2) similar evidence from Japan; (3) a Scandinavian report on the increasing incidence of forceps application from the fifth labour onwards. At a Budapest clinic successive births are not associated with longer labours or greater frequency of pregnancy toxicoses; but they bring some increase in the proportions of cases of placental retention and atonic bleeding, and a very notable increase in cases of placenta praevia and of transverse presentation. The maternal mortality is two and a half times as great in fifth to seventh pregnancies as in second to fourth pregnancies; the corresponding foetal mortalities are 4.16 and 2.16 per cent. respectively. The increasing incidence of complications and mortality (maternal and foetal) which accompanies increase in the parturient's age—apart from the number of her labours—is largely independent of those associated with the bearing of many children. The increased risk run by old multiparae is here attributed partly to social factors—poor nutrition,

over-fatigue, and poverty—and partly to imperfect supervision during pregnancy.

137 Ovaries and Hysterectomy

R. P. TREVINO (*Cirurg. Ciruj.*, November, 1937, p. 501) stresses the importance of preserving the ovaries whenever possible in cases undergoing hysterectomy. He refutes the suggestion of some authors that the ovaries cease to have any endocrine function after the removal of the uterus, and draws attention to the favourable results obtained by means of grafts. Among other effects of bilateral oophorectomy are a rise in blood pressure, vasomotor disturbances, and psychic disorders of various kinds which may even go on to actual mania. This happened to one of his own patients from whom he removed the ovaries seven years ago. He gives a detailed account of ten cases in which he performed hysterectomy for various reasons, leaving the ovaries *in situ*. None of these patients, whom he was able to follow up for some years, had any menopausal symptoms, although in some of them the ovaries at the time of the operation seemed incapable of performing any useful function. The cases include six of fibromyomata, two of double pyosalpinx, one of double hydrosalpinx, and one of pelvic peritonitis after an abortion at the third month.

Pathology

138 Biological Assay of Liver Extracts

R. EGE and E. HAGENS (*Acta path. microbiol. scand.*, 1937, 14, 4, 597) report a study of Jacobson's method of standardizing liver extracts by observing the reticulocyte count in guinea-pigs after injecting the extracts. In addition to the theoretical objections that the guinea-pigs used are normal and not anaemic, and that the rise in their reticulocyte count is not specific for liver extract since it may be produced by many other substances, the authors found experimental evidence that the method is unsatisfactory. In thirteen of one group of twenty-seven guinea-pigs the reticulocyte count was at times above 20 per 1,000 erythrocytes—the figure fixed by Jacobson for a positive response—and in all cases there were great variations in the reticulocyte count. In another series a change of diet produced a rise in reticulocytes, in some cases to above 20 per 1,000 erythrocytes. This was not due to the effects of salts or vitamins. In both series injections of a therapeutically active liver extract failed to produce a reticulocyte change differing from that occurring in untreated guinea-pigs. Morphologically the "shift to the left" in the reticulocytes, characteristic of the response to liver extract and of the new production of erythrocytes, was only seen a few times. The authors conclude that under the conditions indicated by Jacobson the method is not reliable.

139 Histidine and Oxygen Consumption

C. TARANTINO (*Sperimentale*, October, 1937, p. 463) mentions several reports of increased oxygen consumption by surviving liver, kidneys, and skin after the addition of various amino-acids. The reports concerning histidine are conflicting, probably because the concentration necessary has been insufficiently considered. His work shows that the normal or regenerating skin of rats, studied by Warburg's method, consumes more oxygen in the presence of histidine, especially in the molecular concentration of m/90 and with pH values of 5.8 to 6.1; at the same time the histidine is destroyed. The consumption of histidine and oxygen by the excised skin is increased by previous injections of histidine into the intact animal. Probably the skin, like the liver, contains a histidinase. Excess of histidine does not increase the rate of oxygen consumption, and may lead to its storage in the skin either as histidine or as histamine.

SALT'S PATENT KIDNEY CORSET

*is an efficient alternative to
the Belt form of support for
displaced or floating Kidney*

SALT

Only in the matter of style is Salt's Patent Kidney Corset different from the well-known Kidney Belt produced by this firm. The principles of design and the efficiency of the Corset are identical with those of the Belt. It will definitely retain the Kidney in its proper position and obviate symptoms due to dragging on the renal ligaments. It will diminish the danger of hydronephrosis consequent upon kinking of the ureter. Being individually made for the eventual wearer, the Corset is always completely comfortable throughout its long life. It can be made to almost any style stipulated by the patient. Measure/Order forms are contained in Salt's Corset and Belt Book—sent post free on request to Doctors who care to write for a copy.

VERNON-SPENCER HEARING AIDS 120 WIGMORE ST., LONDON W.1.

A Scientific Support giving GREATER FREEDOM

The special feature of the Curtis Abdominal Support No. 1 is its even anterior-posterior pressure. This support is acknowledged by Medical men to be one of the finest available owing to the permanent positive pressure exerted where it is most needed. Model No. 1 is light in weight, comfortable and gives complete freedom at all times to the hips. It is suitable in the treatment of all forms of abdominal ptosis-visceroptosis, enteroptosis and gastropptosis; and it is frequently recommended for support of ventral hernia and scar tissue in the lower abdomen.

"My patient finds this instrument THE BEST HE HAS TRIED"

writes a well-known Aurist

The range of models, all most moderate in price, includes types with carbon or crystal microphones, and with two or three stages of valve amplification; earpieces to choice. Pocket Model 52 P.L., illustrated, measures 6" x 5" x 1".

From every hand comes remarkable testimony to the exceptional merits of the Maxade Hearing Aids. Here is a recent letter from a user, L.A.L., of Erith, Kent, who writes:—

"I have suffered with partial deafness for 20 years. I have had two other instruments, and have tried five others. Only one of them could compare with the one I bought from your firm . . . and that was more than double the price."

FOCUSED TONE combined with sensitively-controlled sound amplification, using bone or air conduction, makes Maxade the nearest approach to natural hearing that can be secured. PRACTITIONERS and AURISTS are invited to apply for any Maxade Model for free clinical test.

ACOUSTICAL ENGINEERS SINCE 1919.

One can't discuss football now

One just *can't* discuss football and smoking at the same time, and do justice to either. So, here, we make no apology for talking facts about tobacco. Fact 1. WILLS' Cut Golden Bar has been on sale for the last 40 years—a long time. Fact 2. In spite of all the newer tobaccos, at about the same price, its popularity has steadily increased. Fact 3. There's nothing at all dramatic about it. The flavour is quite unobtrusive—hence smokers don't tire of it. Try it, and you'll see that this is so. You can get it in the Original form or Ready Rubbed—at 1/- an ounce.

W.D. & H.O. Wills.

WILLS' CUT GOLDEN BAR

Modern Iron Therapy

Iron 'Jelloids' are an elegant and reliable means of administering the protocarbonate of iron. The preparation has none of the disadvantages of Pil. Blaud. The iron content remains fresh and unoxidized indefinitely, and

injury to teeth is avoided.

The 'Jelloids' are highly effective in the treatment of achlorhydric anaemia and indeed in all the simple anaemias in which massive iron therapy is indicated.

Iron Jelloids

You are cordially invited to apply for samples for clinical test.
The Iron 'Jeloid' Company, Ltd., King George's Avenue, Watford, Herts.

IN CASES OF CHEST COLD, BRONCHITIS, ASTHMA, WHOOPING COUGH, SPASMODIC CROUP, and similar respiratory affections, Vapo-Cresolene brings relief. The germicidal vapour clears air passages and soothes paroxysms. Used at night during sleep, it helps the patient to obtain undisturbed rest. Vapo-Cresolene is specially prepared from creosoles of coal tar and has a reputation of 57 years standing. It is invaluable for the treatment of children. Laboratory tests, by a research laboratory of unquestioned standing, show that the vapours produced from Vapo-Cresolene by the

Cresolene Vaporiser exert a direct germicidal action when in contact with moist surfaces harbouring pathogenic bacteria associated with respiratory affections.

The problem of SURGICAL STOCKINGS

Doctors who prescribe Compri-Vena Stockings are sure that the most beneficial support is given as each one is made to the patient's measurements and needs. They have long been recommended for Varicose veins and in conjunction with Injection Treatment as well as during and after Pregnancy. They are also invaluable in relieving undue leg strain. Compri-Vena Stockings are rubberised and yet elastic, are washable, cool in wear and invisible under ordinary silk stockings. They give real relief and preserve the shape of the legs. A skilled staff carefully follow all doctors' instructions. Full details from:

PISTANY MUD for RHEUMATISM

TREATMENT SERVICE in operation

An ideal source of Heat, Radio-Activity and Sulphuric Compounds is supplied by hot PISTANY SPA MUD which is therefore obviously of great value in cases of Rheumatic Disorders. Besides treatment facilities in Hospitals and Clinics, a service is in operation providing the treatment in private centres and patients' homes on medical prescription.

PISTANY SPA MUD

can also be supplied to the patient with detailed instructions for self-treatment. Simple and clean to apply, the cost of home treatment is well within the reach of patients of moderate means, e.g., a 12 - packet of Pistany Mud is sufficient for a course of 12 treatments for the medium-sized joint. CHILBLAIN

cured in 36 hours

Striking testimony to Sphagnol Peat Ointment

Since few people can stop working because of chilblains some effective local treatment is essential. Sphagnol soothes and cools chilblains with the first dressing. And concerning Sphagnol's effectiveness, a doctor has written: "I found the preparations you sent me remarkably good, especially the ointment, which

cured an intractable chilblain in 36 hours." Signed —, M.D. Test Sphagnol personally. On receipt of a postcard we shall be pleased to send you a sufficient supply.

The above House, which was established in 1826, is an Institution for the care and treatment of persons suffering from mental diseases and nervous disorders. Certified-voluntary and temporary patients are received. Separate houses for treatment and accommodation of special cases adjoin the Institution. There is a seaside branch, Kearsney Court, near Dover, to which patients may be sent for treatment or on holiday. Motor and carriage exercise is provided as required. Patients can avail themselves of a course of physical drill. Tennis courts. Entertainments, dances, and indoor amusements held throughout the year. Terms from £3 3s. per week. Illustrated prospectus and further particulars can be obtained from the Medical Superintendent.

CHEADLE ROYAL HOSPITAL

CHEADLE, CHESHIRE

This REGISTERED HOSPITAL, with a SEASIDE BRANCH at Colwyn Bay, N. Wales, is for the treatment and care of those of the Upper and Middle Classes suffering from MENTAL and NERVOUS DISEASES.

The Hospital is governed by a Committee appointed by the TRUSTEES of the Manchester Royal Infirmary. In addition to the Main Building there are separate villas. Extensive grounds. Hard and grass tennis courts, cricket and croquet grounds, and a court for badminton. There are also wireless installations. Golf may be had within easy distance. Occupational therapy.

VOLUNTARY, TEMPORARY, AND CERTIFIED PATIENTS received.

The Hospital is nine miles from Manchester, 50 minutes by rail from Liverpool, and 31 hours from London.

For terms and further particulars apply to the Medical Superintendent, who may be seen in MANCHESTER by APPOINTMENT.

The Convalescent Branch is HOVE VILLA, BRIGHTON, and is 200 feet above sea-level.

ST. ANDREW'S HOSPITAL FOR MENTAL DISORDERS NORTHAMPTON

FOR THE UPPER AND MIDDLE CLASSES ONLY

President: THE MOST HON. THE MARQUESS OF EXETER, C.M.G., A.D.C.

This Registered Hospital is situated in 120 acres of park and pleasure grounds. Voluntary patients, who are suffering from incipient mental disorders or wish to prevent recurrent attacks of mental trouble, temporary patients and certified patients of both sexes, are received for treatment. Careful clinical, biochemical, bacteriological, and pathological examinations. Private rooms, with special nurses, male or female, in the Hospital or in one of the numerous villas in the grounds of the various branches can be provided.

WANTAGE HOUSE

This is a Reception Hospital in detached grounds, with a separate entrance, to which patients can be admitted. It is equipped with all the apparatus for the most modern treatment of Mental and Nervous Disorders. It contains special departments for hydrotherapy by various methods, including Turkish and Russian baths, the prolonged immersion bath, Vichy Douche, Scotch Douche, Electrical bath, Plombières treatment, etc. There is an Operating Theatre, a Dental Surgery, an X-ray room, an Ultra-Violet Apparatus, and a Department for Diathermy and High Frequency treatment. It also contains Laboratories for biochemical, bacteriological, and pathological research.

MOULTON PARK

Two miles from the Main Hospital there are several branch establishments and villas situated in a park and farm of 650 acres. Milk, meat, fruit, and vegetables are supplied to the Hospital from the farm gardens and orchards of Moulton Park. Occupation Therapy is a feature of this branch, and patients are given every facility for occupying themselves in farming, gardening, and fruit growing.

BRYN-Y-NEUADD HALL

The seaside house of St. Andrew's Hospital is beautifully situated in a park of 330 acres, Llantairfechan, amidst the finest scenery in North Wales. On the North-West side of the Estate, a mile of sea coast forms the boundary. Patients may visit this Branch for a short seaside change or for longer periods. The Hospital has its own private bathing house on the seashore. There is trout-fishing in the park.

At all the branches of the Hospital there are cricket grounds, football and hockey grounds, lawn tennis courts (grass and hard courts), croquet grounds, golf courses, and bowling greens. Ladies and gentlemen have their own gardens, and facilities are provided for handicrafts, such as carpentry, etc.

For terms and further particulars apply to the Medical Superintendent (Telephone No. 2356 and 2357 Northampton), who can be seen in London by appointment.

THE COPPICE, NOTTINGHAM

HOSPITAL FOR MENTAL DISEASES

This Institution is exclusively for the reception of a limited number of Private Patients of both sexes of the Upper and Middle Classes at moderate rates of payment. It is beautifully situated in its own grounds on an eminence a short distance from Nottingham, and from its singularly healthy position and comfortable arrangements affords every facility for the relief and cure of those mentally afflicted. Occupational Therapy, Voluntary and Temporary Patients received.

Tel.: 64117. For terms, etc., apply to the Medical Superintendent.

THE GROCERS' COMPANY OFFER EACH YEAR

ONE SCHOLARSHIP for the encouragement of the RCH into the study of DISEASE or as PREMATURE DEATH. The award, which is tenable for two years from September 1st, is of £300 for the first year and £450 for the second year, in addition to which the Court will grant up to £150 a year towards the cost of special apparatus, etc., required by the scholar. Candidates should not be more than 35 years of age, and should submit their applications to the undersigned before May 1st.

L. HICKMAN BARNES, Clerk.
Grocers' Hall, E.C.2.

ROYAL NAVAL MEDICAL SERVICE.

Vacancies exist for Medical Officers in the Royal Navy, and applications are invited for entry in April, 1938.

Candidates below the age of 28 years are preferred, and they must be registered under the Medical Acts. No examination in professional subjects will be held, but candidates will be required to attend for interview by a Selection Board.

Selected candidates will be entered for Service for a period of three years in the first instance, which may be extended to five years at the discretion of the Admiralty.

At the end of three years' service officers may retire with a gratuity of £400, but those who serve for five years will receive £1,000.

At the end of five years' Short Service permanent commissions will be given to selected officers who wish to make the Naval Medical Service their permanent career. Officers transferred to the permanent list will receive a gratuity of £1,000 (less Income Tax).

Opportunities are available for officers on the permanent list to specialise, and ample provision is made for Post-Graduate study.

Copies of the regulations for entry and conditions of service, including rates of pay and allowances, may be obtained from the Medical Director-General of the Navy, Admiralty, S.W.1, and from the Deans of all Medical Schools.

Applications for entry from intending candidates must be received not later than February 28th, 1938.

ROYAL AIR FORCE MEDICAL SERVICE.

Applications are invited from medical men for appointment to commissions in the Medical Branch of the Royal Air Force for entry in May, 1938.

Candidates must be of pure European descent. They must be British Subjects, the sons of British Subjects and registered under the Medical Acts.

Candidates must normally be under 28 years of age but as a temporary measure consideration will be given to candidates up to 31 years of age and will be selected after interview by a selection board without competitive examination.

Hospital appointments held since qualifying will, under certain conditions, qualify candidates for antedate of commission up to a maximum of one year; the age on entry may, if necessary, be increased by a period equal to the "antedate."

Selected candidates will be appointed to short service commissions (for three years extendible to five years) followed by four years' service in the Reserve, and will be eligible to be considered for Permanent Commissions after having completed their first year of service and during the whole period of their service on the active list. Officers selected for Permanent Commissions will be allowed to count their service on a short service commission towards retired pay or gratuity to permanent officers. Officers not selected for Permanent Commissions receive gratuity as follows on transferring to the Reserve:—

On completion of three years, £400. On completion of five years, £1,000.

Copies of the regulations for entry and conditions of service, including rates of pay and allowances, also form of application, may be obtained on application from:—The Secretary, Air Ministry (D.M.S.), Adastral House, Kingsway, W.C.2.

Completed applications from intending candidates for the vacancies in May, 1938, must be received in the Air Ministry not later than March 15th, 1938.

THE BRITISH MEDICAL JOURNAL

POST-GRADUATE COURSE IN VENEREAL DISEASES

LONDON COUNTY COUNCIL
(WHITECHAPEL) CLINIC,
TURNER STREET, E.1 (ADJOINING THE
LONDON HOSPITAL).

A THREE MONTHS' COURSE OF INSTRUCTION in MODERN METHODS OF DIAGNOSIS and TREATMENT OF VENEREAL DISEASES will be given by Lieut.-Colonel E. T. BURKE, D.S.O., the Director of the Clinic, during March, April and May, 1938. Attendance at this course will qualify, subject to the other conditions in the Regulations of the Ministry of Health, for the Certificate enabling the possessor to hold the post of a Venereal Diseases Officer under the Council of a County or County Borough. The course will consist of twenty-five systematic lectures, accompanied by lantern demonstrations, on Mondays and Thursdays at 2.30 p.m., beginning on February 28th and ending on May 26th. Every Wednesday at 2 p.m. cases will be demonstrated. Those taking the course will also attend the practice of injections, etc. During the three months 130 hours of attendance must be put in.

Those intending to take the course must send their names to the Director on or before February 21st, 1938. Fee: £10 10s.

THE UNIVERSITY OF MANCHESTER

SIR HENRY ROYCE RESEARCH FELLOWSHIP.

Applications are invited for the SIR HENRY ROYCE RESEARCH FELLOWSHIP, founded under the Will of the late Sir Frederick Henry Royce, Bart. The Fellowship, for research on either "THE COMMON COLD, its nature, prevention, and cure," or "INFLUENZA, its nature, prevention, and cure," is of the value of £500 per annum, and will be tenable in the first instance for a period of three years. Applicants must be graduates of a British University or otherwise registered Medical Practitioners or subjects qualified to undertake research in forms of application specified. Further particulars from the Registrar, the University, Manchester, 13.

All applications, to be made on a prescribed form, must be sent to reach him not later than February 28th.

Further particulars may be obtained from: Dr. A. E. Clark-Kennedy, M.D., F.R.C.P., Dean, London Hospital Medical College, Turner Street, London, E.1.

GUY'S HOSPITAL MEDICAL SCHOOL

FINAL FELLOWSHIP COURSE.

The next COURSE OF INSTRUCTION for the preparation for the FINAL EXAMINATION for the FELLOWSHIP OF THE ROYAL COLLEGE OF SURGEONS OF ENGLAND will commence on MONDAY, FEBRUARY 21st. Intending applicants for admission to the Course should communicate with the Dean, Guy's Hospital Medical School, London Bridge, S.E.1.

THE QUEEN'S UNIVERSITY OF BELFAST.

LECTURER IN ANATOMY.

Applications are invited by Wednesday, March 2nd, 1938, for the post of LECTURER IN ANATOMY, at a salary of £450 per annum, with contributory pension; the duties of the lecturer will include teaching in Embryology to Medical and Science students; duties to be obtained from RICHARD H. HUNTER, Secretary, Queen's University, Belfast.

February 3rd, 1938.

UNIVERSITY OF LONDON.

The Senate invite applications for the UNIVERSITY READERSHIP IN EMBRYOLOGY, tenable at University College. Salary £750 a year. Applications (12 copies) must be received not later than first post on March 4th, 1938, by the Academic Registrar, University of London, W.C.1. from whom further particulars should be obtained.

UMTATA HOSPITAL BOARD.

SIR HENRY ELLIOT HOSPITAL.

APPOINTMENT OF SENIOR RESIDENT MEDICAL OFFICER.

Applications are invited from qualified Registered Medical Practitioners for the above-mentioned post. The salary attached to this position, which is whole-time, is at the rate of £600 per annum, plus free house, water, light and sanitation. A double-storied dwelling-house is shortly to be erected in which the successful applicant will be required to reside, but pending its completion he will be allowed an amount of £10 per month in lieu of quarters and incidental costs.

The successful applicant is to assume duty on July 1st, 1938, and to enter into contract of service for three years (which may be renewed), the first year to be on probation.

The Hospital has 154 beds (22 European, 132 Native), but this accommodation will be increased by approximately 60 beds in the near future. Duties include assisting at operations, anaesthetics, radiology, the general ward work of a resident medical officer, lecturing to nurses, and the general superintendence of the whole Hospital.

Applicants to state full particulars of: (1) Their Medical and, in particular, Radiological and Surgical experience.

(2) Nationality, age, and whether married or single.

(3) Whether fully conversant with both English and Afrikaans.

Applications, with copies of three recent testimonials and health certificate, must be lodged with the undersigned not later than noon on March 15th, 1938.

C. E. BEVAN, Secretary.

Umtata, Cape Province, South Africa.

THE UNIVERSITY OF LIVERPOOL.

The Council invites applications for the following posts:—Two DEMONSTRATORSHIPS (ungraded) in PHYSIOLOGY. Salary £300 per annum. The appointments will take effect as from October 1st, 1938.

Applications should be received by the undersigned not later than April 1st, 1938, from whom further particulars may be obtained.

STANLEY DUMBELL, Registrar.

February, 1938.

BOROUGH OF GRAVESEND.

ASSISTANT MEDICAL OFFICER OF HEALTH AND SCHOOL MEDICAL OFFICER.

Applications for this appointment are invited from registered medical practitioners of not more than forty years of age; commencing salary £600 per annum, rising by two annual increments of £50 to a maximum salary of £700 per annum. Candidates must have had at least three years' professional experience and special Child Welfare Ante-Natal and Maternity and School Medical Service work, and the work of the School Medical Officer and Oculist. The possession of a Diploma in Public Health is necessary.

The person appointed will be required to devote full time to the duties, and not to engage in private practice. Duties to be performed under the direction of the Medical Officer of Health, and to include work in connection with Air Raid Precautions.

The post will be designated as established for the purposes of the Local Government and Other Officers' Superannuation Act, 1922, and the usual deduction of 5 per cent. will be made from salary. The successful candidate will be required to pass a medical examination by the Medical Officer of Health or an independent medical referee appointed by the Council.

Applications must be made on forms obtainable from the undersigned, to whom they must be returned (accompanied by copies of three recent testimonials) not later than the first post on Monday, February 28th, 1938, in envelopes endorsed "Assistant Medical Officer."

Canvassing, directly or indirectly, will disqualify. H. H. BROWN, Town Clerk's Office.

4, Woodville Terrace, Gravesend. February 7th, 1938.

CITY OF SHEFFIELD.

CITY GENERAL HOSPITAL.

JUNIOR ASSISTANT MEDICAL OFFICER.

Applications are invited from duly qualified medical men for the appointment of Junior Assistant Medical Officer at the above hospital. The Medical Officer appointed will be required to take duty in the Medical, Surgical or Maternity Departments, as directed by the Medical Superintendent.

The appointment will be for one year only, and the salary offered is £200 per annum, with the usual residential allowances.

Previous hospital experience desirable. Applications, stating age, by not more than three testimonials of recent date, should be sent to the Medical Superintendent, City General Hospital, Sheffield, 5.

COUNTY COUNCIL OF MIDDLESEX.

RESIDENT CASUALTY MEDICAL OFFICER.

Applications are invited for the above appointment at West Middlesex County Hospital, Isleworth. Candidates must be registered medical practitioners who have held the post of both house physician and house surgeon at a general hospital, and have had considerable all-round experience.

Salary £350 per annum, with board, lodging and laundry, valued at £100 per annum.

The officer appointed will be required to deal with casualties and admissions to the hospital, and to carry out such other duties as may be allotted to him.

The appointment, which does not at present carry any superannuation rights, will be subject to medical examination, is for a period of six months in the first instance, and is terminable by an additional six months, and may be extended for one month's notice on either side.

The officer appointed will work under the direction of the Medical Superintendent and will devote his whole time to official duties.

Applications, stating age, qualifications, and experience, together with copies of not more than three recent testimonials, must be received by the undersigned not later than February 26th. Envelopes must be endorsed "Casualty Medical Officer, West Middlesex County Hospital." Relationship to any member or officer of the Council must be disclosed in the application.

Canvassing, directly or indirectly, will be a disqualification.

C. W. RADCLIFFE, "Z," Clerk of the County Council.

Middlesex Guildhall, Westminster, S.W.1.

February 1st, 1938.

CANNOCK URBAN DISTRICT COUNCIL.

APPOINTMENT OF ASSISTANT MEDICAL OFFICER OF HEALTH AND ASSISTANT SCHOOL MEDICAL OFFICER.

The above Council invites applications from registered medical practitioners, of under 35 years of age, for the above-named post. The salary will be at the rate of £550 per annum, rising, subject to satisfactory service, by annual increments of £25 to £700 per annum. Applicants must have had at least three years' experience in the practice of their own profession and special experience of practical midwifery, ante-natal, and Maternity and Child Welfare work, and hold a diploma in Public Health.

The person appointed will be required to devote the whole of his or her time to the duties, which will be performed under the direction of the Medical Officer of Health, and will consist chiefly of School Medical and Maternity and Child Welfare work, together with such other duties relating to Public Health as may be required.

The appointment is subject to the approval of the Board of Education, and will be determinable by one month's notice on either side.

The Council has, subject to the approval of the Ministry of Health, decided to adopt the Local Government and Other Officers' Superannuation Act, 1922, as from April 1st, 1938, and the successful candidate will be required satisfactorily to pass a medical examination.

Sealed applications, on forms to be obtained from the undersigned (upon receipt of a stamped envelope), accompanied by copies of three recent testimonials, and endorsed "Assistant Medical Officer of Health," must be delivered to the undersigned not later than Wednesday, February 23rd.

Canvassing, directly or indirectly, will be deemed a disqualification.

WM. C. SPEEDY, Clerk of the Council.

Council House, The Green, Cannock.

February, 1938.

JOINT COMMITTEE OF THE COUNTY COUNCILS OF DURHAM AND NORTHUMBRIA AND THE COUNTY BOROUGH COUNCILS OF GATESHEAD AND NEWCASTLE-UPON-TYNE.

HOUSE SURGEON AND JUNIOR CLINICAL ASSISTANT (Male, non-resident).

Applications are invited from duly qualified Medical Practitioners for the post of House Surgeon and Junior Clinical Assistant to the Joint Committee's Venereal Diseases Clinic and associated beds in the Newcastle General Hospital. Duties include assistance in the male and female out-patients' departments and in the in-patients' departments, and commence April 1st, 1938. Appointment is tenable for one year. Salary £250 per annum, plus an allowance of £100 per annum in lieu of residential emoluments. (Lunch and tea will be provided when on duty.) Applications, stating age, nationality, qualifications, special experience in Venereal Disease work (if any) should be forwarded to Dr. A. E. W. McLachlan, Clinical Medical Officer, Joint Committee's Clinic, Newcastle-upon-Tyne, 4, on or before February 26th, 1938.

CITY OF LEEDS

ASSISTANT MEDICAL OFFICER.

Applications are invited from qualified and registered medical practitioners for the post of Assistant Medical Officer for maternity and child welfare. Applicants must have had not less than three years' postgraduate experience, including experience in general medicine and surgery, and special experience in obstetrics and ante-natal work, and in the treatment of children's diseases and disease of women. Preference will be given to candidates possessing the D.P.H.

Under the present grading scheme of the Council, the commencing salary for the post is £200 per annum and the maximum salary £710, with annual increments of £25, subject to satisfactory service, and the first increment will take effect on April 1st, following the completion of twelve months' service.

The person appointed will be required to pass a medical examination, and to contribute to the superannuation fund established under the Local Government and Other Officers' Superannuation Act, 1922. The appointment will be terminable by one month's notice on either side.

Form of application and particulars as to the duties of the appointment may be obtained from the undersigned. Applicants endorsed "Maternity and Child Welfare Officer," together with copies of three recent testimonials, must be delivered at the Health Department, 12, Market Buildings, Vicar Lane, Leeds, 1, not later than 10.30 a.m. on Saturday, February 19th, 1938. Canvassing in any form, either directly or indirectly, will be a disqualification.

J. JOHNSTONE JERVIS,
Medical Officer of Health

COUNTY BOROUGH OF BLACKBURN

ASSISTANT MEDICAL OFFICER OF HEALTH.

Applications are invited for the post of Assistant Medical Officer of Health (male), whose principal duties will be to act as Clinical Tuberculosis Officer for the Town and Resident Medical Officer of the Corporation Hospital, in which cases of tuberculosis and other infectious diseases are treated.

Applicants must not be less than 25 years of age and, subsequent to qualification, shall (1) have had at least three years' experience in the practice of their profession, (2) have spent in general clinical work a period of not less than eighteen months, of which not less than six months have been spent in a hospital as resident officer in charge of beds occupied by renal medical or surgical cases, and (3) have received special training for a period of not less than six months in the diagnosis and treatment of tuberculosis.

Preference will be given to candidates who, in addition to the requirements mentioned above, hold a diploma in Public Health, and who have held a Resident post in an Infectious Diseases Hospital. The salary will be £600 per annum, together with board and residence. Married quarters are not available.

A form of application and list of duties may be obtained from the Medical Officer of Health, Public Health Officer, Victoria Street, Blackburn, to whom applications, together with copies of three recent testimonials, endorsed "Assistant Medical Officer of Health," should be sent not later than noon on Saturday, February 19th, 1938.

Canvassing, directly or indirectly, will be a disqualification.

Town Hall, CHAS. S. ROBINSON,
Blackburn. Town Clerk.
January 25th, 1938

NORFOLK COUNTY COUNCIL.

CLINICAL TUBERCULOSIS OFFICER.

Applications are invited for the appointment of a Clinical Tuberculosis Officer for the western area of the county. Applicants must have had considerable experience of tuberculosis, including diagnosis, treatment, and artificial pneumothorax treatment.

Salary £750 rising, on satisfactory service, by annual increments of £25 to £937 10s. 6d. Traveling expenses in accordance with the Council's scale will also be paid.

The officer appointed will be on the staff of the County Medical Officer, must reside at a centre approved by the Council and devote his whole time to the work.

The appointment will be terminable by three months' notice by either side. The post will be a designated one under the Local Government and Other Officers' Superannuation Act, 1922, and the successful applicant will be required to pass a medical examination.

Application forms can be obtained from the County Medical Officer, Public Health Department, 29, Thorpe Road, Norwich, to whom they must be returned not later than February 19th, 1938.

H. C. DAVIES,
County Offices, Clerk of the Council,
Thorpe Road, Norwich.
January 22nd, 1938.

BOROUGH OF CHATHAM

ASSISTANT MEDICAL OFFICER OF HEALTH AND ASSISTANT SCHOOL MEDICAL OFFICER.

Applications for the above post are invited from registered medical practitioners (male or female), under the age of 45 and holding the D.P.H. or its equivalent.

The commencing salary will be £500 p.a. rising, on satisfactory service, by annual increments of £25 to £700 per annum.

The post is subject to the provisions of the Local Government and Other Officers' Superannuation Act, 1922, and the successful candidate passing a medical examination.

The person appointed will be required to devote his or her whole time to the duties of the office to act under the direction and supervision of the Medical Officer of Health, who is also School Medical Officer, and must have had at least three years' experience, subsequent to graduation, in experience in School Medical Inspection, Refraction, Dental Anaesthetics, Ante-natal and Child Welfare Clinics and Diphtheria Immunisation is very desirable, and full details of such experience should be given in the application.

The duties of the office will be chiefly Medical Officer for the various Clinics, and will include appointment, subject to consent of Minister of Health, as Deputy Medical Officer of Health.

Applications, stating age, qualifications and experience, together with copies of not more than three recent testimonials, must reach me by 10 a.m. on Tuesday, February 22nd, 1938.

Canvassing, directly or indirectly, will be a disqualification.
Town Hall, EDWARD B. TIE,
Chatham. Town Clerk.
February 12th, 1938.

ADMINISTRATIVE COUNTY OF NORFOLK ASSISTANT COUNTY MEDICAL OFFICER AND MEDICAL OFFICER OF HEALTH for Wells Urban District, Docking Rural District, Walsingham Rural District.

The Norfolk County Council and the District Councils concerned invite applications from medical practitioners holding a diploma in public health, or similar qualification, for the joint whole-time appointment of ASSISTANT COUNTY MEDICAL OFFICER and MEDICAL OFFICER OF HEALTH for the Urban District of Wells-next-the-Sea, and the Rural Districts of Docking, and Walsingham. Population of area about 37,000; a further urban district (population 3,000) may be added later.

The salary for the combined appointment will be £800 per annum, with travelling expenses in accordance with the County Council scale. The post will be designated under the Local Government and Other Officers' Superannuation Act, 1922, and the salary will be subject to the statutory deduction for this purpose. The successful applicant will be required to pass a medical examination.

The officer will act under the County Medical Officer as Assistant School Medical Officer, Medical Officer to Infant Welfare Centres, and will be required to perform such other duties as may be assigned to him by the County Council. As regards his duties as Medical Officer of Health he will be subject to the control of the District Councils concerned and be required to live at or near an approved centre in his area.

The appointment will be subject to three months' notice to be given, or received, by the Clerk of the County Council.

Applications must be made on the prescribed form, which can be obtained from the County Medical Officer, Norfolk, to whom they should be returned, accompanied by copies of not more than three recent testimonials, not later than February 19th, 1938.

Canvassing in any form will be a disqualification. H. C. DAVIES,
Clerk of the County Council.
W. A. WILLIAMSON,
Clerk to the Wells Urban District Council.
J. H. MARSHALL,
Clerk to the Docking Rural District Council.
A. E. KERRISON,
Clerk to the Walsingham Rural District Council.
January 31st, 1938.

DERBYSHIRE COUNTY COUNCIL. ASSISTANT COUNTY MEDICAL OFFICER OF HEALTH.

Applications are invited for the post of Assistant County Medical Officer of Health. Candidates must possess a qualification in Public Health, have had both practical and administrative experience of the medical inspection of school children, the organization of school clinics and infant welfare centres, and have a sound knowledge of the provisions of the Midwives Acts and the rules of the Central Midwives Board.

The Officer appointed will be required to devote the whole of his time to the duties of the office and to work under the direction of the County Medical Officer.

The salary will be £700 rising by annual increments of £25 to £800 a year, and the appointment will be subject to the approval of the Minister of Health and the Board of Education.

The appointment will be a designated post under the Local Government and Other Officers' Superannuation Act, and the successful candidate will be required to pass a medical examination.

The appointment will be determinable by three months' notice on either side.

Applications, stating age, qualifications and previous experience, together with copies of not more than three recent testimonials, must be received by the undersigned not later than March 3rd, 1938. Application forms are not provided.

W. M. ASH,
County Offices, County Medical Officer of Health.
Derby.
February 3rd, 1938.

COUNTY BOROUGH OF HUDDERSFIELD. ASSISTANT SCHOOL MEDICAL OFFICER.

Applications are invited for the above post, for which a good knowledge of diseases of children and experience in bacteriology are essential.

Salary according to scale—£500 per annum increasing to £700. The commencing salary will be based on the candidate's previous Superannuation Act, 1922, and the appointment, therefore, is subject to a satisfactory medical examination.

Applications, stating age and giving full particulars regarding training, qualifications, and appointments held since qualification, should be forwarded to the Medical Officer of Health, along with copies of two recent testimonials, so as to reach him not later than Friday, February 25th.

CORNELIA AND EAST DORSIT HOSPITAL. Poole, Dorset (120 Beds)

HOUSE PHYSICIAN

Applications are invited from single men for the post of House Physician.

Period ending September 30th, 1938. Salary at the rate of £150 p.a., with usual emoluments.

Reappointment may be applied for, and if granted the salary is at the rate of £175 per annum. Duties to commence as soon as possible.

The Hospital is recognized by the Royal College of Surgeons of England in connection with the Final Examination for the Fellowship.

Applications, stating age, nationality, experience and qualifications, together with copies of three recent testimonials (which will not be returned) should reach the undersigned at the Hospital immediately.

Preference will be given to applicants who have already held a resident appointment in a Hospital.

E. S. FOLEY.

Secretary.

CUMBERLAND INFIRMARY, CARLISLE (131 Beds)

Applications are invited from men only for the following posts:

HOUSE PHYSICIAN

TWO HOUSE SURGEONS

HOUSE SURGEON to Special Departments (Eye, Ear, Nose and Throat).

Appointments are for six months from April 1st, 1938, and holders will be eligible for a further term. Salary in each case at the rate of £170 per annum, with board, residence and laundry.

The posts of House Surgeon are recognized by the Royal College of Surgeons of England under the regulations for the Final Fellowship Examination.

Applications, on forms obtainable from the undersigned, together with copies of not more than four testimonials, to be received not later than February 25th.

J. S. RIPPET.

February 7th, 1938. Secretary-Superintendent.

ARGYLL AND BUTE DISTRICT MENTAL HOSPITAL, Lochalsh.

Applications are invited for the post of RESIDENT ASSISTANT MEDICAL OFFICER (male). Commencing salary £300 to £350 per annum, according to previous experience and special qualifications. An additional £50 per annum will be paid if in possession of the D.P.M. (Furnished apartments will be provided, with board and laundry. The appointment will be subject to the provisions of the Asylum Officers' Superannuation Act, 1909.)

Applications, stating age and experience, accompanied by seven copies of testimonials, to be addressed to the Clerk to the Joint Board of Management, County Offices, Lochalsh, not later than February 16th, 1938.

ADDENBROOKE'S HOSPITAL, CAMBRIDGE.

Applications are invited for the post of House Surgeon. The appointment will be for six months from March 15th, 1938, but is terminable at an earlier date by one month's written notice on either side. Salary will be at the rate of £130 per annum, with board, residence and laundry. Candidates (male) who must be unmarried and duly registered, are requested to forward their applications, stating age, qualifications, etc., together with copies of not more than four testimonials, to the undersigned on or before Wednesday, February 23rd, 1938.

J. A. BEARDSALL.

Secretary-Superintendent.

KENT AND SUSSEX HOSPITAL. Royal Tunbridge Wells. (210 Beds.)

Applications are invited for the appointment of HOUSE PHYSICIAN (male). Salary £150 per annum. Board, residence, and laundry in the hospital.

The hospital is approved by the University of London for the purpose of the M.B. examination. Successful candidate will be required to take up duty on March 1st, 1938, and applications, stating qualifications, together with Certificate of Registration and copies of not more than three recent testimonials, should be sent to the undersigned immediately.

TOM B. HARRISON.

Superintendent-Secretary.

February 3rd, 1938.

DEWSBURY AND DISTRICT GENERAL INFIRMARY, DEWSBURY.

Applications are invited for the post of SECOND HOUSE SURGEON (Male). The duties are principally those of a House Physician and Casualty Officer. Salary £150 per annum, with board, residence and laundry.

Applications, stating age and hospital experience, together with copies of recent testimonials, to be sent as immediately as possible.

FRED SMITH.

Secretary-Superintendent.

EAST SUSSEX COUNTY MENTAL HOSPITAL, HILLINGDY.

JUNIOR ASSISTANT RESIDENT MEDICAL OFFICER.

Applications are invited for the above post from duly qualified registered medical practitioners (unmarried).

Salary £350 a year, rising by four annual increments of £25 to £450, together with board, lodging, washing and attendance, valued for superannuation purposes at £10 a year, an additional £50 a year will be paid to any candidate appointed who holds the Diploma in Psychological Medicine, or a similar Diploma.

The appointment is subject to one month's notice on either side, and to the provisions of the Asylum Officers' Superannuation Act, 1909.

Applications, marked "A.M.O.", giving particulars of previous experience and copies of not more than three recent testimonials, should be addressed to the Medical Superintendent not later than February 17th, 1938.

KING EDWARD VII HOSPITAL, WINDSOR (200 Beds)

HOUSE SURGEON required, beginning March (preferably with Ear, Nose and Throat experience), also a HOUSE PHYSICIAN. Applicants must be fully qualified men or women, and registered.

Salary at the rate of £120 per annum, together with board, residence and laundry.

Applications, stating age, qualifications and experience, accompanied by testimonials, should be sent to the undersigned not later than February 15th.

The Surgical appointment is recognized by the Royal College of Surgeons of England for the six months' training required of candidates before admission to the final examination for the Fellowship.

A. L. CHURCHER

Secretary.

KENT AND CANTERBURY HOSPITAL, Canterbury

The Board of Management will shortly proceed to the election of an HONORARY DERMATOLOGIST.

Candidates must be engaged solely in the practice of Dermatology.

Applications, with copies of three testimonials, should be addressed to the undersigned, from whom particulars of the appointment can be obtained. The closing date for the receipt of applications is March 7th, 1938.

I. F. KENT

Superintendent and Secretary.

KELLING SANATORIUM, HOLT, NORFOLK

SECOND ASSISTANT RESIDENT MEDICAL OFFICER (Male), unmarried, required at above Sanatorium to take up duty on April 1st next. First appointment twelve months (renewable), with three months' notice on either side. Salary £350, with apartments, board and laundry.

Candidates must be duly registered Medical Practitioners.

Applications, in candidate's own handwriting, stating age and qualifications (with one copy of three recent testimonials) to be sent to the Medical Superintendent, Kelling Sanatorium, Holt, Norfolk, not later than March 5th.

GLASGOW CORPORATION MENTAL HOSPITALS.

JUNIOR ASSISTANT MEDICAL OFFICER (male) wanted for the Hawkhead Mental Hospital, previous experience unnecessary, but preference will be given to one who has engaged in pathological work or has been house physician, and opportunity afforded for research. Salary to commence at £300 per annum, with board, lodging, and laundry. Full particulars on application to the Medical Superintendent, Hawkhead Mental Hospital, Crookston Road, Glasgow, S.W.2.

ROYAL EYE HOSPITAL, Percy Road, Eastbourne.

NON-RESIDENT HOUSE SURGEON required to commence duty forthwith. Salary £100 per annum, and allowance in lieu of board-residence £100 per annum.

Applications, stating age, qualifications and Ophthalmic experience, together with recent testimonials, should reach the undersigned as soon as possible.

Before engagement, candidates have to be interviewed by appointment by the Hon. Surgeon, from whom further particulars could be obtained in person.

H. BYGRAVE.

Secretary.

SOUTHAMPTON CHILDREN'S HOSPITAL AND DISPENSARY FOR WOMEN.

The Board of Management invite applications for the post of RESIDENT MEDICAL OFFICER (lady). Six months' appointment. Salary at the rate of £150 per annum, with board, residence and laundry.

Applications, stating age, accompanied by copies of testimonials, to be sent to the undersigned not later than February 15th. The selected candidate will be required to take up her duties at the beginning of March.

ELLA K. MATTHEWS.

Secretary.

SOUTHPORT GENERAL INFIRMARY. (150 Beds.)

Special Departments for Eye, Ear, Nose and Throat, X Rays, Massage, Skin, Pathology, etc.

Wanted, to take up duties on March 1st next, a JUNIOR HOUSE SURGEON. Salary £150 per annum, with residence, board, and laundry.

Applicants to be fully qualified, registered, and unmarried. Applications, stating age and experience, with copies of testimonials, to be sent in by February 21st to the Superintendent and Secretary, Infirmary Office, Pilkington Road, Southport.

COUNTY COUNCIL OF MIDDLESEX. PHYSICIAN—GRADE I. REDHILL COUNTY HOSPITAL, EDGWARE.

Applications are invited from registered medical practitioners for the above appointment on the pensionable staff. The appointment is a senior one in the Council's general hospital service, and applicants are expected to be medical men or women of high qualifications and professional attainments, who are devoting their time wholly or chiefly to the practice of clinical medicine. The officer appointed will work under the direction of the Medical Superintendent of the Hospital and will give his whole time to the duties of the post. He must be prepared to undertake the teaching of nurses and, if required, of students and to carry out such other duties as the Council may from time to time direct.

The Hospital is one of 225 beds for acute medical and surgical cases and for maternity. Large extension of over 300 further beds are nearing completion. In addition to a full-time physician, surgeon, obstetrician and pathologist, there is a resident medical staff of five and a part-time radiologist pathologist, and dental surgeon.

Salary £1,000 per annum, rising by annual increments of £50 to £1,500 per annum. The salary is inclusive and any fees received by the officer appointed must be paid over to the Council.

The appointment is non-resident, but the successful candidate will be required to reside within a short distance of the Hospital. The appointment, which will be subject to medical examination, will be held during the pleasure of the Council, and is terminable by three months' notice on either side.

Applications, stating age, qualifications, and experience, together with copies of not more than three recent testimonials, must be received by the undersigned not later than February 26th. Relationship to any member or officer of the Council must be disclosed in the application. Application forms must be enclosed in the application. Envelopes must be addressed to "Physician, Redhill County Hospital."

Canvassing, directly or indirectly, will be a disqualification.

C. W. RADCLIFFE, "Z,"
Clerk of the County Council.
Middlesex Guildhall,
Westminster, S.W.1
February 3rd, 1938.

SURREY COUNTY COUNCIL. PUBLIC HEALTH DEPARTMENT. KINGSTON COUNTY HOSPITAL. (530 Beds.) RESIDENT ASSISTANT MEDICAL OFFICER.

Applications are invited from registered Medical Practitioners for the appointment of Resident Assistant Medical Officer at the Kingston County Hospital, Kingston-on-Thames.

The Medical Officer appointed should preferably have had previous experience as House Physician or House Surgeon. The appointment is for a period of six months, and renewable for a further period of six months, and the salary is at the rate of £250 per annum, together with full residential emoluments valued at £125 per annum, making an aggregate of £375 per annum.

Applications, stating age, qualifications and experience, and enclosing copies of not more than three recent testimonials, should be addressed to the Medical Superintendent, Kingston County Hospital, Wolverton Avenue, Kingston-on-Thames, so as to be received not later than February 23rd, 1938.

DUDLEY AUKLAND,
County Hall, Kingston-on-Thames.
February 4th, 1938.
Clerk of the Council.

CITY OF LEICESTER. RESIDENT MEDICAL OFFICERS.

The Health Committee of the City of Leicester invite applications for the position of two Resident Medical Officers (male) at their CITY GENERAL HOSPITAL for a period of six months.

Successful candidates will be required to commence March 9th and April 1st respectively. Reference will be given to those with, or reading, high qualifications.

The Hospital is a modern building, with 550 beds, four Resident Medical Officers and one Deputy Medical Superintendent. The work that will be required of these Resident Medical Officers will be chiefly Medical; there may, however, be some general Surgical work.

Salary £300 per annum, together with full residential emoluments. Further particulars of the appointment may be obtained from the undersigned, and applications (on forms supplied), accompanied by copies of three recent testimonials, must be received not later than February 21st, endorsed "R.M.O.," addressed to the undersigned.

E. K. MACDONALD,
Medical Officer of Health
Health Department, Grey Friars, Leicester.

COUNTY COUNCIL OF MIDDLESEX. OBSTETRIC SURGEON.

Applications are invited from registered Medical Practitioners for the appointment on the pensionable staff of an Obstetric Surgeon, Grade II., at West Middlesex County Hospital, Isleworth. The appointment is a senior one in the Council's general hospital service, and applicants are expected to be medical men or women of high qualifications and professional attainments, who have devoted their time wholly or chiefly to the practice of obstetrics and gynaecology. The successful candidate will work under the direction of the Medical Superintendent of the Hospital, and the whole of his time must be given to his official duties. He must be prepared to undertake the teaching of midwives and students, if required, and to carry out such other duties as the County Council may from time to time direct.

Salary £650 per annum, rising by annual increments of £50 to £900; and after eight years' service in this grade, two additional annual increments of £50 each. The salary is inclusive, and any fees received by the officer appointed must be paid over to the County Council.

The appointment is non-resident, and the successful candidate will be required to reside within a short distance of the Hospital. In the case of an unmarried officer, if accommodation is available, board, lodging, laundry and service may be provided by the County Council, and in this event a deduction of £150 per annum will be made from the officer's salary.

The appointment, which will be subject to medical examination, will be held during the pleasure of the Council, and is terminable by three months' notice on either side.

Applications, stating age, qualifications and experience, together with copies of not more than three recent testimonials, must be received by the undersigned not later than February 26th. Relationship to any member or officer of the Council must be disclosed in the application. Envelopes must be addressed to "Obstetric Surgeon, West Middlesex County Hospital."

Canvassing, directly or indirectly, will be a disqualification.

C. W. RADCLIFFE, "Z,"
Clerk of the County Council.
Middlesex Guildhall,
Westminster, S.W.1
February 3rd, 1938.

BOROUGH OF KEIGHLEY. APPOINTMENT OF LADY DEPUTY MEDICAL OFFICER OF HEALTH AND ASSISTANT SCHOOL MEDICAL OFFICER.

Applications are invited for the above whole-time appointment from registered lady medical practitioners of at least three years' standing and holding the D.P.H. or equivalent qualification. Salary £500 per annum, rising by annual increments of £25 to a maximum of £700; the emoluments of £25 to be fixed according to previous service.

Applications, on the form which may be obtained from the undersigned, giving full particulars and conditions of appointment, must be received by the undersigned not later than February 19th, 1938.

Canvassing, either directly or indirectly, will be a disqualification.

S. WALKER,
Town Clerk's Office, Keighley.

LONDON COUNTY COUNCIL.

Applications invited from Medical Practitioners of at least one year's standing to undermentioned position. Experience in a resident appointment in a general hospital for at least six months desirable. Married quarters not available.

MARY'S HOSPITAL FOR CHILDREN, QUEEN CARSHALTON, SURREY. (1,284 beds.)

There are special departments for rheumatic and orthopaedic conditions, for congenital malformations and for nutritional diseases.

ASSISTANT MEDICAL OFFICER (Grade II.). Salary £250 a year. Appointment for one year lodging and washing. Appointment for a second year only in first instance (renewable for a second year under certain conditions).

Application forms, obtainable (stamped addressed under certain conditions) from Medical Officer of Health, Staff division 2A, County Hall, S.E.1, returnable by February 21st.

Canvassing disqualifies.

GENERAL INFIRMARY, SALISBURY. (Voluntary Hospital—194 beds, now in course of extension to 215 beds.)

HOUSE SURGEON (MALE) required to commence duty March 17th, 1938.

The appointment is for six months, with the right of applying for reappointment for a further period of six months. Candidates must be unmarried, fully qualified, and registered.

Salary £125 per annum, with board residence. Applications, with copies of testimonials, to be sent to the House Governor and Secretary, from whom a copy of the rules may be obtained.

BOROUGH OF CHATHAM EDUCATION COMMITTEE. DENTAL SURGEON.

Applications are invited for the post of Dental Surgeon from ladies and gentlemen under the age of 45, holding a registered Diploma or Degree in Dental Surgery. The successful applicant will be required to carry out duties in connexion with the dental inspection and treatment of school children, Maternity and Child Welfare mothers and children, and will also be required to perform other dental work as may be required by the Education Committee.

The successful candidate will be required to devote his or her whole time to the duties of the office under the direction of the Medical Officer of Health, and will not be permitted to engage in private practice.

Salary £500 per annum, rising subject to satisfactory service by annual increments of £20 to £600 per annum. The post will be designated for the purposes of the Local Government and Other Officers' Superannuation Act, 1922, and the successful candidate must pass a medical examination.

Applications, stating age, qualifications and experience, together with copies of three recent testimonials, should reach the undersigned not later than 10 a.m. on February 22nd, 1938.

R. L. WILLS,
15, New Road Avenue,
Chatham.
February 7th, 1938.
Education Officer.

CITY OF PLYMOUTH. CITY GENERAL HOSPITAL (570 Beds.)

Applications are invited from duly qualified and registered medical practitioners for the following posts:

(1) ASSISTANT MEDICAL OFFICER.
Salary at the rate of £300 per annum, with full residential emoluments. All fees received by the Officer must be refunded to the Council.

The appointment will be for a period of twelve months, terminable by one month's notice on either side. Previous experience in a general hospital is essential. As the duties of the post also include general work, preference will be given to candidates who have had such experience.

(2) JUNIOR ASSISTANT MEDICAL OFFICER.
Salary at the rate of £250 per annum, with full residential emoluments. All fees received by the Officer must be refunded to the Council.

The appointment will be for a period of six months in the first instance, and will be terminable by one month's notice on either side.

Forms of application may be obtained from the undersigned, and should be forwarded, together with copies of not more than three recent testimonials, not later than February 25th.

T. PEIRSON,
Town Hall, Plymouth.
Medical Officer of Health.
Stonchouse, February 5th, 1938.

ESSEX COUNTY COUNCIL. JUNIOR ASSISTANT MEDICAL OFFICER.

The County Council of the Administrative County of Essex invite applications for the appointment of Junior Assistant Medical Officer at the Black Notley Sanatorium, near Braintree.

This Sanatorium has 300 beds for the treatment of pulmonary and non-pulmonary tuberculosis in men, women and children, and has all modern facilities for diagnosis and treatment, together with a staff of visiting Specialists.

The appointment is for a period of one year, and the salary will be at the rate of £250 per annum, together with board, lodging and laundry.

The successful applicant will be required to pass a medical examination, and will be subject to the Council's Sick Pay Rules and Regulations, a copy of which will be forwarded on application.

Applications, stating age, qualifications and experience, accompanied by copies of not more than three recent testimonials (which will not be returned), should be addressed to me and delivered at the County Hall, Chelmsford, not later than 10 a.m. on Thursday, February 24th, 1938.

E. S. HOLCROFT,
County Hall, Chelmsford.
Clerk of the County Council.
February 7th, 1938.

WEST KENT GENERAL HOSPITAL (Incorporated). Maidstone. (136 Beds.)

Applications are invited for the post of HOUSE SURGEON, who must be a male of British nationality, and unmarried.

Salary at the rate of £175 per annum, with board, apartments and laundry. Candidates must possess registered qualifications.

Applications, stating qualifications and experience, together with copies of testimonials, should be sent to the undersigned on or before March 1st, 1938.

The successful candidate will be required to take up residence on March 10th, 1938.

EDWARD J. GREGG,
House Governor and Secretary.

By Order of the Council.

G. C. ANDERSON, Secretary.

THE GLOUCESTERSHIRE—ROYAL INFIRMARY AND EYE INSTITUTION, Gloucester. (225 Beds. Five Residents.)

Applications are invited for the post of HOUSE SURGEON (male) to the Ear, Nose and Throat Department. Salary at the rate of £150 per annum, with board, residence and laundry. The Hospital is recognized for the D.L.O. and the F.R.C.S. Final Examinations. The appointment is for six months, which may be extended for similar period by re-election from time to time.

Applications, stating age, qualifications, experience and nationality, with copies of not less than three recent testimonials, should be received by the undersigned not later than Wednesday, February 16th. The elected candidate will be required to enter upon his duties on March 1st.

F. J. SYMONS,
Secretary.

February 3rd, 1938.

THE GENERAL INFIRMARY AT LEEDS. RADIO-SURGICAL HOUSE SURGEON (male or female).

Applications are invited for the above post. Salary £50 per annum, with board, residence and laundry. The appointment is for six months, subject to renewal. Candidates must be legally qualified and registered.

Applications, with copies of testimonials, to be sent in at once to the undersigned.

S. CLAYTON FRYERS,
House Governor and Secretary.

HARTLEPOOLS HOSPITAL, HARTLEPOOL. (96 Beds.)

Applications are invited for the post of HOUSE SURGEON (male). Salary £150 p.a. with board, residence and laundry.

The appointment is for six months (commencing February 25th).

Applications, stating nationality, age, qualifications and experience, should be addressed to the undersigned.

NORMAN O. DEANS,
Secretary.

HULL ROYAL INFIRMARY.

Applications are invited for the post of SECOND CASUALTY OFFICER (male) vacant February 15th.

Salary £150 per annum, plus board, residence and laundry.

In addition to carrying out duties in the Casualty Department the officer appointed will act as House Surgeon to one of the Honorary Assistant Surgeons, and will thus obtain Ward and Theatre experience. He will be eligible for promotion to a more senior post when a vacancy occurs.

The appointment will be for a period of six months, but will be determinable at any time by one month's notice on either side.

Applications, giving particulars of age, experience and nationality, together with copies of testimonials, should be addressed to the undersigned.

R. J. CARLESS,
House Governor.

January 31st, 1938

KETERING AND DISTRICT GENERAL HOSPITAL. (105 Beds.)

Applications are invited for the post of HOUSE PHYSICIAN.

Salary £150 per annum, with board, residence and laundry. Candidates must be fully qualified and registered.

The appointment is for six months, with eligibility for a further period.

Applications, stating age, nationality, and qualifications, together with copies of three testimonials, to be sent to the undersigned as soon as possible.

G. W. JACKSON,
Secretary-Superintendent.

ROYAL LANCASTER INFIRMARY. (140 Beds.)

JUNIOR HOUSE SURGEON (male, British, single) required for March 1st 1938. Salary £120 per annum with board, residence and laundry. The appointment is for six months.

Applications with copies of testimonials, should be addressed to the Hon. Secretary, Royal Lancaster Infirmary.

WILSON HOSPITAL, MITCHAM, SURREY. (72 Beds.)

RESIDENT MEDICAL OFFICER, male or female, required from March 31st next. Salary £150 per annum, with board, residence and laundry.

The appointment is for six months, renewable for a further six months at the discretion of the Committee. The Hospital is quite modern and exceptionally well equipped, and carries out work of a character which gives the Resident Medical Officer a considerable amount of experience.

Applications, with copies of three testimonials, stating age, qualifications and experience (particularly anaesthetics), should be sent to the Hon. Secretary, "Greenview," Lower Green, Mitcham, on or before Saturday, February 26th, 1938.

CHILDREN'S HOSPITAL, NOTTINGHAM.

Applications are invited for the post of RESIDENT HOUSE PHYSICIAN (woman). The salary will be at the rate of £150 per annum, with apartments, board and laundry. The appointment will be for six months, duties to commence on April 1st.

Applications, together with testimonials, stating age, qualifications and experience, to be sent to the Honorary Secretary, 1, King John's Chambers, Bridlemere Gate, Nottingham, on or before Tuesday, February 15th. Selected candidates will be required to attend at the Hospital for a personal interview.

CHILDREN'S HOSPITAL, NOTTINGHAM.

Applications are invited for the post of RESIDENT HOUSE SURGEON (woman). The salary will be at the rate of £150 per annum, with apartments, board and laundry. The appointment will be for six months, duties to commence on May 1st.

Applications, together with testimonials, stating age, qualifications and experience, to be sent to the Honorary Secretary, 1, King John's Chambers, Bridlemere Gate, Nottingham, on or before Tuesday, February 15th. Selected candidates will be required to attend at the Hospital for a personal interview.

(Appointments continued on p. 60.)

THE PRINCE OF WALES'S HOSPITAL, Greenbank Road, Plymouth. (Formerly South Devon and East Cornwall Hospital.) 264 Beds.

Applications are invited for the post of **RESIDENT ANAESTHETIST AND HOUSE SURGEON** to the Special Departments. Salary £120 per annum, with board, residence and laundry.

Appointment is tenable for six months and is subject to renewal. Duties to commence March 10th. The Hospital is officially recognised for the surgical practice required before admission to the Final Fellowship Examination of the Royal College of Surgeons of England.

Applicants must be registered under the Medical Acts. Applications, stating age and qualifications, with copies of three recent testimonials, to reach the undersigned not later than February 25th.

ARTHUR R. CASH,

February 7th, 1938. Secretary.

THE CHRISTIE HOSPITAL AND HOLT RADIUM INSTITUTE, Withington, Manchester 20

Applications are invited for the post of **RESIDENT MEDICAL OFFICER** to the above Hospital and Institute for duty with the Radio-therapy Department to commence April 1st. Appointment is for six months in the first instance, but is renewable. Salary at the rate of £150 per annum, plus residence (private suite), board, etc.

The appointment offers an excellent opportunity of obtaining experience in Radium and X-ray Therapy. Candidates must have had previous Medical and Surgical experience.

Applications, stating age, qualifications and previous experience, to be received by the undersigned not later than March 1st.

PERCY N. GLASS,

Superintendent

THE RADCLIFFE INFIRMARY, OXFORD.

Applications are invited from qualified men or women for the post of **RESIDENT MEDICAL OFFICER** to that section of the Hospital, consisting of 52 beds and dealing with the diagnosis and treatment of pulmonary tuberculosis, known as the Oster Pavilion, Headington, Oxford, as from March 15th, 1938.

Appointment will be for six months in the first instance. Salary at the rate of £120 per annum, with board, etc.

Applications, with copies of testimonials, must be forwarded to the undersigned at the Radcliffe Infirmary not later than February 21st, 1938.

A. G. E. SANCTUARY,

February 7th, 1938. Administrator.

WARNEFORD GENERAL HOSPITAL, Leamington Spa. (164 Beds.)

Applications are invited for the post of **RESIDENT CASUALTY OFFICER AND HOUSE SURGEON** to one of the Hon. Surgeons. Six months appointment. Salary £150 per annum, with board and laundry.

Applications from qualified registered Medical Practitioners should be sent, together with three recent testimonials, to the undersigned by February 21st, 1938.

EDWARD L. WIRGMAN,
House Governor and Secretary.

THE GENERAL INFIRMARY AT LEEDS. (673 Beds.)

Applications are invited for the post of **RESIDENT ORTHOPAEDIC OFFICER**. Salary £149 p.a., with board, residence and laundry. The appointment is for twelve months, subject to renewal. Candidates must be legally qualified and registered, and have held a Resident Surgical post and had special experience in Orthopaedic work.

Applications, with copies of testimonials, to be received by the undersigned as soon as possible.

S. CLAYTON FRYERS,

House Governor and Secretary.

THE ST. HELENS HOSPITAL.

Applications are invited for the position of **JUNIOR HOUSE SURGEON (Male)** to this Hospital at a salary of £150 per annum, plus board, residence and laundry.

Applications, stating age and nationality, accompanied by copies of three recent testimonials, to be sent to the Secretary, the St. Helens Hospital, St. Helens, Lancashire, not later than Tuesday, February 22nd.

The successful applicant will be required to commence duties on March 1st next.

THE STAFFORDSHIRE GENERAL INFIRMARY, STAFFORD. (143 Beds.)

SECOND HOUSE SURGEON required immediately. Salary £175 per annum, with board residence.

Applications, stating age and experience, accompanied with copies of three recent testimonials, should be sent to me on or before first post on Thursday, the 17th instant.

TENDER

COUNTY COUNCIL OF MIDDLESEX.
PUBLIC ASSISTANCE DEPARTMENT.

TENDERS for:—

Dressings, Surgical Appliances, Surgical Instruments, etc.; Basic Drugs, B.P. or B.P.C. Preparations; Proprietary Drugs, Sera, Nitrous Oxide Gas, Oxygen, etc.; Pathological Requisites; X-ray, Light and Radium Requisites. (Six months.)

The County Council of Middlesex invites tenders for the supply of the above goods or materials for the period stated from April 1st, 1938, to its several Hospitals, Institutions, Sanatoria, Children's Homes, Offices, etc.

Forms of tender (upon which only tenders will be considered), and conditions of contract, may be obtained on application to the Director of Public Assistance, 3, Central Buildings (Fourth Floor), Matthew Parker Street, Westminster, S.W.1, accompanied by a stamped addressed foolscap envelope.

Sealed tenders, marked "Tender for—" must be delivered at or before 11 a.m. on Monday, February 28th, 1938, addressed to "The Clerk of the Middlesex County Council, 2, Guildhall, Westminster, S.W.1."

The Council does not bind itself to accept the lowest or any tender, and reserves the right to accept any tender or part only.

Estimated quantities required are stated in the form of tender, and tenderers may tender to supply all or any one or more of the Establishments concerned.

Guildhall, C. W. RADCLIFFE, "2,"
Westminster, Clerk of the County Council.
February, 1938.

FINANCIAL ASSISTANCE ARRANGED.

ASSISTANTS.—VACANCIES IN TOWN and Country. Indoor and Outdoor. List on application.

WEST LONDON HOSPITAL. Hammersmith, W.6. (239 Beds.)

Applications are invited for the post of MEDICAL REGISTRAR to the Children's Department for a period of one year, eligible for re-election annually for a total period of not more than three years. An honorarium at the rate of £100 a year is attached to the post.

The duties include attendance in the Out-Patient Department on four mornings a week, acting as deputy for the Physician to the Children's Department when required, and such teaching for the West London Hospital Medical School as the Board may approve.

Candidates, who may be male or female, must be registered under the Medical Act, and should have had wide experience in children's work.

Applications, with copies only of testimonials, should reach me not later than Thursday, February 17th. Candidates must attend the meeting of the Medical Council at 4.30 p.m. on Friday, February 18th, and prior to that date call upon and send copies of their application and testimonials to each member thereof. They must not canvass members of the Board, but nevertheless should send copies of their application and testimonials to each member thereof and, if so notified, be in attendance at a meeting of the Board at 5 p.m. on Tuesday, February 22nd, when the election will be made.

H. A. MADGE, Secretary.

WEST LONDON HOSPITAL, Hammersmith Road, W.6. (239 Beds.)

Required March 1st, one RESIDENT ANAESTHETIST (male). The appointment is tenable until September 30th, 1938, subject to one month's notice on either side. Salary at the rate of £100 a year, with board, lodgings and laundry allowance. Candidates must be registered under the Medical Act.

Applications (which must be made on printed forms obtained from me) must reach me not later than first post on Friday, February 18th. Selected candidates will be required to call upon such members of the Medical Staff as directed; to be in attendance at the Medical Council meeting on Friday, February 25th, at 4.30 p.m. and the House Committee meeting at 5 p.m. the same day, when the appointment will be made.

H. A. MADGE, Secretary.

ROYAL LONDON OPHTHALMIC HOSPITAL (MOORFIELDS EYE HOSPITAL), City Road, E.C.1.

Applications are invited for the post of SENIOR RESIDENT OFFICER.

Candidates must be registered Medical Practitioners and must be prepared to begin duties on May 1st, 1938.

Salary at the rate of £150 per annum, with board and residence in the Hospital. Additional income will accrue to this post, the care of private patients being included in the duties.

In the event of the First House Surgeon being appointed, other candidates are requested to state whether they would accept the office of First House Surgeon at the rate of £150 p.a., Second House Surgeon at the rate of £125 p.a., or Third House Surgeon at the rate of £100 p.a. The candidate elected as Third House Surgeon must be prepared to begin his duties with the present officer on April 1st, 1938, and will be non-resident until May 1st, 1938.

The appointments are for a period of six months as from May 1st, 1938.

Applications, with testimonials, stating age and qualifications, must be received not later than February 25th, 1938, by

A. J. M. TARRANT,
Secretary.

ST BARTHOLOMEW'S HOSPITAL. WHOLE-TIME CHIEF ASSISTANT IN THE X-RAY DIAGNOSTIC DEPARTMENT.

Applications are invited for the post of Whole-time Chief Assistant in the X-ray Diagnostic Department of the above Hospital.

The salary will be at the rate of from £400 to £500 per annum, and appointment will be made as from March 1st, 1938.

Candidates, who must possess a Diploma in Medical Radiology, should send in their applications to the undersigned not later than Saturday, February 19th, 1938.

C. C. CARUS-WILSON,
January 22nd, 1938. Acting Clerk to the Governors.

ROYAL FREE HOSPITAL, GRAY'S INN ROAD, W.C.1.

Applications are invited from duly qualified and registered medical women for the following post: RESIDENT CASUALTY OFFICER.

Duties to commence April 1st, 1938, for six months. Salary £150 per annum. Candidates must have held previous resident hospital appointments. Application form may be had from the undersigned and should be duly filled in and returned on or before March 5th, 1938.

RICHARD T. BARTLEY,
Secretary.

METROPOLITAN BOROUGH OF FULHAM. MATERNITY HOME AND CLINIC.

RESIDENT MEDICAL OFFICER AND ASSISTANT MEDICAL OFFICER FOR MATERNITY AND CHILD WELFARE.

Applications are invited from unmarried qualified medical practitioners of either sex, with special obstetric experience, for the appointment of Resident Medical Officer and Assistant Medical Officer for Maternity and Child Welfare at the Council's new Maternity Home and Clinic (25 Beds). The officer appointed will also have medical charge of certain ante-natal, post-natal, infant welfare and ultra violet light clinics, and experience in these and the possession of the Diploma in Public Health will be additional qualifications.

The scale of salary will be £350 per annum, rising by annual increments of £25 to £550 per annum, plus emoluments valued for superannuation purposes at £150 per annum. The commencing salary will be within the above scale at a point in accordance with the qualifications and experience of the person appointed as determined by the Council.

Detailed particulars of the terms and conditions of the appointment, together with a form of application, will be sent on receipt of a stamped, addressed, foolscap envelope.

Applications must be delivered to me not later than February 19th. Canvassing is strictly prohibited and will disqualify.

WILFRED TOWNEND,
Town Hall, Fulham, S.W.6. Town Clerk.

THE HOSPITAL FOR SICK CHILDREN. Great Ormond Street, London, W.C.1.

A RESIDENT AURAL REGISTRAR is required duties to commence not later than April 1st, 1938.

Gentlemen are invited to send in their applications, addressed to the Secretary, before 12 o'clock on Monday, February 21st, 1938, with copies of not more than three testimonials given specially for the purpose.

The appointment will be made for one year, but the holder may be re-elected for a further period of one year. Salary £150 per annum, laundry allowance £10, board and residence in the hospital. The duties will be those of a house officer to the Aural In-Patients, and of a registrar in assisting in the Aural Out-Patient Department. Opportunity will be afforded for acquiring operative experience.

Candidates must be unmarried and possess a legal qualification to practise, and must have held a responsible resident appointment at a General Hospital.

All candidates must be in attendance to appear before the Joint Committee, if required, at their meeting on Wednesday, March 2nd, 1938, at 4.45 p.m. precisely.

Forms of application and copies of the Rules can be obtained from the undersigned.

HERBERT F. RUTHERFORD,
January, 1938. Secretary.

GOLDEN SQUARE THROAT, NOSE AND EAR HOSPITAL, London, W.1.

Applications are invited for the post of HONORARY ASSISTANT DENTAL SURGEON. Candidates, who should be Licentiate in Dental Surgery (R.C.S.), should apply on or before February 28th, 1938, to the undersigned, stating age and experience, and sending copies of testimonials.

F. P. CARROLL,
Secretary-Superintendent.

HOSPITAL FOR DISEASES OF THE SKIN, Blackfriars.

The Committee of Management will shortly appoint an additional member of the HONORARY STAFF. Candidates must either be Members of the Royal College of Physicians (London) or Fellows of the Royal College of Surgeons (England).

Applications, with testimonials in support, must be sent before March 15th to L. MUNDY, Secretary to the Hospital for Diseases of the Skin, 71, Blackfriars Road, S.E.1, from whom any further information may be obtained.

HOSPITAL FOR DISEASES OF THE SKIN, Blackfriars.

Applications are invited for positions as CLINICAL ASSISTANTS. Preference will be given to those with dermatological experience.

Applications, with testimonials in support, must be sent before March 15th to L. MUNDY, Secretary to the Hospital for Diseases of the Skin, 71, Blackfriars Road, S.E.1, from whom any further information may be obtained.

THE ROYAL WATERLOO HOSPITAL FOR CHILDREN AND WOMEN, Waterloo Road, S.E.1.

ANAESTHETIST. There is a vacancy for an Anaesthetist (male) at the above hospital. Honorarium £52 per annum.

Applications, accompanied by three testimonials, should be sent to the Secretary at the Hospital not later than February 16th.

Practices and Partnerships for Disposal (continued).

25 MIDLANDS, Cathedral City.—Old-established non-dispensing PRACTICE, averaging £1,550 p.a. Small panel. Visits 6/- to 10/6. Convenient house (about 6 bedrooms), in best residential part to rent at £65 p.a. Excellent prospects for one experienced in clinical pathology. Premium one and a-half years' purchase.

26 DEATH VACANCY.—CUMBERLAND.—Old-established good-class non-dispensing PRACTICE, over £700 p.a., in rapidly growing town. No panel. Large house for sale or rent. Good scope.

27 S. OF ENGLAND.—SURGICAL PARTNER required in good-class Practice in first-rate residential district. Applicant should be aged 30/35 or thereabouts, must hold the English Fellowship and be prepared to do some general practice. Modern up-to-date hospital. Share about £1,000 p.a. at first at two years' purchase.

28 BRITISH WEST INDIES.—SURGICAL PRACTICE in favourite town. Cash receipts, 1937, £1,900. Fine opportunity for experienced surgeon. Well-equipped nursing homes, X-ray and laboratory facilities. Rent of consulting rooms £5 monthly, and house £12 monthly. All kinds of sport. Premium £500.

29 S.E. COAST.—Old-established middle and working-class PRACTICE, about £950 p.a., in favourite summer resort. Clubs worth about £130 and panel about 1,490. Detached corner house (5 bed and dressing-rooms), with large garage and about half-acre of garden, for sale. Scope. Premium one and three-quarter years' purchase.

30 LONDON, N.W.—Old-established PRACTICE doing over £1,100 in residential district under ten miles from Marble Arch. Select panel 303. House (5 bedrooms), with large garden and garage. Price freehold, £2,750, or rent £150 p.a. Scope. Premium £2,000.

31 NEW ZEALAND.—Eye, Ear, Nose and Throat PRACTICE in a most important commercial city. Cash receipts last year, £2,277. Expenses light. Premium £2,460 cash or £2,600 terms (English currency). Purchaser should be at least 30 years of age with experience.

32 SEASIDE TOWN, within an hour of London.—Very old-established PRACTICE about £625 p.a. Panel about 300. Nice detached house (5 bedrooms), with large garage and garden, for sale or rent. Good scope. Premium £1,000.

33 YORKS (N. RIDING).—Well-established country PRACTICE near small market town. Receipts, 1937, about £1,000. Panel 480 (approx.). Appointments £60. Fees 2/6 to £1 1s. Good house with 5 bedrooms, 3 reception rooms, etc., good garden and field, £65 p.a. Premium two years' purchase.

34 S. WALES.—Old-established PRACTICE, £765 p.a., in country district near coast. Appointments worth nearly £100 p.a. and panel about 360. Specially built house (5 bedrooms, etc.), with garage and garden, for sale. Very good prospects of increase. Premium one year's purchase.

35 S.W. OF ENGLAND.—Country PRACTICE, averaging £2,500 p.a., easy distance of coast (appointments and panel return about £650 p.a.). Large house (3 reception, 6 bedrooms, etc.), in grounds of four acres, including orchard. Price £3,200. Hunting, golf, etc. Premium one and three-quarter years' purchase.

36 W. OF ENGLAND.—Old-established middle-class PRACTICE, about £1,400 p.a., in good town. Selected panel about 300. Visits 5/- to £1 1s., medicine extra. Very convenient and well-situated detached non-basement house (7 bedrooms), with nice garden and large garage, to rent. Premium one and a-half years' purchase.

37 EASTERN COUNTIES.—Country PRACTICE, averaging £1,750 p.a., within easy distance of county town. Panel 1,070. Good house (in 2½ acres) with 7 bedrooms, etc., garage, company's water and main drainage. Price £2,000 freehold. Premium two years' purchase.

38 S. COAST.—PARTNERSHIP in mixed Practice, averaging £2,600 p.a., in seaside resort. Panel about 2,000. Semi-detached house (5 bedrooms, etc.), with good garden, for sale or rent. Excellent hospital. Scope for major surgery. Premium one half-share two years' purchase.

39 W. OF ENGLAND Inland Waterring Place.—Old-established good-class easily worked PRACTICE. Receipts past year, £722. No panel. Practically non-dispensing. House with 6 bedrooms, etc., large garage and small garden, to rent on lease. Premium £1,000.

40 LONDON, E.1.—Old-established PRACTICE of about £800 p.a., including appointments about £150 p.a. and panel 1,300. Good house (6 bedrooms, etc.), to rent or purchase. Very good scope for increase. Premium £1,600, to include contents of surgery and waiting room, etc.

41 NORTHERN IRELAND.—Middle and working-class PRACTICE in suburb of important seaport. Receipts past year, £963. Panel nearly 1,200. Well-situated house (5 bedrooms), garage, etc., to rent. Practice capable of expansion. Premium £1,400.

42 HOME COUNTY.—PARTNERSHIP in country town Practice, averaging over £4,000 p.a. (increasing), within 25 miles of London. Good appointments and panel about 2,000. Suitable house obtainable. Incoming partner should not be over 30 and must have had one year's P.G. work. One-fourth share at first at two years' purchase.

43 MIDLANDS.—Unopposed country PRACTICE in very pleasant hunting district. Cash receipts last year, £1,097, including good appointments and panel about 500. Well-built house (5 bedrooms, etc.), with good garden and garage. Main electric light and water supply. Price £1,100 freehold. Golf, etc. Premium £1,600.

44 MIDLANDS.—Easily worked PRACTICE in very attractive village about 70 miles from London. Cash receipts, 1937 (to November 25th), £696. Panel 500. Detached modern house (4 bed and dressing-rooms), gas, electricity and main drainage, garden over an acre. Price freehold, £1,500. Premium one and a-half years' purchase, to include stock of drugs.

45 AUSTRALIA.—PRACTICE in small township in Victoria. Receipts last year, £850. Specially built house to rent at £20 p.a. Good climate. All kinds of sport. Premium, £500 English currency, including drugs and dispensary fittings.

46 SURREY.—PARTNERSHIP in sound old-established and steadily increasing Practice, averaging £4,445 p.a., in outlying residential suburban district. Panel 2,000. Visits 3/6 to 2/1-. Suitable house obtainable. Premium for share of 11/39ths £2,500.

Purchasers can raise additional capital for the purchase of approved practices or shares. Particulars will be forwarded on application.

The maximum commission payable on the sale of any Practice or Partnership in Great Britain placed exclusively in the hands of this Agency is £50 (fifty pounds), which sum covers goodwill, drugs, surgery fittings, fixtures and furniture, instruments and book debts, but not house property. Schedule of Terms will be forwarded on application.

Accountancy and legal services furnished by the Agency, where desired, at moderate inclusive charges. No charge is made to Principals for the introduction of Locum Tenens or Assistants.

1. WITHIN 100 MILES NORTH OF LONDON.—COUNTRY TOWN.—Old-established chiefly non-panel better-class PRACTICE averaging over £2,000 p.a. Fees 5/- to 21/-. Good house with ample accommodation. Premium 2 years' purchase.
2. EAST ANGLIA.—PLEASANT COUNTRY AND MARKET TOWN.—Old-established non-panel PRACTICE producing nearly £1,000 p.a. with good scope. Suitable house with ample accommodation on rental. Premium 1 year's purchase.
3. COUNTRY TOWN WITHIN 50 MILES OF LONDON.—A ONE-FIFTH SHARE (after short preliminary assistantship) is offered in well-established practice producing nearly £5,400 p.a. with large panel. Suitable house on rental. Premium 2 years' purchase.
4. NORTH LONDON.—Well-established PRACTICE producing nearly £2,000 p.a. including panel and appointments. Suitable house available.
5. LADY DOCTOR'S PRACTICE.—OUTLYING EASTERN SUBURB.—Increasing PRACTICE producing at present £1,070 p.a. including panel of 700. Suitable house. Premium 2 years' purchase.
6. BORDERS OF CAMBS. AND NORFOLK.—Old-established country PRACTICE producing between £1,250 and £1,300 p.a. including panel of about 800 and appointments worth nearly £200 p.a. Good house in nearly an acre of garden (3 reception, 6 bedrooms, Professional accommodation, etc., electric light, garage). Rent on lease £70 p.a. Premium 2 years' purchase. Illness reason for sale.
7. LONDON.—WESTERN DISTRICT.—Old-established PRACTICE held by vendor 12 years. Gross receipts last year £2,335. This year state of about £3,700 p.a. Panel of 1,550 to 1,500. House in good position on rental. Premium 2 years' purchase.
8. SOUTH DEVON.—COAST TOWN.—Well-established PRACTICE producing last year over £1,000 (this year at rate of about £1,200 p.a.). Freehold house with 2 reception, 6 bedrooms, etc., for sale or might rent. Premium 1 year's purchase.
9. SOUTH-WEST COUNTY.—A ONE-SIXTH SHARE is offered in old-established Practice producing nearly £7,000 p.a. Incoming partner must have made a special study of medicine and preferably hold the M.R.C.P. or have held a medical registration. Short preliminary assistantship. Suitable house available. Premium 2 years' purchase.
10. SOUTH WELSH COAST.—PARTNERSHIP.—A ONE-HALF SHARE in old-established Practice producing over £3,000 p.a. Large panel. Very good house. Freehold for sale. Premium 2 years' purchase.
11. EASTERN COUNTIES.—A QUARTER SHARE (with increase later) after preliminary assistantship of about 3 months. Practice producing over £4,600 p.a. 11 appointments. Very nice house available 2 years' purchase.
12. MIDDLESEX.—Recently established PRACTICE producing £700 p.a., with considerable scope. Very nice house on rental. Premium £1,250 or near offer.
13. LONDON, EAST.—Exceptionally sound chiefly working-class PRACTICE producing about £1,200 p.a., over £1,000 from Panel and appointments. Suitable house, rent £100 p.a.
14. NEAR BIRMINGHAM.—A ONE-THIRD SHARE (after preliminary assistantship) is offered in sound steadily increasing mixed-class Practice producing £3,700 p.a. Panel of nearly 5,000. Premium 2 years' purchase.
15. LONDON, SOUTH-WEST.—Middle and working-class PRACTICE. Receipts last year £705 p.a. Panel of 940. Suitable house, rent £75 p.a. Premium 2 years' purchase or near offer.
16. PARTNERSHIP.—A TWO-FIFTHS SHARE, with increase to one-half later, is offered in old-established good country Practice within about 70 miles of London. Gross receipts for past 12 months approximately £5,500 p.a., including large panel. Moderate expenses. Very nice house with ample accommodation and all modern conveniences. Freehold for sale or might be rented. Premium 2 years' purchase.
17. NORTH WALES.—(Welsh not essential).—Old-established unopposed country PRACTICE in very pleasant district averaging for past 3 years approximately £2,000 p.a., of which over £600 p.a. is from panel and about £295 from appointments and clubs. Very convenient house in excellent repair, with electric light, garage, etc. Price for freehold, £1,500. Premium £3,600. Partnership introduction will be given.
18. LIVERPOOL.—Old-established PRACTICE producing about £1,500 p.a., including panel of 1,300 and appointments worth about £170 p.a. Good house in excellent position. Premium for Practice and house £3,500 (or house might be rented).
19. SURREY.—DEVELOPING TOWN.—Increasing PRACTICE producing for last year £655 and believed to offer considerable scope. Panel of about 450. Well-built semi-detached freehold house with 6 bedrooms, etc., or smaller house available if wished. Premium 14 years' purchase.
20. SOUTH-WEST OF ENGLAND.—COUNTRY TOWN.—A ONE-HALF SHARE is offered in old-established Practice producing over £1,400 p.a., but believed to be capable of considerable increase with the aid of an energetic partner. Panel of about 1,100 patients. Very good house with 2 reception, 4 bedrooms, etc., and all modern conveniences. Garden of about 1 acre. Premium for share and house, £2,500.
21. NORTHERN OUTSKIRTS OF LONDON.—PARTNERSHIP.—A ONE-THIRD SHARE (after preliminary assistantship) is offered in unopposed country PRACTICE producing last year stated to be £2,162 p.a. Receipts for last year £1,100. Appointments worth about £200 p.a. Suitable house with 2 reception, 3 bedrooms, etc. Premium £1,800.
22. NORTH LONDON.—Old-established mixed-class PRACTICE, averaging for past two years about £2,800 p.a. Panel of over 2,600. Suitable house with 2 reception, 4 bedrooms, small garden. Rent on lease £104 p.a. Premium 2 years' purchase.
23. CARLISLE.—DEATH VACANCY.—Better-class non-panel PRACTICE, averaging about £700 p.a. House can be rented. Offers invited.
24. SCOTLAND.—UNIVERSITY CITY.—Old-established non-dispensing PRACTICE producing about £520 p.a., including £540 from Panel and £70 from appointments. Suitable house, 2 reception, 6 bedrooms, etc. Freehold £900, part on mortgage. Premium 11 years' purchase or near offer.
25. LONDON.—Residential District.—Long-established good general class PRACTICE producing over £1,000 p.a., with a full panel. Good house with ample accommodation, garden and garage. Freehold for sale or might be rented. A good introduction will be given.
26. WITHIN 12 MILES OF CHARING CROSS.—Steadily increasing PRACTICE producing last year over £1,650. Panel of over 1,000. Easily worked. Low expenses. Compact house, garden and garage. Premium 2 years' purchase.
27. SOUTH COAST SEAPORT.—Old-established mixed-class PRACTICE producing for past year over £3,000. Panel about 1,600. Various appointments. Well situated modern house, 3 reception, 5 bedrooms. Central surgery rented at £60 p.a., part sublet. Premium 2 years' purchase.
28. SOUTH COAST.—FAVOURITE TOWN.—Old-established PRACTICE producing over £1,700 p.a. Panel of about 1,500. Appointments about £50 p.a. Scope for increase. Presence of 12 social appointments. Low expenses. Suitable house with garden and garage on lease. Premium 2 years' purchase, to include book debts and drugs.
29. DORSET COAST.—PARTNERSHIP.—A ONE-THIRD SHARE, with increase later in a well-established Practice averaging about £3,000 p.a. Panel of over 2,700 and P.M.S. about 1,000. Various appointments producing £250-300 p.a. Low expenses. Suitable house with 5 bedrooms, etc., can be purchased or rented. Premium 2 years' purchase.
30. NORTH LONDON.—Well-established middle and working-class PRACTICE producing about £600 p.a., but offering considerable scope, especially for Panel, which has only recently been started. Suitable accommodation available on rental. Reasonable offer for quick sale vendor taking up appointment.
31. NORTH LONDON SUBURB.—Recently established PRACTICE in fast developing area. Receipts last year about £720, including Panel of about 200 patients. Architect-built modern house with ample accommodation. Freehold for sale. Premium £350 or near offer.
32. GLOS.—Sound old-established PRACTICE in beautiful country district averaging for past 4 years about £1,300 p.a. Panel over 1,600. Appointments about £89 p.a. Good house in own grounds. Freehold for sale. Premium 2 years' purchase.
33. LONDON, EAST.—Exceptionally sound old-established PRACTICE in populous area averaging for past 3 years over £2,240 p.a. Panel of approximately 3,500. Suitable house with excellent professional accommodation can be rented at £1176, including £452 from a Panel of about 1,150 patients.
34. LANCs.—SEASIDE RESIDENTIAL TOWN.—Early worked, mostly non-dispensing PRACTICE producing about £1,000 p.a., including panel of about 325. Low expenses. Suitable house available with consulting and waiting rooms, 2 reception, 3 bedrooms, maid's room, etc. Large garden. Garage. For sale or can be rented. Premium 11 years' purchase.
35. LEEDS.—PARTNERSHIP with succession in 6 or 12 months. A 2 1/2 days share is offered in an old-established Practice which has been held by the vendor, who is now specialising, for the past 2 years. Receipts for last year amounted to £1,176, including £452 from a Panel of about 1,150 patients. Suitable house available, freehold £900. Premium 11 years' purchase.
36. WEST OF ENGLAND.—Good-class residential town.—A ONE-THIRD SHARE with increase up to one-half is offered in a better middle-class Practice at present averaging £1,200 p.a. Appointments worth about £350. Panel of 300 patients. Fees 5/- to 21/-. Flat available in vendor's house for single man. Rent £40 p.a., inclusive of rates.
37. NORTH WALES.—Good-class long-established PRACTICE in very attractive residential and seaside resort. Cash receipts for last 16 years over £12,000 every year. Panel 425. Good house with 2 small gardens to rent or purchase freehold. Socially very pleasant. Premium £1,500.
38. EAST ANGLIA.—Within reach of two good towns. Old-established unopposed country PRACTICE averaging over £1,000 p.a., including Panel producing over £450 p.a. Low expenses. Detached house with 2 sitting and 5 bedrooms, etc. Rent £70 p.a. Premium £1,750.
39. NORTH CORNWALL.—Country PRACTICE in picturesque district near coast and within easy reach of two good towns. Stated to produce nearly £1,000 p.a., including Panel of £320.
40. WITHIN 25 MILES OF LONDON.—PARTNERSHIP, with surgical scope. A one-third share, with increase later, is for disposal in an old-established Practice, producing about £4,500 p.a. Fees 3/6 to 21/-. A suitable house can be secured. Incoming partner must have a Fellowship, be experienced and not over 35 years of age. A preliminary assistantship is offered.
41. WEST COAST.—Well-established PRACTICE, producing about £1,900 p.a., including Panel of 1,450. Suitable house on rental at £50 p.a. Premium 11 years' purchase.
42. SURGICAL PARTNERSHIP in delightful district within easy reach of London. A fifth partner is required in an old-established Practice. There is little visiting done under 10/6, although the patients come from all classes. Incoming partner, who must hold the Fellowship, would do all the surgery for the firm, but must be prepared to do general practice as well. Choice of houses.

The Agency has made arrangements for special facilities, on very favourable terms, to be afforded to approved purchasers for the advance of part of the premium for any suitable practice or partnership. Full details on application.

BELLERGAL

INHIBITS AUTONOMIC HYPEREXCITABILITY

Experimental and clinical investigations by Jöres and Goyert (1936)—*Fortschr. Ther.* 12, 159.

OCULOCARDIAC REFLEX, DERMOGRAPHISM, RESPIRATORY ARRHYTHMIA BEFORE AND AFTER BELLERGAL TREATMENT

Before Bellergal Treatment			After Bellergal Treatment		
Oculocardiac Reflex	Dermographism	Respiratory Arrhythmia	Oculocardiac Reflex	Dermographism	Respiratory Arrhythmia
- 6 + 13 ++ 1	r 15 w 4 r + w 1	- 2 + 17 ++ 1	- 17 + 3 ++ 0	r 19 w 1 r + w 0	- 19 + 1 ++ 0

Under oculocardiac reflex, ++ signifies not only slowing but also weakening of the pulse. Under dermographism, r = red, w = white, r + w = white dermographism with red margin.

"It is seen that the oculocardiac reflex was negative in only 6 cases before treatment with Bellergal but in 17 cases after treatment; white dermographism was observed in 4 cases before but only in one case after treatment; respiratory arrhythmia, present in 18 cases, disappeared except in one case."

RESPONSE OF THE BLOOD PRESSURE TO AUTONOMIC STIMULANTS BEFORE AND AFTER BELLERGAL TREATMENT

In subjects with a labile autonomic nervous system, Bellergal diminishes the exaggerated reactions, especially of the diastolic pressure, to stimulants of the autonomic nervous system such as adrenaline and pilocarpine. It also inhibits the action of adrenaline and pilocarpine on the pulse, temperature, oculocardiac reflex, dermographism and respiratory arrhythmia.

"Clinically, 40 cases exhibiting marked irritability of the autonomic nervous system were treated with Bellergal. They included a series of neurogenic disorders of various forms, nervous heart troubles without organic basis, stomach troubles of the ulcer type without an ulcer being demonstrable, ulcer and spastic constipation. By treatment commencing with 2 tablets of Bellergal three times daily, gradually decreasing to small doses, we obtained in all cases a marked improvement and even complete disappearance of the symptoms in the majority of cases. Secondary effects were never observed. The preparation may truly be described as a very effective remedy for the sedation of numerous conditions of hyperexcitability of the autonomic nervous system."

WINTER ILL-HEALTH AND ALKALI RESERVE

One teaspoonful of Eno's 'Fruit Salt' is equal in alkalizing value to eight ounces of orange juice.

Every doctor knows of the increase in illness during winter. This is partly due to lessened sunlight, the influence of cold, and also our "winter habits," but it is not the full story.

The average winter dietary differs from the summer one. Bread, meat, etc.—all acid-forming—largely replace salads and fruits. It is true the former have higher calorific value, but climatic circumstances throw an added strain on our acid-neutralising mechanism just when neutralising foodstuffs are more difficult to obtain.

We know that measurable decreases in the alkalinity of the blood plasma are impossible without serious disease; but it seems to be proved that varying degrees of ill-health follow on any serious reduction of the alkali reserve.

Thus is explained the relief given in many forms of ill-health by substances which increase the alkali reserve of the body and, by promoting elimination, lessen the absorption of protein decomposition products. Herein, also, lies the explanation that Eno's 'Fruit Salt' often proves of the highest value in threatened acidosis. A series of researches by a distinguished bio-chemist has proved that one teaspoonful of Eno is equal in alkalizing value to eight ounces of orange juice. One daily dose of Eno's 'Fruit Salt' will often be found sufficient to counter the ill-effects of an unduly acid-forming diet. Eno does not contain sugar, and, therefore, no restrictions need be placed on its general use.

ENO'S 'FRUIT SALT'

The words 'Eno' and 'Fruit Salt' are registered trade marks.

AN IMPORTANT NEW WORK

IN THREE VOLUMES

VOLUME I. Pp. xii + 590. With 398 Illustrations. Crown 4to. 50s. net. READY MARCH 1
VOLUME II. Pp. xii + 456. With 307 Illustrations. Crown 4to. 42s. net. NEARLY READY

It is expected that Vol. III will be about the same size and price as Vol. II.

CINERADIOGRAPHY. RUSSELL J. REYNOLDS.

The object of this text-book is to provide within reasonable limits a comprehensive survey of the present position of X-ray diagnosis. Diagnostic radiology is becoming an increasingly complex speciality, and it is difficult for one person to be equally expert in all its branches. The Editors have secured the help of collaborators, both radiological and clinical, who are distinguished in particular branches of the subject. It is hoped it will be of value not only to the post-graduate student of radiology, but also to the clinician.

The Illustrations. It would not be possible, even in a work of this size, to illustrate every condition demonstrable by radiology, but the illustrations provided are, it is hoped, representative, and give due emphasis to the common lesions met with in radiological practice. The greatest possible care has been taken in the preparation of the blocks, the selection of the paper, and also in the printing, the aim being to produce a worthy record of British work in the field of Radiology.

Prospectus of the work, with a Summary of Contents, Specimen Pages and Order Form, post free on application. Orders may be placed through any bookseller.

APPROVED LABORATORY TECHNIQUE

CLINICAL, PATHOLOGICAL, BACTERIOLOGICAL, MYCOLOGICAL,
PARASITOLOGICAL, SEROLOGICAL, BIOCHEMICAL, AND
HISTOLOGICAL

BY

JOHN A. KOLMER, M.D., and FRED BOERNER, V.M.D.

With 28 Distinguished Contributors and Collaborators.

The *New Second Edition*, which embodies the latest procedures, is practically indispensable to the laboratory worker who wishes to keep abreast of the times and to be familiar with the newest developments in this field. The book has been thoroughly revised and most chapters have been entirely rewritten with the aid of 28 prominent contributors and collaborators.

Special emphasis has been placed on Parasitology; extended attention has been given the important subject of Mycology, and there are new and significant chapters on: Methods for Hormonal Diagnosis of Early Pregnancy, Hydatidiform Mole, Chorionepithelioma, and Teratoma of the Testis; Diagnostic Mycological Methods; Methods of Examination of the Skin and Mucous Membranes for Animal Parasites; Methods for Conducting Tests for Allergy, and Histological Methods and the Preparation of Museum Specimens.

EMERGENCY SURGERY

By **HAMILTON BAILEY, F.R.C.S.(Eng.)**

REVIEWS FROM PREVIOUS EDITIONS.

"Mr. Bailey has achieved a great feat in writing this book, and many generations of medical men will thank him for it . . . We do not see how this book could be bettered in any way."—*Medical Press and Circular*.

"Mr. Hamilton Bailey has just cause to be proud of this volume, which can claim to be equal, and in many ways superior, to any book on the subject published hitherto."—*British Medical Journal*.

"Surgeons in the earlier stages of their emergency experiences will find this book an excellent guide."—*Lancet*.

Sixth Fully Revised Edition. 284 pages. With 358 Illustrations, some of which are in Colour. 21s. net, post 6d.

DEMONSTRATIONS OF PHYSICAL SIGNS IN CLINICAL SURGERY

By **HAMILTON BAILEY, F.R.C.S.(Eng.)**

"It is almost unnecessary to say anything in recommendation of this well-known work, though it is a pleasure to record once again that it fully maintains the very high standard of its predecessors."—*Brit. Jour. of Surg.*

"This excellent book has already received such a measure of praise from reviewers, and such obvious welcome from readers, that to extol it further would be a work of supererogation."—*British Medical Journal*.

MEDICAL CLINICS of NORTH AMERICA

PNEUMONIA

(A 9-Clinic Symposium)

and in ADDITION

There are 13 other Practical Clinics in the January Number

The SYMPOSIUM on PNEUMONIA

Pathogenesis of Pneumonia—by Dr. F. D. Gunn, *Northwestern University*

Infecting agent, route of infection, predisposing factors in the host, mechanism of development of lesion, mode of extension.

Early Diagnosis and Specific Treatment of Lobar Pneumonia—by Dr. Wheelan D. Sutliff, *University of Chicago*

Symptoms, physical signs, X-ray examination, pneumococcus cultures and typing, serum therapy, precautions, dosage.

Pulmonary Disease Secondary to Amebiasis—by Drs. Robert W. Keeton and Marion Hood, *University of Illinois*

Symptoms, examination, treatment

Diagnosis and Differential Diagnosis of Pneumonia—by Dr. Edmund F. Foley, *Research and Educational Hospital*

Anatomic diagnosis, diagnosis from standpoint of prognosis, location and extent of involvement, toxemia, untoward conditions which influence the outcome, differential diagnosis, similarity of onset, pneumonia presenting exaggerated symptoms, confusing physical findings.

Differential Diagnosis of Pneumonia in Childhood—by Dr. Arthur H. Parmelee, *Presbyterian Hospital*

Medical Diathermy in Pneumonia—by Dr. John S. Coulter, *Illinois Central Hospital*

Treatment of Empyema—by Dr. Willard Van Hazel, *St. Luke's Hospital*

Diagnosis, open and closed drainage.

Use of Oxygen in Pneumonia—by Dr. Ford Hick, *Research and Educational Hospital*

Causes of oxygen want in pneumonia, breathing in pneumonia, symptoms of oxygen want in pneumonia, recognition of presence of oxygen want, difficulty in compensation for oxygen want, control of fever, time for use of oxygen, carbon dioxide inhalations in pneumonia, methods of giving oxygen.

So-Called "Unresolved Pneumonia"; Bronchoscopic Aspects—by Dr. Paul H. Holinger, *Research and Educational Hospital*

Medical Clinics of North America. Issued serially, one octavo of about 200 pages, illustrated, every other month. Per year 16 consecutive bimonthly numbers: Cloth, 75s. net; paper, 55s. net. These Clinics are sold only by a year of six consecutive bimonthly numbers.

LEMBAR JUSTIFIES THE DOCTOR'S HIGHEST RECOMMENDATION

"A most pleasant and effective help for a variety of illnesses," writes a doctor. "The best drink of its kind," states a nurse. Lembar has been tested and approved by a leading London Hospital. Prescribe it for any condition in which lemon juice and barley water are allowed.

RAYNER'S LEMBAR

Made from finest fresh lemons, good Scotch barley and Glucose (with cane sugar). More economical than ordinary lemon and barley drinks. *A bottle makes a gallon.* It keeps indefinitely.

SAMPLE sent with pleasure, also useful booklet with special diet sheets and sickroom recipes from a London Hospital. Write to Rayner & Co., Ltd., Medical Dept. B, London, N.18.

2/- a bottle at all leading chemists and grocers.

OF INTEREST TO EVERY MEDICAL PRACTITIONER

A proper understanding of Physical Medicine is becoming increasingly essential in everyday practice.

THE . . . British Journal of Physical Medicine

is the only British Journal dealing exclusively with Physiotherapy, which includes Actinotherapy, Electrotherapy, Radiotherapy, Manipulation, Remedial Exercises, Massage, Diet, etc.

In view of the rapidly increasing recognition of the importance of Physical Medicine, the Journal has been considerably altered both with regard to its editorial matter, and also in size, format, and typography. The new British Journal of Physical Medicine, while, as in the past, providing its readers with the latest and most authoritative opinions on all matters appertaining to physical medicine, includes shorter, essentially practical articles, and a variety of other information designed to be instructive to the general practitioner.

Single copies, 2/- post free.
 Annual Subscription, 21/- post free.

MACMILLAN

PEDIATRIC UROLOGY

By Meredith F. Campbell

M.S., M.D., F.A.C.S.

Professor of Urology, New York University College of Medicine

With a Section on Bright's Disease in Infancy
 and Childhood by John D. Lyttle, A.B., M.D.

2 Vols. With over 1,350 Illustrations. £3 3s. net

The aim of this work is to indicate the clinical aspects of the urologic diseases in infants and children.

"This work, which is a cross-cut of medicine and surgery, is very readable and the extensive quotations from clinical records kept by the authors add to its practical interest."

—The Lancet.

"A marvellously complete and well-written treatise. . . . We can strongly recommend these volumes. . . . We predict that this work is destined to become a medical classic."

—Medical Times.

AND

COMMENTS

A practical dissection manual designed to supply the student with all that he requires while omitting all that is superfluous. The whole subject is covered in two handy volumes, each separately indexed. "A complete dissection guide for a guinea."

Deals with diagnosis, prognosis, and differential diagnosis from the radiological aspect. Includes chapters on collapse therapy and industrial diseases of the lung. Illustrated with 60 explanatory radiograms of typical and special cases, beautifully reproduced.

"A classic work, magnificent in conception and delivery . . . Its presentation is excellent from every point of view. . . . Erudition, experience, humour, philosophy, and common sense are written large on every page."

Int. Obstet. & Gynec.

"Without doubt this is the most practical and quite the most useful book on this subject that has so far been published."

Medical Press and Circular.

"Holds a well-merited and firmly established place among British textbooks of Anatomy. . . . it contains a fund of information not included in any book of the same category."

British Medical Journal.

The first book in England wholly devoted to this subject. Deals with the principles of occupational therapy and with methods of organising and applying it through crafts and other activities. Invaluable to all concerned with the welfare of the mental patient.

"We cannot praise too highly the manner in which this work has undergone revision. It now constitutes the most completely up-to-date textbook of surgery available."

Medical World.

Duo-Therapy sunshine for your patients -

There is no reason why you should go without the benefits which actino-therapy brings to both physician and patient. But your results depend largely on effective apparatus. No skill or study will enable you to overcome self-imposed defects due to inadequate or outworn equipment.

21 FEB - 4 MAR
OPTICAL & ELECTRIC EXHIBIT LONDON
SEE OUR EXHIBIT

**GRAND HALL,
OLYMPIA,
Stand A 656/660**

(Special facilities for
medical practitioners
desirous of visiting.
Write for particulars.)

Specify the Hanovia Duo-Therapy Unit and have a lamp which is always dependable, always ready for use, always constant in its high intensity of ultra-violet radiation. Remember that this Unit combines the most modern ultra-violet ray lamp (the self-starting electronic Alpine Sun) with the standard therapeutic infra-red lamp (the new Sollux, Model V). So the Duo-Therapy Unit enables you to supply any group and combination of rays needed for modern actino-therapy, in full therapeutic intensity, following the best technique, and using a dependable, responsive instrument.

This is why most practitioners now specify the Duo-Therapy Unit for their consulting rooms, and why so many users of older ultra-violet lamps avail themselves of our part-exchange terms for replacement with this up-to-date Unit.

The coupon is for your convenience

A HANOVIA PRODUCT

A comprehensive Guaranty, full operating instructions, technical aid when needed, a complete 185-page Handbook of Technique, and enrolment for special actino-therapy magazine are furnished free to every professional user of Hanovia equipment, anywhere in the British Empire

HANOVIA

TO HANOVIA, LTD., SLOUGH.

The du Maurier filter tip

stands for fitness . .

Smoking and fitness can be enjoyed together in du Maurier cigarettes. Every trace of irritant that might worry a sensitive throat is trapped in the five layers of the filter tip. No bits of tobacco can get past, but all the full flavour of the Virginia tobacco comes through — cool and smooth and fragrant. That holds good whether you prefer the cork tipped du Maurier (red box) or du Maurier medium with the plain tip (blue box).

du MAURIER

the perfect cigarette with the exclusive filter tip
TEN FOR SIXPENCE—TWENTY FOR ONE SHILLING

Mr. THERM (of Harley St.) says:

**'Gas fires keep you
warm, but leave the
air cool and fresh!'**

The ideal fire would be one which had no effect on the air which surrounded you, but warmed your body through and through (in much the way that the sun does in winter in Switzerland). A modern gas fire comes near that ideal, because it warms very largely by radiation. It emits an unusually large proportion of the shorter infra-red rays — the rays that are so beneficial because they penetrate without scorching. A modern gas fire projects a comforting glow of warmth through the room, yet never overheats or dries the air. And, of course, it keeps the air always on the move — actually changing the air in a room three or four times every hour.

ISSUED BY THE BRITISH COMMERCIAL GAS ASSOCIATION

'... in a variety of inflammatory conditions' - - - M.B.Ch.B.

A mass of evidence has accumulated since the introduction of S.U.P. 36 over twelve years ago testifying to its value in a wide range of inflammatory conditions. This range is indicated in a letter received recently from a physician, in which he states:—

'I have used S.U.P.36 ... with great success in a variety of conditions ranging from acute pleurisy to septicæmia, and some other types of inflammation such as ascending phlebitis and acute fibrositis of the shoulder muscles ...'

Any physician wishing to make a trial with S.U.P.36 is invited to write in for a sample and descriptive literature.

A New Magsorbent Product

Granules
and
Tablets**MAGSORBENT GLUCOSE**

(Regd. Trade Mark)

(Magsorbent Brand of Magnesium Trisilicate with Glucose.)

A pleasant carminative combination of pure medicinal Glucose (Dextrose) and Magsorbent, flavoured with the finest oil of Peppermint.

The preparation will be found of particular value in the treatment of Acidosis in children.

Its corrective action in acid conditions is compounded:

1. By neutralisation of the products of acid fermentation in the stomach and intestines.
2. By normalisation of fat metabolism and the prevention of ketosis.
3. By its sustained control of the reaction of the gastric juice.
4. By its powerful adsorption of intestinal toxins and its protection of the liver.

INDICATIONS

Acidosis, Ketosis, cyclical vomiting, Insulin reaction, also train, car, air, and sea sickness.

We Suggest that You Recommend THE ORIGINAL PINEAPPLE JUICE FROM HAWAII

THIS appetising fruit juice from Hawaii offers a sparkling change from routine fruit juice menus. Children especially like it. Because it is assimilated so easily it is ideal for babies. That is why, when your patients ask your advice about fruit juices, we suggest that you recommend Dole—the *original* Hawaiian pineapple juice. This delicious, golden juice is sealed in tins by the exclusive Dole Fast-Seal Vacuum-Packing Process. That is why Dole Pineapple Juice retains, in high degree, the fresh-fruit constituents of ripe pineapple, as well as the fragrant, field-fresh flavour. Also it is a natural source of vitamins A, B, & C. J. K. Husband & Co., Ltd., 10 Eastcheap, London, E.C.3.

Here is a typical Analysis of Dole Pineapple Juice:

Moisture	85.3%
Ash	0.4
Fat (ether extract)	0.3
Protein (N × 6.25)	0.3
Crude fibre	0.02
Titratable acidity as citric acid	0.9
Reducing sugars as invert sugar	12.4
Carbohydrates other than sugars (by difference)	0.38

THE SURF RIDER.—Surfing, the sport of Hawaiian kings in olden days, was one of the favourite pastimes. Owing to the way the surf breaks on the reef, Waikiki is the only place in the world where this sport is indulged in under ideal conditions.

It is a marvellous sight to see the upright gleaming brown bodies of the native surfers come riding swiftly shoreward on a giant comber.

P.S. Just write to us on your letterhead and we will be pleased to send you free a sample tin of delicious Dole Hawaiian Pineapple Juice.

Prevent the Cold and the attack of Influenza

The National Fitness Campaign is emphasising, among other things, the fact that adequate nutrition is essential for health. And there is ample proof to show that those who habitually take enough of the right kind of food are able to resist infection better than those whose diets are less well chosen.

It is well known that the modern diet tends to supply comparatively little of the B vitamins and that these factors play a special role in preventive medicine.

Marmite is prescribed extensively for it contains all the vitamins of the B group and has proved of particular value in combating winter illnesses.

Marmite served as a hot drink provides a popular means of fortifying the system. It helps to prevent illness, is beneficial to the patient, and is especially indicated during convalescence.

The MARMITE FOOD EXTRACT CO. LTD.,
35 Seething Lane, LONDON, E.C.3.

In jars: 1-oz. 6d., 2-oz. 10d., 4-oz. 1s. 6d., 8-oz. 2s. 6d., 16-oz. 4s. 6d. Special quotations for Marmite packed for use in hospitals, clinics, welfare centres, etc.

A + B + C + D

**All 4 vitamins needed for
healthy development**

'Nestrovite' is a well-balanced preparation containing vitamins A, B, C and D in definitely stated international units. It is recommended for aiding the growth of infants and developing children; for convalescence; for gastro-intestinal disorders; during pregnancy and lactation; and for combating lowered vitality in the Winter and Spring. The pleasant flavour will induce children as well as adults to take it regularly.

PLEASANT PROTECTION

'DETTOL' owes its ever increasing use to the fact that it combines high germicidal efficiency with cleanliness and pleasantness.

'DETTOL' can be used at really effective strengths without discomfort or even staining—marked advantages over

carbolic and cresylic antiseptics. Its high bactericidal power is maintained in the presence of blood and other organic matter.

'DETTOL' is a clean, clear, non-poisonous fluid, with a most agreeable odour.

Sold by chemists in bottles, 1/-, 1/9, 3/-, 5/- and 7/6; and in larger sizes for Medical and Hospital use. Sample, and full information on request.

LIVERPOOL and LONDON

Doctors who have tested them, believe in Baxter's Intravenous Solutions in Vacoliters.

1. They are made from protein-free water—hence of constant pH value.
2. Baxter solutions are non-pyrogenic; free from any anaphylactic reactions. One of England's leading surgeons has said in a recently published article "they never produce fever or thrombosis."
3. All solutions are biologically tested after sterilisation. The vacuum sealed Vacoliter is made of special glass, treated by a special process, which ensures the solutions remaining sterile indefinitely. To confirm this, master samples are kept which are periodically re-tested by independent clinical authorities of the highest ethical standing.
4. Instantly available. From the stock room to the patient's vein is a matter of moments. Administration is as simple at the scene of an accident as at the patient's bedside. No special equipment is required.
5. There are many ways in which intravenous therapy helps to make a patient a better "risk." Because of their qualities, Baxter solutions will ensure the maximum results in this direction.
6. Intravenous solutions are Baxter's entire business. Four laboratories produce annually more than 3 million litres. Many leading institutions, well equipped to make their own up to earlier standards, have signed contracts standardising Baxter solutions each year. Fewer hospitals continue to make their own solutions.

GONAD STIMULATION THERAPY IN MENSTRUAL DISORDERS

ANTOSTAB

Supplied in boxes containing ampoules of 100 mouse units, together with ampoules containing 1 c.c. of 0.90% Sodium Chloride Solution as a solvent for Antostab. Single ampoules and boxes of 6 ampoules.

ANTOSTAB is prepared from pregnant mares' serum and contains the follicle-stimulating factor which has a definite effect on the ovaries and in producing endometrial proliferation.

Clinical reports published in the *British Medical Journal*, 1937, November 6th, page 904, show that in cases of amenorrhoea, the menstrual cycle may be re-established by treatment with Antostab and that following treatment the menstrual rhythm continues normally.

PHYSOSTAB

Supplied in boxes containing ampoules of 100 mouse units, together with ampoules containing 1 c.c. of 0.90% Sodium Chloride Solution as a solvent for Physostab. Single ampoules and boxes of 6 ampoules.

PHYSOSTAB is prepared from human pregnancy urine and contains the luteinising hormone.

It is of value during the second half of the menstrual cycle when it stimulates the production of corpora lutea.

Successful results have been obtained with Physostab in the treatment of undescended testicles and of dystrophia adiposogenitalis.

North Circular Road, LONDON, N.W.2, and 19, Temple Bar, DUBLIN

FOR EFFECTIVE CONTROL OF PAIN

AMONG the many and diverse analgesics which have been evolved by modern chemical research, acetyl-salicylic acid retains its reputation as one of the safest and most effective. Its tendency to liberate salicylic acid—the irritant properties of which are well known to physicians—has, however, caused many to hesitate to employ it as widely as it deserves. Exhaustive trial in hospital and private practice proves that "Alasil" definitely solves the problem of administering acetyl-salicylic acid in an effective form, being free from the risk of irritating the stomach or bowels or of causing general reactions.

A supply for clinical trial with full descriptive literature sent free on request.

In "Alasil" the desirable therapeutic effects of acetyl-salicylic acid are well exhibited by its calcium acetyl-salicylate moiety, while the presence of "Alocol" (Colloidal Hydroxide of Aluminium), a powerful gastric sedative and antacid, obviates any tendency to gastric irritation. The superior absorbability of "Alasil" over ordinary salicylate compounds and its freedom from the risk of liberating free salicylic acid in the stomach have been well proved by careful experimentation. "Alasil" can be prescribed with perfect safety to patients of all ages and in larger doses than ordinary salicylate compounds.

Indian
The White Tara
(Goddess of Mercy)

"ALOCOL"

Colloidal Hydroxide of Aluminium

Improved Antacid Therapy

SODIUM BICARBONATE, bismuth salts and other time-honoured antacids having each proved to possess individual disadvantages, an agent such as "Alocol" which combines the best therapeutic features of these with intrinsic merits of its own, must be of interest to the physician.

"Alocol" is a powerful antacid agent which forms with the stomach contents a colloidal jelly with the power of adsorbing free hydrochloric acid, thus fixing it and eliminating it from the system. It has a remarkably soothing effect on the inflamed or irritated gastric mucosa and is, therefore, rapidly effective in relieving pain. Being non-absorbable "Alocol" is free from any risk of "alkalosis."

"Alocol" can be prescribed with confidence in all cases where alkaline therapy is indicated. Issued in tablet and powder form.

Complete chemical history of "Alocol" with convincing clinical reports and supply for trial, sent free to physicians on request.

IODINE OINTMENT

"IODEX"

BRAND

This ideal presentation of iodine is even more active than the Tincture, has greater inflammation-reducing, resolvent, and antiseptic properties, yet is entirely bland and non-staining, and it conserves unimpaired the vital qualities of the skin. "Iodex" can therefore be applied with perfect confidence wherever an iodine ointment can be of service, even upon mucous or extremely sensitive surfaces.

Method of Application.—Wherever possible, the ointment should be gently rubbed into the skin until its colour disappears. Where rubbing is inadmissible, it may be liberally applied under a light, loose bandage. Tight and air-excluding bandages should never be employed.

Samples sent to Medical practitioners on request.

MENLEY & JAMES, LTD., 64, Hatton Garden, London

TAMPAX

A NEW TAMPON FOR USE DURING MENSTRUATION

Many members of the medical profession consider Tampax more hygienic than other methods of caring for the menstrual flow. They also recognise that Tampax assures a comfort to women heretofore unknown.

Tampax is a tampon, worn internally, perfected by a physician for regular monthly use.

The wearer is unconscious of its presence. Binding belts, the discomfort of pins, and pads, chafing, are all eliminated. Menstrual odour is reduced to the minimum.

Each Tampax comes in its own applicator (complete in an individual sealed wrapper) assuring easy, hygienic insertion.

The tampon is made of highly absorbent sterilized surgical cotton, compressed by a patented process to one-third its original size—so that, while insertion is simplified, the

tampon expands when moist and can absorb approximately 1½ ounces.

A cord is sewed securely through the cotton, assuring easy and complete removal.

Measles Control with

IMMUNE GLOBULIN (HUMAN)

Lederle

BECAUSE of the frequency of complications, the mortality rate of measles is high—higher than that for whooping cough, diphtheria and scarlet fever.

Complications can be avoided by the use of IMMUNE GLOBULIN (HUMAN) *Lederle*, particularly those of broncho-pneumonia—responsible for about 50% of deaths in the infant age group (6 months to 3 years).

As a modification dose, one injection of 2 cc. is administered to patients in the infant age group from 6 to 8 days after exposure (for children in the same family this is 2 to 4 days after the appearance of rash in the exposing child). This dosage confers an active and lasting immunity in the majority of cases. For passive immunity of several weeks, a first dose of 2 cc. of IMMUNE GLOBULIN (HUMAN) *Lederle* is administered as soon as contact has been recognized; a second dose of 2 cc. four days later.

THE COMPARATIVE VALUE OF ADULT SERUM, CONVALESCENT SERUM, AND IMMUNE GLOBULIN PATIENTS TREATED FOR PROTECTION OR MODIFICATION

LIVERPOOL and LONDON.

Bronchitis, Winter Cough and Sequelæ

There is a vast amount of evidence of the most positive character proving the efficacy of 'Angiers' in sub-acute and chronic bronchitis. It not only relieves the cough, facilitates expectoration, and allays inflammation, but it likewise improves nutrition and effectually overcomes the constitutional debility so frequently associated with these cases. Bronchial patients are nearly always pleased with 'Angiers' and often comment upon its

soothing, "comforting" effects.

The unique soothing properties of 'Angiers,' its favourable influence upon assimilation and nutrition, and its general tonic effects, make it eminently useful both during and after influenza. It has a well-established reputation for efficiency in relieving the troublesome laryngeal or tracheal cough, correcting the gastrointestinal symptoms and combating the nervous depression and debility.

B.D.H. COMMON COLD VACCINES

The common cold is now regarded as being due to primary infection by a virus with secondary invasion by the organisms usually found in the upper respiratory tract. It is believed that these organisms which are normal inhabitants of the naso-pharynx may under certain conditions assume a pathological rôle.

No vaccine preparation against the infecting virus is at present available, and the value of the Common Cold Vaccines lies in their power to diminish the activity of the secondary invaders. Three vaccines against these invaders are prepared in the B.D.H. laboratories:

Common Cold Vaccine (Anticatarrrhal)
Influenza Vaccine (Mixed)
Influenza Vaccine (British Army Formula)

B.D.H. Common Cold Vaccine (Anticatarrrhal)

<i>N. catarrhalis</i>	200 million	} in 1 c.c.
<i>H. influenza</i> (Pfeiffer)	200 "	
Streptococci	400 "	
Pneumococci	800 "	
Staphylococci	400 "	
Bact. friedländeri (pneumobacillus)	200 "	

B.D.H. Influenza Vaccine (Mixed)

<i>H. influenza</i> (Pfeiffer)	1000 million	} in 1 c.c.
Streptococci	200 "	
Pneumococci	1000 "	
Staphylococci	200 "	

B.D.H. Influenza Vaccine (British Army Formula)

<i>H. influenza</i> (Pfeiffer)	60 million	} in 1 c.c.
Pneumococci	200 "	
Streptococci	80 "	

DOSAGE. The vaccines are generally used for prophylaxis, but they may be given in small doses as a therapeutic agent.

As a prophylactic a course of four injections is given: 0.25 c.c., 0.5 c.c., 1.0 c.c., 1.0 c.c. at weekly intervals.

Literature on request

THE BRITISH DRUG HOUSES LTD. LONDON N.1

Your patient has acute digestive trouble

You prescribe a strict diet. The patient must take nothing that can in any way aggravate his complaint. Milk and "slops" alone leave him depressed and weak.

When the digestion must be kept at rest, the unique stimulating properties of Brand's Essence are never contra-indicated. Brand's contains no meat fibre or any other irritant matter—precipitates no solids in stomach or intestines and is easily and quickly assimilated.

A copious flow of gastric juice is stimulated, but the acid is competently controlled at all times through adsorption by proteins. The Essence can safely be administered even in cases of gastric ulcer. Strength is maintained chiefly through Brand's protein-sparing action.

BRAND'S CHICKEN OR BEEF **ESSENCE**

is never contra-indicated

BRAND & CO., LTD., SOUTH LAMBETH ROAD, LONDON, S.W.8

POST-FEBRILE CONDITIONS

ENTERIC FEVER: By adding 'Sanatogen' to boiled and cooled milk the author found, in the dietetic treatment of typhoid (enteric) fever, that digestion and assimilation were easily accomplished, positive evidence being furnished by the steady improvement of his patients.

"Dietetic Treatment of Enteric Fever."

(PUBLIC HEALTH.)

INFLUENZA: "As a tonic-food 'Sanatogen' stands for pre-eminence. This is no mere expression of an individual opinion, but a fact firmly established by a vast array of clinical experience.... Whatever dietary may be decided on in the post-febrile period of influenza, it must always include 'Sanatogen.'"

(—M.D.)

DIPHTHERIA: "I am finding your Casein Glycerophosphate of great service to my patients in the Infectious Diseases Hospital, especially to Diphtheria cases who are put on it as a routine."

(—M.R.C.S., L.R.C.S., D.P.H.)

SCARLET FEVER: "I weighed, weekly, eleven children convalescent from scarlet fever to whom 'Sanatogen' was given, and fourteen other convalescent children of about the same ages, in as nearly as possible the same condition, living in hospital at the same time, and getting the same food. I found that the average gain in the weight of the children getting 'Sanatogen' was, in five weeks, 4 lbs. 2 ozs., and of those not getting 'Sanatogen' was just under 3 lbs. I have also weighed the same child at one time when not taking 'Sanatogen,' and at another when taking 'Sanatogen,' and I invariably found that the child improved considerably, and gained more weight when 'Sanatogen' was given in addition to its ordinary diet."

(THE PRACTITIONER.)

★ ★ ★ ★ ★ ★ ★ ★ ★ ★ ★ ★ ★ ★

"The bactericidal action of the blood and its naturally protective powers against diseases are developed by 'Sanatogen.' The combination of a glycerophosphate with albumin, as it exists in 'Sanatogen,' produces a true physiological influence on nutrition."

(BIRMINGHAM MEDICAL REVIEW.)

THE CLAUDEN AMPOULE IN THE DOCTOR'S BAG HAS SAVED MANY A PATIENT'S LIFE

STERILE CLAUDEN SOLUTION

for parenteral (and particularly intravenous) injection in cases of
internal haemorrhage.
In boxes of 1 ampoule each 10 c.c.
In boxes of 5 ampoules each 10 c.c.

STERILE CLAUDEN POWDER

for dusting on wounds, and insufflating into sinuses.
In boxes of 1 tube 0.5 grm.
In boxes of 3 tubes 0.5 grm.

CLAUDEN TABLETS FOR ORAL USE

In tubes containing 15 tablets of 0.25 grm.
In tubes containing 30 tablets of 0.25 grm.
Hospital sizes 100 and 300 tablets.

SOME REASONS for using

'BETAXAN'
TRADE MARK BRAND
VITAMIN B₁ (SYNTHETIC)

- (Daily requirements of Vitamin B₁ = 500 international units.
- (Ordinary mixed diet may contain this amount, but losses in cooking, defective absorption, or increased requirement may cause a state of latent hypovitaminosis.
- (Minor degrees of this are probably common. One symptom is *anorexia*. Constipation, *achlorhydria* and degenerative changes in the C.N.S. have also been associated with shortage of B₁.
- (Hence its use (often empirical) in many clinical conditions; especially *neuritis* and *neuralgia*.
- (In a group of 100 unselected cases of multiple and localised neuritis treated with Vitamin B₁, there were 44 "cures," 48 cases of improvement, and 8 failures.

A paddy field in Kuang, Selangor, from a photograph supplied by the Malay Information Agency. Rice polishings are a potent natural source of Vitamin B₁.

A composite photograph showing the Bayer Laboratories at Elberfeld, where Vitamin B₁ was isolated from yeast and later synthesised for the first time.

RELIGIO-MEDICAL SERIES, No. 145—ROMAN

Two interesting preparations for the medicine case and surgery

'MENTHOFAX' BRAND

COMPOUND METHYL SALICYLATE OINTMENT

Contains methyl salicylate, menthol, eucalyptol and oil of cajuput in a base of white beeswax and hydrous wool fat.

An excellent rubefacient. Exercises in a remarkably satisfactory way the full analgesic, local antiseptic and counter-irritant properties of the components. Superior to liniments.

Collapsible tubes, 12

'LUBAFAX' BRAND

STERILE SURGICAL LUBRICANT

Equally effective for hands and instruments. Does not injure the skin, neither has it any effect upon the metal or rubber parts of instruments. Water soluble, non-greasy.

Collapsible tubes, 1,3

ISIS AND SARAPIS, WORSHIPPED IN ASSOCIATION, WERE BY FAR THE MOST CELEBRATED OF THE FOREIGN DEITIES ADOPTED BY THE ROMANS. —Isis and Sarapis came to Rome from Alexandria. In spite of State opposition, the cult of Isis attracted large numbers of enthusiastic adherents, while Sarapis became a formidable rival to Æsculapius. Temples were raised in their honour where medical treatment was carried out by methods of incubation, ritual purification, divination, incantation and by general hygienic measures, including diet. Qualified physicians are also said to have contributed their knowledge and skill in treating the patients. Isis is here shown bearing the sign of her Egyptian origin—a sun's disk surmounted by plumes between the horns of Hathor—and carries a sistrum, which is broken. Before her stands her son Horus, and on her left Sarapis, sometimes called her husband, wearing the *modius* head-dress.

For Delicate Adults and Children

"Lixen" is an extract of senna prepared by a special cold process to allay the griping action. The absence of an after-constipating effect gives it a special value in habitual constipation, and its gentle, though efficient, action, together with its pleasant flavour, makes it particularly acceptable to women, children, elderly and delicate persons, and convalescents, for whom the finding of a satisfactory aperient is often difficult.

Descriptive literature and clinical sample will be sent on request.

EFFECTIVE ABSORPTION OF HORMONES

BY

A. S. PARKES, Sc.D., F.R.S.

(From the National Institute for Medical Research, London)

In the preparation of active extracts of the endocrine organs it has usually been found that very little of the active substance is contained in the gland compared with the amount which has to be injected to produce an effect in the test animal. This discrepancy is no doubt due largely to the fact that there is continuous secretion by the gland and little storage, so that the content at any given time may represent but a small fraction of a day's output. The amounts which it is necessary to administer are, however, often unnaturally high because of low efficiency resulting from the method of administration. The normal gland must be supposed to keep up a slow, steady secretion which maintains a threshold concentration in the circulation but avoids wasteful or harmful excess. The exogenous injected hormone, on the other hand, is usually absorbed rapidly and utilized, destroyed, or excreted. In these circumstances the concentration in the blood will be highest shortly after injection, and will then fall away till a sub-effective concentration is reached. In many cases there can be little doubt that this cycle occupies only a few hours, leaving the organism deficient of the hormone until the next injection. If the dose is raised so as to prolong the period during which effective amounts of the hormone are present, the wastage at the time of maximum concentration will be correspondingly greater. The effectiveness of a method of administration thus depends on the degree to which the necessary concentration in the blood can be maintained at a steady even level slightly above the threshold value. The problem of how to attain this end is one of the most important in endocrine therapy.

Oestrogenic Substances

The influence of method of administration on effectiveness was seen early in the work on ovarian extracts when Allen and Doisy and their co-workers (1924) found that a certain amount of active substance was more effective when given as a series of small doses than it was in one large dose. As preparations became more purified and semi-aqueous solutions were prepared, the advantage of divided dosage became very clear. Laqueur and de Jongh (1929) found that less than one-thirtieth of the active substance required to give a response as one injection was effective when given as six injections over thirty-six hours. Similar results were obtained by Allan *et al.* (1928), and Marrian and Parkes (1929). These facts are, of course, of importance from the points of view of both clinical dosage and biological assay.

The problem is further complicated by the fact that the various naturally occurring oestrogens are differently

affected by alteration of the method of administration. When oestrone and oestriol were first isolated from pregnancy urine no two observers agreed as to their relative activity. It was soon realized that this was due to the difference in the methods used for comparison and to the more rapid and less effective absorption of oestriol. At the first International Conference on the Standardization of Sex Hormones, held in 1932, a preparation of oestrone was established as an international standard for oestrus-producing hormones, but it was realized at the time that attempts to assay oestriol in terms of the international unit, defined as the specific activity of 0.0001 mg. of the oestrone standard, would lead to difficulties. The importance of the absorption problem was also recognized by a stipulation that, in assay work, absorption should be retarded either by the use of oily media or by multiple injections. The third of the important natural oestrogens—oestradiol—originally produced by reduction of oestrone but afterwards isolated from the ovary by Doisy, is more like oestrone in its behaviour than is oestriol: by the plumage test on brown leghorn capons it was not possible to demonstrate that it has a less prolonged action following a single injection than has oestrone. There is little doubt, however, that the activity relative to oestrone by the ordinary test on the ovariectomized rat or mouse may be influenced by the method of administration.

The necessity for multiple injections is shown to an increasing extent by oestrone, oestradiol, and oestriol, in that order. This is almost certainly due to increasing solubility in body fluids, and is in close relation to the number of hydroxyl groups present. The comparative inactivity of these compounds by mouth is probably caused by lack of absorption from the gut, since there is little evidence of destruction by the digestive enzymes. It might be expected that oestriol, the most water-soluble, would be the most active by mouth. The evidence available is concordant with this supposition (Rowe and Simond, 1936). Another method of administration, unction of an oily or fatty solution, tends to increase the duration of action of the hormone (Deanesly and Parkes, 1937), but the method is not efficient except where the responding structure is superficial and can be treated directly (as the mammary gland, comb, plumage, etc.). Even so, in the absence of detailed information, one must deplore the increasing tendency to add oestrogenic substances to face creams.

A method of obtaining optimum efficiency other than by multiple injections was demonstrated by Butenandt and Störmer (1932) when they showed that the benzoate of oestrone had a prolonged action. Oestradiol mono-

Removal of 'Elastoplast' Bandage

reduction product of androsterone, which is very insoluble in body fluids, no fewer than thirteen successive implantations of the same set of 6-mg. tablets were made into successive sets of castrated rats for ten-day periods. The total time of each tablet in the animals was thus 130 days—about four calendar months. At the end of this time the tablets were reduced almost to nothing, but the remaining material was still physiologically active. The total weight of accessory organs produced in these experiments was incomparably greater than can be obtained by the injection of 10 mg. of the hormone in oil solution.

Tablet administration has the obvious advantage that there is no necessary fluctuation in the amount of material absorbed, such as must result from even frequent injection. Once absorption has begun it will continue week after week, or even month after month with substances of suitable solubility, declining steadily as the tablet decreases in surface area, but free from minor irregularities. There is no obvious local reaction in experimental animals following the subcutaneous implantation of tablets of oestrone, testosterone, or testosterone propionate. The evidence that neither testosterone nor oestrone is inactivated by long incubation at body temperature in the subcutaneous fascia is conclusive, and it would seem that where very prolonged effects are required a clinical trial of the technique is warranted.

Progesterone

The effectiveness of progesterone does not seem to be so much altered by conditions of administration, though possibly this is because the rabbit, the usual test animal, seems to make more economical use of injected gonadal hormones than does the rat (Deanesly and Parkes, 1937). So far as our preliminary experiments show, tablet administration of progesterone gives no increase of response in short duration experiments as compared with daily injections, possibly because absorption is extremely slow, but it is already obvious that a very prolonged effect from a single administration could be obtained by the tablet technique. In view of the difficulty of esterifying progesterone the technique may be of practical value.

Other Substances

Problems of absorption are not peculiar to gonadal hormones. It is well known that the effectiveness of gonadotropic extracts is raised by increasing the subdivision of the dose. Addition of a precipitant such as zinc sulphate to the solution also greatly increases effectiveness, presumably by retarding absorption (Maxwell, 1934). Unfortunately their high water solubility and their lability in contact with water at body temperature make gonadotropic preparations unsuitable for tablet administration. The observations of Bates and Riddle (1936) on the influence of route of administration on the effectiveness of prolactin, and those of Ch'en and van Dyke (1936) on increasing the action of thyrotropic extracts by the addition of merthiolate, are also relevant.

There are a number of well-known examples of the same principles applying to other hormones, notably the work leading up to the production of protamine insulin. In general it may be said of many of the hormones concerned in producing chronic effects that purification and isolation make the active substance so readily absorbed by the animal that in practical use high effectiveness can only be obtained by frequent injections or by retarding absorption in one of the ways described above.

OTITIS EXTERNA: "HOT-WEATHER EAR"

AN INVESTIGATION OF 100 CASES AND A METHOD OF TREATMENT

BY

FLIGHT LIEUTENANT GEORGE MORLEY, F.R.C.S.

Royal Air Force, Aden

The scope of this contribution is limited to inflammation of the external auditory meatus apparently caused by hot humid climatic conditions and associated with an infection with *B. pyocyaneus* in pure culture. At the aural clinic of the Royal Air Force Hospital, Aden, a series of 100 cases was investigated, a line of treatment evolved on a simple practical basis, and search made for a common causative factor.

Occurrence

Infections of the external auditory meatus with *B. pyocyaneus* (*Pseudomonas pyocyanea*) among the troops in Egypt were described during the great war, and more recently have been reported from the Seychelles, Canton, Ascension, and East Africa (Hermitte, 1932), America (Greaves, 1936), and Australia (Bettington, 1934). Inflammations of the meatus are common in the troops generally,* and are often ascribed to a fungus infection. The conditions appear to be very similar and equally resistant to treatment, but as none of the cases which were bacteriologically examined in this series was found to have a fungus infection or any organism other than *B. pyocyaneus* and *Corynebacterium ceruminis diphtheriae*, no attempt is being made here to discuss any other infection.

It has not been possible to assess the incidence of the trouble in Aden. Many cases are treated as out-patients elsewhere than at the Royal Air Force Hospital, but all types seem to be affected, and it is by no means confined to the troops. A record of the monthly total of new cases was kept (see Chart), and it was noted that the majority were affected during the May-June and August-September

* This subject is dealt with in a joint discussion on the effect of aural conditions on fitness for active service, *Proc. roy. Soc. Med.*, 1937, 30, 1523.

benzoate behaves in much the same way. This prolongation of action is not seen if the compound is administered intravenously (Deanesly and Parkes, 1937), and it must therefore be due primarily to the esterification having decreased the solubility of the hormone in body fluids, and having thereby increased the time taken for absorption. Frequent injection is thus no longer necessary to achieve high efficiency with oestrogenic compounds.

A large number of esters of oestrone and oestradiol have been examined in a search for greater potency. David *et al.* (1935b) found that oestradiol diacetate has a more prolonged action than the free hormone, while oestradiol dibenzoate has a very prolonged action but requires a high minimal effective dose. Working with the feminization of plumage test, I (Parkes, 1937) found that oestrone acetate, oestradiol diacetate, oestradiol monobenzoate, oestrone benzoate, oestradiol-3-benzoate-17-acetate, and oestradiol dibenzoate showed increasing duration of action. Miescher, Scholz, and Tschopp (1937) have recently shown that a series of aliphatic esters of oestrone have durations of action proportional to the length of the acid chain. The higher esters, showing very prolonged action, have a high threshold dose. Deanesly and Parkes (1937) found that, so far as the plumage test is concerned, oestrone has the most prolonged action when administered by a single intramuscular implantation of a solid crystal of the free hormone. Given so, doses of 2 to 3 mg. continued to feminize plumage for about three months, a result far beyond those obtained with even the most effective esters in solution.

This body of facts makes it clear that it is not practicable to assay an ester in terms of the free hormone, since the result will depend entirely on the comparative test methods. In view of this fact, and of the increasing use of oestrone benzoate and oestradiol monobenzoate for clinical and experimental purposes, the second International Conference on the Standardization of Sex Hormones, held in 1935, established a preparation of oestradiol benzoate as an international standard for benzoylated preparations. The unit was again defined as the specific activity contained in 0.0001 mg. of the standard, but it was expressly stated that no equivalence of biological activity with the unit of free hormone was implied. The relation between 1 I.U. (international unit of free hormone) and 1 I.B.U. (international benzoate unit), whether clinically or experimentally determined, must depend on the method of administration and the test object employed, and can have no general significance. Further, it is doubtful whether it is practicable to standardize one ester in terms of another. As the number of market preparations of oestrone and oestradiol and their esters is likely to increase, and it is obviously impracticable to set up standards for every oestrogenic compound, it is highly desirable that the recommendation of the 1935 Conference should be followed by manufacturers, and that the precise nature and amount of the substance present should be marked on each ampoule. Only thus can the clinician have adequate data upon which to base an opinion as to the relative merits for clinical use of the various compounds available.

Male Hormones

Many of the facts described above for the oestrogenic substances apply with equal force to the various male hormone compounds. The first crystalline substance with androgenic activity was obtained from men's urine by Butenandt (1931). This had a fair activity on the capon comb but a low activity on rats, and it was noted by

Freud (1933) that, in relation to the activity on capons, the capacity of urine extracts to stimulate the accessory glands of the castrated rat decreased as the extracts were purified. A similar odd phenomenon was observed in the case of testis extracts. In comparison with androsterone or urine extracts, testis extracts were highly active on rats in relation to their activity on capons. When testosterone was isolated from testes it was found, as ordinarily injected in concentrated oil solution, to be less effective on rats than had been expected. David *et al.* (1935a) showed that recombination of the pure testosterone with discarded inert fractions of the testis extract led to greatly enhanced activity of the testosterone. Subsequently Miescher and his co-workers (1936a) showed that addition of any one of a large number of fatty acids to the testosterone solution led to the same effect, while Deanesly and Parkes (1936) found that increase of the volume of oily medium led to increased effectiveness of both androsterone and testosterone. It seemed clear, therefore, that the loss of effectiveness on rats of purified urine extracts, and the unexpectedly low effectiveness of crystalline testis hormone in concentrated oil solution, were caused by too rapid absorption from the site of injection, and that absorption could be delayed and the hormone made more effective by the re-addition of discarded fractions or fatty acids, or by increasing the volume of oil used for injection. The disturbance of the ratio of activity on capons to that on rats was due to the fact that effectiveness on capons is much less influenced by the presence of inert substances than is effectiveness on rats.

By analogy with the oestrogenic substances it seemed likely that a useful advance in the technique of administration might be made by esterification of the hormone. Miescher and his co-workers (1936b) made a series of aliphatic esters which showed an increasing duration of effect with increasing length of the acid chain. They were able to choose testosterone propionate as having the optimum combination of intensity and duration of activity. This compound, as examined by Parkes (1936), was more effective when a certain dose was given as two injections over ten days than when a corresponding amount of the free hormone was given as twenty injections over ten days. Since daily injection may be highly inconvenient for the clinician, testosterone propionate would seem to be a very suitable preparation in cases where male hormone therapy is indicated. Testosterone propionate, like oestradiol benzoate, shows no prolongation of effect if administered by intraperitoneal or intravenous injection, which ensures rapid or instantaneous entry into the circulation (Deanesly and Parkes, 1937), and it is evident that, as with the oestrogenic ester, the prolonged action is due primarily to slow absorption from the site of subcutaneous injection. Significant experiments are recorded by Deanesly and Parkes, who have shown that the effectiveness of free testosterone is greatly increased when it is administered by a single subcutaneous implantation of a compressed tablet of pure dry hormone. Under these conditions free testosterone becomes as effective as the propionate in oil solution. The propionate also shows a greater duration of action when given in tablet form. Even a small tablet of testosterone is only partly absorbed by the castrated rat in the course of a ten-day experiment, though great development of the atrophic accessory organs takes place during this time. The tablet can be recovered from the subcutaneous fascia and reweighed, and the dose absorbed by the rat calculated. The residual tablet can then be used for implantation a second time. With free testosterone this process has been repeated three times with a 2-mg. tablet. With androstenediol, a highly active

becoming acute. The complaint is of an aching ear, often associated with discharge from the meatus, which causes a yellow stain on the pillow-slip overnight. Slight adenitis may be present, and the auricle is tender on movement but not acutely painful. Hearing is only slightly diminished, but most distressing symptoms are caused in the hot humid atmosphere, and sleep is lost at night. Concentration at work is very difficult, and the condition may well be described as extremely aggravating. On examination the meatal walls are considerably swollen and "soggy," with plaques of white cheesy debris partly adherent and partly lying in the lumen. The tympanum can usually be seen through a narrow space and is generally normal. One very characteristic pitfall is a curtain of debris immediately lateral to the tympanum, usually incomplete, which very closely resembles a perforated tympanum with acute meningitis, the whole being bathed in purulent exudate. It is only when this has been removed that a normal tympanum is found to exist, and the differentiation of these conditions is largely a matter of familiarity with the appearances on auriscopy. For this reason the bright magnified view obtainable with an electric auriscope makes this the most useful method of examination. Removal of the sodden debris leaves excoriations which bleed very readily, and the ear then becomes more painful. Only those pieces which appear already detached can be removed without causing further trauma. There is in addition a thick purulent exudate, which lines the meatus and is very tenacious and difficult to remove efficiently. Most particularly is this true of the antero-inferior recess of the meatus immediately lateral to the tympanum. In long-standing cases this pus has been observed to assume a yellowish-green coloration with great regularity.

3. *Chronic*.—In this stage without treatment the condition in unfavourable circumstances readily relapses into the subacute phase. With treatment, however, and efficient careful removal of debris, the meatus assumes a slightly thickened red appearance, while scaly flakes of dead epithelium form on the walls. The tympanum is normal, but there is most frequently a sodden "subacute" area in the recess medial to the elevated floor of the meatus which is extremely difficult to eradicate. The chief symptom of this stage is most profound and distressing irritation, whilst the condition is aggravated by the rubbing and shaking of the auricle which this irritation provokes. There is a variable amount of discharge, which is of very thick greenish-yellow pus. Hearing is almost normal.

4. *Relapsing*.—In this stage the ear is to all intents and purposes normal both to the patient and on inspection. For a week or two after the chronic stage has been cleared after-treatment is necessary, as under very humid conditions the ear sometimes "feels wet again." If this is ignored recurrence is likely. In some cases this feeling persists during the hot season, and more acute symptoms can then be precipitated by the injudicious use of glycerinated ear-drops and wool plugs in the meatus (see below), designed to keep out irritating particles of foreign materials such as sand and dust. Cases under this heading are regarded as potential infections and are given prophylactic advice and treatment.

Bacteriology

Meatal swabs were taken from thirteen typical cases in varying stages. The reports upon each were of Gram-negative, non-sporing, motile bacilli with no evidence of fungus. Eight produced pyocyanine on culture and gave the sugar reactions of *B. pyocyaneus*. All contained

Corynebacterium ceruminis diphtheriae. A typical report of one of these cases in detail was:

A greenish-yellow pus, almost cheesy in consistency. Direct smear and hanging drop: numerous squamous epithelial cells. Actively motile coliform bacilli in large numbers, which were isolated in pure culture.

Characteristics of Gram-negative bacillus isolated:—Motility: + + +. Agar: Moist grey spreading growth. MacConkey: Moist grey spreading growth. Fluid MacConkey: No change. Glucose: Acid only. Lactose, saccharose, mannite, maltose, dulcitol: Minute bubbles of gas with no acid change, using Andrade's indicator. Peptone: No indole formed in five days; filmy grey pellicle. Litmus milk: Digested in twenty-four hours; no clot formation; greenish tinge developing to an intense blue-green by the fifth day. Glucose broth: Brownish wrinkled pellicle. Voges-Proskauer reaction negative.

Conclusions: The organism appears to be a true *B. pyocyaneus* in which, perhaps owing to oxygenation in the external ear, pyocyanthrose, a yellow pigment, is in excess of pyocyanine.

In many cases there was intense blue pigment production in most of the above media. Of the five remaining cases in which the full sugar reactions were not examined the reports were:

Actively motile, Gram-negative bacillus, giving the following reactions:—Glucose: Acid. Lactose: No change. Mannite: No change. Litmus milk: Slight acidity.

The cases which were examined were selected at random, and presented lesions typical of the condition. It has already been pointed out that the pigmentation of the pus in the later stages and the definite yellow staining of the pillow-slips due to discharge from the meatus are fairly well-marked clinical signs.

Treatment

In standardizing treatment cases were classified into the clinical groups described, and the routine was strictly followed according to the group.

ACUTE CASES

These cases, consisting of those with "boil" formation or obstructed meatus with excessive tenderness, were most frequently admitted into hospital, where treatment could be more intense, especially if pyrexia was present. With this group no effort was made to clean out the meatus; to attempt it is sheer brutality, as the pain is exquisite. The meatus is very gently syringed with boric lotion, as hot as the patient will tolerate. After this the meatus is allowed to drain by posture for a few minutes. The ear is next filled with warm 1 per cent. carboglycerin drops and a hot boric foment is applied, large enough to include the pre- and post-auricular glands. This treatment is carried out four-hourly, and is combined with initial purging by 4 grains of calomel in split dosage followed by salts. At first there was considerable diffidence in syringing with really hot lotion, lest vestibular disturbances should be caused. However, this does not appear to occur in these cases; most probably because the lotion does not freely reach the depths of the meatus. The relief is great and almost immediate, whilst the removal of small portions of debris makes the application of the carboglycerin more effective. The latter has been used only in 1 per cent. solution, and as such the analgesic effect has proved satisfactory when combined with the hot syringing and fomentation. The question of incision in these cases is interesting. In some earlier cases the pain was so acute that the meatus was examined under an anaesthetic. Sodium evipan was used, but no actual

periods, more particularly the former. At these times—the beginning and the end of the south-west monsoon—the temperature and the relative humidity increase, and there is scarcely any appreciable "cooling off" during the night. "Prickly heat" is also very common at this

Chart showing in graphic form the new cases of otitis externa occurring monthly.

period; both conditions, however, improve under the fresher weather during July and August, and during the cool season they almost entirely disappear.

Aetiology

It has been thought desirable to investigate two popular theories—that of causation by bathing, and that of irritation by sand or interference. Of the 100 cases only forty-six had bathed in the sea within approximately one month previous to the onset of symptoms. Of these, thirty-five were regular bathers, the remainder taking only an occasional swim. Twenty-one used wool plugs in the ears while bathing, and twelve admitted to cleaning the ears with wool wound on match-sticks after bathing. The average number of bathes per week among the regular swimmers was 2.85. Figures were unfortunately not available for the total number of bathers at various times throughout the year, but as a matter of observation it is certain that there is no marked increase during the hot periods.

There are only one or two small private bathing pools of fresh water in Aden, so practically all bathing is in the sea. While it is admitted that the number of cases is small for the purpose of forming a definite judgment, these figures appear to discredit the sea-bathing theory. Fresh-water shower-baths were taken, on an average of two a day, by ninety-five of the patients, and ordinary slipper-baths by forty. The water used for this purpose is supplied from deep artesian wells and is also used for drinking. It is analysed regularly at the Royal Air Force Laboratory, and no evidence of faecal contamination has been evinced. Only twenty-five of the patients could fairly be considered to have been more exposed than other residents to sand in Aden, where the amount is not great: one or two minor sand-storms may occur in July, August, or September. It was observed that a few individuals had served for some years in India or Iraq and had been unaffected by real sand-storms, while at a time when personnel were encamped locally in bad drift sand the incidence of the condition did not increase. None of the cases had any gross disease of the ear, nose, or throat on examination, other than the meatitis.

The origin of the organism is still in doubt. Faecal contamination has been suspected, but there is hardly any water-borne sanitation in Aden at present, and, as has been noted, there is no evidence of a contaminated water

supply. It is, however, a fairly ubiquitous organism, and it appears that certain factors promote its growth and render it pathogenic. No suggestion can be given as to the reason why *B. pyocyaneus* in particular should be the infecting organism. It is believed that the chief of these factors are moisture and maceration of the epithelium, especially if devitalized by trauma. It is well known that these cases present a moist appearance clinically, and that the corollary in treatment is to keep the ear dry. Also it is shown that most cases are infected when the humidity of the climate is greatest.

As a ship surgeon, outward bound, I first met the condition in the Red Sea and to a lesser extent in the Java Sea, while cases improved in the cooler climates. This view has been confirmed by naval and ship surgeons passing through Aden, who also note that it is more common among stokers, some of whom report for treatment automatically, as the result of past experience in the tropics, when they arrive in the Red Sea. There is no evidence that all these cases are associated with *B. pyocyaneus* infection. For these reasons the term "hot-weather ear" has been maintained—a term used by Lieut.-Colonel Palmer, R.A.M.C., when he described it as a clinical entity (Palmer, 1934)—because this appears to be the strongest aetiological factor.

Clinical Aspects

Otitis externa has been described as clinically divided into two categories—the dry and the moist. This division has not appeared to be at all satisfactory, and for the purpose of description and treatment it has been found desirable to enlarge upon it. The classification adopted here is as follows: (1) acute; (2) subacute; (3) chronic; and (4) relapsing. The first two conditions and usually also the third are "moist," whilst the fourth is "dry." There is, however, considerable overlapping between these classes.

1. *Acute*.—The patient usually complains of acute pain in the ear, often of a throbbing character, that has developed after a variable period during which he will have noticed increasing discomfort and usually some discharge from the ear. Pyrexia of 101° to 103° F. and pre- and post-auricular lymphadenitis often occur. Occasionally there is a slight degree of trismus, and mastication is painful. On examination the auricle may be slightly oedematous, and any movement of it becomes acutely painful. The meatus is occluded by swelling of the epithelial walls, which appear white and sodden, and a white curdy covering is often observed externally. The tympanum is not visible by ordinary auroscopic examination, and there is moderate diminution of hearing. If the meatus is examined under an anaesthetic the inner part is seen to be covered with sodden white epithelial debris, removal of which shows an inflamed, red, and very angry-looking meatus; but only rarely is there a definite boil to be seen. The tympanum is usually only affected to a slight degree; the normal light reflex is diminished, and the external surface is most frequently granular in appearance. Sometimes there is moderate injection in the region of the malleus, but never any bulging or pulsation. In most cases the tympanum is normal and mobile. As the condition progresses under treatment there comes a point of relief from the acute symptoms which is sometimes associated with the liberation of thin sero-purulent fluid and resolution of the acute phase temporarily. Observation and incision have failed to locate definite pus during this stage.

2. *Subacute*.—The majority of cases are first seen in this stage, and a large number can be prevented from

the meatus with hydrogen peroxide, then drying with ether, and applying a solution of silver nitrate in spiritus aetheris nitrosi was tried. Then spirit and biniodide of mercury, 1 in 4,000, was substituted for the ether. Argylol (2 per cent.), mercurochrome (1 per cent.), and liquid iodex packs were given exhaustive trials, with disappointing results. Zinc ionization promised well: a course of five treatments each of 1/2 mA for one-half hour, a stronger current being uncomfortable, produced good results at first, but recurrences were numerous. Vaccine therapy was not tried, although recommended by some observers (Hermitte, 1932), because it was felt that a simpler and more practical method of treatment could be evolved which could be practised efficiently at out-stations. Phenyl mercuric nitrate (Greaves, 1936) was not used in this series.

Finally one case arose in which all efforts to obtain a cure appeared futile: the condition just continued to relapse. First one side would improve and the other commence to discharge, then the state would reverse. This man spent fifty-seven days in hospital, in addition to receiving 107 days of out-patient treatment. The organism was a typical *B. pyocyaneus*, and all the methods of treatment described were tried with no avail. In the end the meatuses were treated with boro-iodine powder on the lines now described, and after one application on each side the condition cleared up completely. He has since passed through the whole hot season without recurrence, and only occasionally applies a few boro-spirit drops at night-time. The routine treatment was then evolved and adopted, with results which have been very satisfying, although not always as spectacular as in this one case.

Results

Since the treatment described was adopted as a routine and applied to the later sixty-six of this series of cases the average number of daily attendances has been 8.27 per case (maximum, 24; minimum, 2). Previously, under the other forms of treatment, this was considerably greater, and in the earlier thirty-four cases of this series the average was 22.6, or, excluding the exceptional case to which reference has been made, 18.1, with a maximum of 72 and a minimum of 3. Admissions to hospital have totalled five from the earlier thirty-four cases (16.6 per cent.) and three from the sixty-six later cases (4.54 per cent.)

Published results of vaccine therapy are good after periods of weekly injections extending over some five or six weeks (maximum, 12; minimum, 3). The vaccines used were autogenous, but the suggestion is made that a stock vaccine might prove equally efficacious (Hermitte, 1932).

Phenyl mercuric nitrate, used 1 in 1,250 in 95 per cent. alcohol, is claimed to have a spectacular effect on the acute stage and to shorten the course and hasten recovery in the chronic and long-standing cases (Greaves, 1936).

Summary

1. A series of 100 cases of otitis externa occurring chiefly during the hot humid seasons of Aden was investigated, and a representative number of cases were found to be infected with *B. pyocyaneus* in pure culture.

2. The influence of sea-bathing and a sandy atmosphere as aetiological factors is discussed and discredited; whilst the seasonal incidence is held to justify the term "hot-weather ear."

3. A routine method of treatment with facility of application is described, based upon boro-iodine therapy. The use of cotton-wool plugs in the meatus is discouraged. Prophylaxis and after-treatment are described.

4. The results of this form of treatment as applied to sixty-six cases are given, and are compared as far as possible with those of some recently published methods.

I wish to acknowledge my indebtedness to Squadron Leader Lee-Potter, M.D., for having carried out the bacteriological investigations; also to the officer commanding the Royal Air Force Hospital, Aden, for his encouragement, and for permission to prepare this paper. The provision overseas of references and photostatic copies of publications by the librarian of the Royal Society of Medicine has been greatly appreciated.

E. T. Ceder and L. Zon (*Publ. Hlth. Rep.*, Wash., November 5, 1937, p. 1580) issue a preliminary report on the treatment of psoriasis with massive doses of crystalline vitamin D and irradiated ergosterol. They point out the frequency of psoriasis, its tendency to occur in the winter, and its diminished prevalence in summer and in the Tropics. The benefit derived from ultra-violet irradiation combined with the application of coal tar is possibly due to the production of a substance similar to irradiated ergosterol. This substance may have toxic effects or produce deleterious effects in children, in rats, and in those who have a recently calcified tuberculous focus. Massive doses of vitamin D, 300,000 units daily, given for chronic arthritis, produced involution of the associated psoriasis. Fifteen established cases of psoriasis were treated with similar doses of vitamin D in sesame oil, given after meals by the mouth. Two brands were used: one produced involution in ten out of twelve and the other one out of three cases in six to twelve weeks. No other treatment was given. All the patients but one developed a progressive hypercalcaemia. Six out of ten in one group gradually relapsed in one and a half to five months. The benefit given may be due to any of the components of irradiated ergosterol, and if it is to be continued necessitates a small maintenance dose.

boil could be found. Once or twice the most turgid and inflamed region was incised without the liberation of definite pus. Despite the relief this procedure gives it is considered that incision is contraindicated. Even if a definite boil is seen, which is unusual, it seems better to allow it to burst under the conservative treatment described; the pain is relieved speedily by both methods, and convalescence is not hastened by incision. Except for these early cases no occasion to incise the meatus has arisen during the last two years.

SUBACUTE CASES

These are cases in which there is partial occlusion of the meatus that is sufficiently painless to permit the introduction of instruments. In this group the object of treatment is to tide over and shorten the gap between acute occlusion and the relative patency of the chronic infection. The meatus is gently cleaned by direct application of dry sterile cotton-wool on malleable wool-carriers, under direct vision with reflected light. The electric auriscope is used only for inspection in this stage. When moderately clear of debris the meatus is packed firmly, but not tightly, with sterile half-inch ribbon gauze soaked in 1 per cent. carboglycerin, being retained in position by an external wool plug. This procedure is repeated every twenty-four hours. The steady light pressure lessens the swelling, the glycerin loosens the dead epithelium, and the carbolic acts as a mild antiseptic and analgesic. This stage as a rule lasts only two or three days and leaves a clean but inflamed meatus, while debris persists in the recess near the drumhead.

CHRONIC CASES

This group comprises cases in which the condition has been present for some time; those recovering from an acute attack; and those in which the meatus is patent, pus is formed, and epithelial maceration is the rule. In this stage, in which the greatest difficulty has been experienced in ensuring successful and speedy recovery, various forms of treatment were tried and the basic principles of dryness and thoroughness were soon confirmed. Both present difficulties: the dry infected meatus produced the most aggravating irritation and distress to the patient, whilst excessive zeal in removing every piece of debris caused excoriations very easily and rendered the ear sore and difficult to treat.

The routine finally adopted has been as follows. First the ear is cleared of obvious gross debris: a day or two on the treatment described for subacute cases has been found most successful for this purpose. The meatus is then dried with either ether or boric and spirit drops. After mopping with dry sterile wool the patient inclines his head right over, to bring the affected ear uppermost, and is warned to keep his eyes tightly closed. A small quantity of boro-iodine powder is tapped well into the meatus and insufflated with a Siegle's speculum into all parts of the meatus. Care is taken to avoid blowing the powder into the operator's eyes. The meatus is then quickly packed with the powder until it is full, the whole being lightly tamped home. Without delay the meatus is now plugged with a firm pledget of wool.

The dressing is left undisturbed for forty-eight hours. It causes slight discomfort for the first hour or two, but in no case has this been intolerable. At the conclusion of this period the ear is very gently syringed to clear away the remains of the powder, the greater quantity of which has usually been dissolved, and the meatus is filled with boro-spirit drops for a few moments, after-

wards being drained by posture. It is sometimes necessary to detach dried pieces of dead epithelium with forceps, and occasionally small casts of the meatus are removed in this way; otherwise the use of instruments is avoided at this stage, and the meatus is not kept plugged with wool. Boro-spirit drops are applied twice daily for two days, and the treatment is repeated if it is then found necessary. As a rule only two such applications of boro-iodine powder have been indicated, although repetition has occasionally been necessary after about ten days.

Essential points are the drying of the meatus, speed in the application of the boro-iodine powder as the iodine evaporates rapidly in hot climates, and the subsequent avoidance of any form of plug in the meatus. The reason for the last-named is that the cartilaginous portion of the meatus contains sweat glands (Powell, 1934), and any plugging distal to these must cause increased humidity in the meatus and maceration of the epithelium, conditions which predispose to recurrence. With the use of only a thin film of powder it has been found that the iodine evaporates so quickly in a climate such as that of Aden that the filling of the meatus as described is regarded as essential. In no case has this caused any trouble: within a few hours the powder appears to be dissolved by the moisture of the plugged meatus.

After-treatment

Most cases are now discharged from the clinic with a bottle of boro-spirit drops, a small quantity of which they are advised to insert into the meatus last thing at night. Patients are instructed to dry the ears carefully after bathing, especially after taking a shower-bath, by gentle shaking with a towel inserted in the auricle on the tip of the little finger and with the head inclined over on the side. The insertion of wool plugs is strongly discouraged for the reasons mentioned above, although the question of using "a plug of cotton-wool soaked in olive oil during bathing" frequently arises. Unsterile oil and dirty wool are often used, and the plug is sometimes forgotten. It is of doubtful efficiency, and is needless if the ear is carefully dried.

Preparation of Boro-iodine Powder

The method described by Scott Stevenson was taken as a guide (Scott Stevenson, 1935) and modified to suit the climate of Aden. The following description has been prepared by the dispenser at the Royal Air Force Hospital, Aden:

"For the preparation of iodized boric powder sublimed iodine is used in a strength of 1 per cent. in acid. boric. pulv.; the iodine is first broken down with a few drops of alcohol 90 per cent. The boric acid is added in powder form in small quantities as quickly as possible, using a non-porous glass mortar and keeping the mixture moving all the time. As soon as the iodine appears to be evenly distributed the powder is transferred to a wide-mouthed dark glass-stoppered bottle, without waiting for complete drying. Evaporation of the iodine is very rapid; if any delay occurs all the iodine is lost, and the use of a glass-stoppered bottle instead of cork is necessary to preserve the iodine content."

Other Methods of Treatment

In many papers dealing with this and allied conditions there appear a variety of treatments, a number of which have been tried here in the hope of finding one more satisfactory than the others. At first diligent mopping of

and the tongue may then be bitten, and frothing at the mouth sometimes occurs. In the moderately severe cases tetanic spasms may appear in the extremities, but by no means always, and temporary hysterical paralyses are occasionally seen. Throughout the whole of the attack, whatever the severity, rapid and sometimes stertorous respiration continues and eventually subsides spontaneously; the fit then ceases. If left alone the patient remains drowsy and may suffer from headache for some hours afterwards. Sometimes a succession of fits will continue for two to three hours on end, always accompanied throughout by hyperventilation, which increases before each fit. Though attacks subside with a spontaneous reduction of the rate and depth of breathing, they can also be stopped artificially in one of three ways: (1) by closing the patient's nose and mouth and so controlling the rate of respiration; (2) by putting on a rebreather bag; (3) by intravenous injections of calcium chloride, 10 c.cm. of a 5 per cent. solution. Injections of saline given on several occasions to exclude suggestive effects of intravenous therapy were found to be ineffective in stopping a fit.

All these phenomena can generally be reproduced by a short period of voluntary hyperventilation, after which the respiration will suddenly jump into its own tempo and the other accompaniments of the attack follow automatically, as in the spontaneous ones. Though the severity of these induced attacks is rarely as great as with those coming on spontaneously, the two forms are similar in all respects.

Illustrative Cases

The following cases illustrate varying degrees of severity in the type of attack described above.

CASE I

This patient, a girl aged 18, had had hysterical "fits" for the past four months. She was described as being nervous and highly strung as a child, and for many years had been subject to fits of temper and unable to travel much alone. She always had to be taken to and from her work, where her record was unsatisfactory, with frequent illnesses and changes of occupation. The first fit occurred at work, when she collapsed into a semi-conscious state for about an hour; the fits recurred frequently from then on till the time of admission—a succession of attacks sometimes, lasting up to five hours. On admission she had a fit in the waiting-room and again soon after her arrival in the ward. There were further attacks in the presence of new doctors or when she was upset by ward routine. The attacks were described by her as commencing with a feeling of suffocation in the chest and tight feelings in the body; overbreathing then commenced, and the fit would start about sixty seconds later. She lapsed into a semi-conscious state with stertorous respiration, and lay tossing about on the bed without actual tetany of the hands. The fits would continue for an hour or more if she was left undisturbed, but they could always be stopped by an observer—by regulating the respiration or by injecting calcium. Fits of less severity, without loss of consciousness, could be induced by making her overbreathe for two minutes or more. Severe attacks followed the injection of adrenaline, which produced anxiety feelings: tetany would sometimes occur in these adrenaline-induced attacks. The fits gradually became less frequent, following explanation of the mechanism and the immediate stoppage of each fit as soon as it began. The patient was finally discharged—having been free of them for three weeks—to attend the out-patient department, and has not had any symptoms for two months. The ultimate prognosis was not considered good, as the patient had a bad previous personality and denied all overbreathing; it was considered probable that she would use this mechanism again when in difficulties.

CASE II

This patient, an unmarried woman aged 28, was admitted complaining of severe loss of weight and energy, vomiting, paraplegia, headache, irritability, frequent crying, and "fits." A diagnosis of hysteria was made. The history showed that she had always been shy and apprehensive, and the "delicate" spoilt child of the family. At 19 she won a scholarship to an art school, where she spent seven years and led a rather "wild" life, as opposed to her strict religious upbringing. This finally culminated in an entanglement with a married man.

The fits began soon after she went to the art school, occurring in difficult situations. In these she felt a tightness in the chest with a feeling of suffocation, which was followed by overbreathing. Her legs then "gave way" and she collapsed, with tingling, numbness, and tightness in the hands and feet, and giddiness. These attacks became more severe following the affair with the married man. A year before admission she lost control of her legs after a particularly severe fit and developed the other hysterical symptoms shown on admission. It was observed that the fits could be induced after three minutes' overbreathing and stopped by the usual methods. After explanation the patient found that she could prevent threatened attacks by inhibiting the overbreathing. After six months' treatment in the hospital she was discharged to satisfactory and interesting work, and has been free of all symptoms for nine months.

CASE III

A man aged 39 was admitted complaining of "fits" on and off for twenty years, during most of which time he had been in employment. The first fit occurred in a war hospital during a bout of coughing induced to maintain a pretence of bronchitis. Since then they had occurred off and on when he was run down. The fits commenced with cramp in the right abdomen associated with a feeling of suffocation. Overbreathing then followed, and soon resulted in a bursting feeling in the head and numbness in the body, and in fainting. At this stage he was convulsed with violent struggling movements which often took three nurses to control, and he was unresponsive to painful stimuli. Tetanic spasm of the hands and feet was not present. The fits usually lasted half an hour to an hour, but could be readily stopped at any stage by applying a rebreather bag. For three to four hours after a fit he was listless and suffered from a headache. During a short spell of in-patient treatment he was able to reduce the frequency of his fits considerably, but could not completely overcome this long-ingrained emotional reaction.

Diagnosis

Before the attack is actually observed the diagnosis is suggested by obtaining the history of the characteristic premonitory symptoms of tightness in the chest with feelings of suffocation, tingling in the extremities, and giddiness or other forms of disturbed consciousness. Many will deny that they hyperventilate during an attack, but when the overbreathing is actually seen the diagnosis is more obvious, and is finally confirmed by the cessation of the attack when the observer controls the patient's breathing or gives an intravenous injection of calcium. It is also usually possible to reproduce the phenomena by asking the patient to overbreathe voluntarily for several minutes, but some of them do not co-operate readily in this experiment.

True epilepsy can be distinguished by the general features of the fit, especially by the usual absence of the premonitory symptoms described above, the loss of the corneal reflex, the voiding of urine, the frequent occurrence of cyanosis, and the rarity of overbreathing throughout the fit. Hyperventilation fits must also be distinguished from other types of hysterical fit where an

HYPERVENTILATION ATTACKS

A MANIFESTATION IN HYSTERIA

BY

RUSSELL FRASER, M.B., M.R.C.P.

AND

WILLIAM SARGANT, M.B., M.R.C.P.

(From the Psychiatric Unit, Maudsley Hospital, London)

It is well known that overbreathing brings about tetany in certain susceptible subjects. Other somatic and psychological effects also result from hyperventilation, but these are apt to escape recognition in clinical practice. At the Maudsley Hospital and out-patient clinics during the last eighteen months over twenty patients were seen who had fits and fainting attacks with hyperventilation as a central feature. Since tetanoid spasms were not always present the part played by overbreathing in the production of the fits had generally been unrecognized.

Mechanism of the Condition

There have been many studies of spontaneous hyperventilation tetany (Goldman, 1922; McCance, 1932; Cumings and Carmichael, 1937; Fraser, 1937; and others). In most cases no pathology has been discovered for the condition, but it has sometimes been found in association with encephalitis lethargica (Barker, 1922; Harrop, 1923) and spontaneous hypoglycaemia (Wilder, 1934). It has also been reported by Goldman (1922) as occurring with pain, nausea, acute infections, and excitement. Changes of mood appear to play a part in certain susceptible individuals. Guttman (1927), discussing the occurrence of tetany in hysterical subjects, thinks that it is a pre-formed mechanism released by overbreathing following or accompanying "Angst," since both of these features are generally seen to precede an attack. Noikin (1930), considering the causation of fits diagnosed as hystero-epilepsy and affect-epilepsy, concludes that one of the mechanisms in the production of the convulsive state is the overbreathing that occurs in these psychopathic individuals under emotional stress and appears to lead up to the fit. It is probable that at least some of his cases are severe manifestations of the type of attack we are about to describe, though we have included none in our series that had true epileptic fits.

Some of our patients' "fits" were typical of those usually described as spontaneous hyperventilation tetany, but many had been diagnosed as fainting or hysterical attacks of varying degrees of severity and did not show tetanic spasms. In all cases, however, hyperventilation occurred throughout the attack, and closer examination revealed other features in common, such as the previous personality and constitution of the patient, and the mode of onset and cessation of the attack. The varying types of attack could also be stopped artificially in the same way. Ample evidence was present for grouping them together and postulating a common mechanism, since the only real difference lay in the severity of the attack, the degree of loss of consciousness, and the varying nature of the motor phenomena met with in individual patients.

The main biochemical change so far demonstrated during the hyperventilation attacks has been a gaseous alkalosis resulting from the overbreathing (Collip and Backus, 1920; Fraser, 1937). The blood calcium alters little, with a slight tendency to rise (Popoviciu *et al.*, 1933; Scott and Cantor, 1933). As yet we are ignorant of the actual mechanisms responsible for the spontaneous onset

of the overbreathing and the increased susceptibility to its effects shown by these patients. These problems are still being investigated.

Practically all our patients were found to have the hysterical personality, so far as this can be clearly defined. They were generally suggestible and emotionally unstable people who easily became apprehensive. They depended on the sympathy and help of others, and showed little persistence in the face of difficulty. Certain constitutional peculiarities were also found in most of them, such as a tendency to brisk reflexes and autonomic irritability. Nearly all were females between the ages of 15 and 30, but one was aged 45. Only two were males.

The attacks were sometimes the sole complaint of the patient, but usually only one of many symptoms in a psychological illness. In a few cases they had been present for many years and occurred regularly with emotional excitement, but generally they were seen only during the acute stage of a depressive or hysterical illness, and disappeared with recovery. The history of the initial attack often revealed that its onset coincided with some particularly severe emotional disturbance. Following the first one, attacks tended to recur whenever the patient's emotions were again aroused. After several fits the susceptibility to them often increased, and some subjects could apparently induce them at will. One man, for instance, had had his first attack in a war hospital, where he had been admitted with the symptoms of bronchitis. A hyperventilation fit occurred one day when he was keeping up the pretence of bronchitis by frequent and exaggerated bouts of coughing. During the last twenty years this mechanism has been so often used by him that it has now become an automatic response to stress of any sort; and though he was able to reduce the frequency of the fits considerably while under treatment he has never entirely got rid of them.

Description of Attacks

Though occurring more readily while under observation of others, they may happen at any time of the day or night. The initial features are very characteristic, and include vague anxiety features such as sinking feelings in the stomach, palpitations, generalized flushings, and trembling. These are followed by a tightness in the chest, by feelings of suffocation and the need for more air, and sometimes by "cardiac" pain. At this stage the patients can generally arrest the attack by not "letting themselves go," but when this stage has passed the attack progresses to its completion unless arrested by an observer. Overbreathing starts when the feeling of suffocation is experienced, and other phenomena then follow in rapid succession. The attacks have three further features after this initial stage which precipitates hyperventilation: (1) interference with consciousness, of differing degree; (2) tingling in the extremities; (3) various types of motor phenomena. In the mildest forms there may be merely some tingling and numbness in the extremities accompanied by mild giddiness. In the severer forms there is a feeling of being "far away," or actual loss of consciousness, and the patients collapse on the floor and lie unresponsive to the usual painful stimuli. In our cases the corneal and light reflexes and control of the sphincters were retained and plantar responses were normal, though the conjunctival reflexes were sometimes lost. The motor phenomena seen are variable: some patients lie limp, but others wave their arms and struggle restlessly; only in some of the more severe cases do periods of tonic opisthotonos occur at the height of the motor restlessness,

and was made up in rubber-capped bottles in sterile form, its strength being 40 units per c.cm. The stability of the mixture was such that its strength remained undiminished for several weeks at room temperature. The mixture consisted of insulin and tannic acid in the proportion of 1 to 2, with the addition of zinc, 1 gramme to 500 units of insulin.

The nine diabetic patients were stabilized on diet with twice-daily doses of ordinary insulin before the start of the investigation. The diets consisted of four meals a day, timed as follows: breakfast, 7.30 a.m.; dinner, 12.15 p.m.; tea, 4.30 p.m.; supper, 7.30 p.m.

Doses of the insulins were given as follows:

1st day of test: ordinary insulin at 7 a.m. and 4 p.m.

2nd day: protamine insulin-zinc at 7 a.m. only.

3rd day: no insulin at 7 a.m., but ordinary insulin at 4 p.m.

4th day: insulin-tannic acid-zinc at 7 a.m. only

5th day: no insulin at 7 a.m.; ordinary insulin at 4 p.m., and resumption of usual routine.

The dose of insulin-tannic acid-zinc was the same as the dose of protamine insulin-zinc.

Blood sugars were estimated by the Folin and Wu method, and were examined as follows:

1st day (ordinary insulin): hourly from 7 a.m. until 6 p.m.

2nd day (protamine insulin-zinc): hourly from 7 a.m. until 6 p.m.

3rd day: at 7 a.m. and 8 a.m. only.

4th day (insulin-tannic acid-zinc): hourly from 7 a.m. until 6 p.m.

5th day: at 7 a.m. and 8 a.m. only.

Case 9 was examined hourly on the second and fourth days from 7 a.m. until 9 p.m. The routine of the third, fourth, and fifth days was repeated in Case 8 on a second occasion, so as to obtain blood-sugar readings from 6 p.m. until 9 p.m.

On the third and fifth days no insulin was given at 7 a.m., so as to examine the action of the previous dose, twenty-four hours after its injection. The conditions of experiment for the second and fourth days were made the same by giving the injection of ordinary insulin at 4 p.m. on the previous day in both cases.

The results are set out in Table I. Those for Case 9 are illustrated graphically in the chart, which is character-

audience is necessary and the manifestations of the attack are mainly an emotional display without overbreathing, which can be stopped by the patient at will.

Treatment

While the emergency treatment of the isolated attack is entirely along physical lines—restriction of the overbreathing by an outsider or the injection of calcium intravenously—nevertheless the prevention of further attacks almost always calls for the psychological adjustment of the patient. Also following an explanation of the mechanism, some patients can be persuaded to arrest the attack in the early stages by a conscious control of respiration. Others, however, deny that they consciously overbreathe or can control their respiration when they become over-anxious. Especially in those who have difficulty in arresting the attacks once the premonitory symptoms of anxiety have occurred, benefit frequently results from investigating the causes of their emotional upset: discussion of their maladjustments and steps taken to alter disturbing factors in their environment often bring about a rapid cessation of the attacks. We failed to persuade a few patients who were deliberately inducing fits to give up this useful refuge from their difficulties.

The giving of calcium, alkalis, or acids by the mouth did not diminish the rapid spontaneous onset of the attack. But the biochemical approach to treatment merits further investigation and offers an interesting subject for future research.

Conclusion

Our study of the above cases has suggested that many hysterical fainting attacks and fits have hyperventilation as a central mechanism. A wide variation is possible in the clinical features of the hyperventilation attacks in different patients, but they appear to fall within one syndrome. The individual variations seem to depend on the severity of the hyperventilation, the degree of autonomic dysfunction, and constitutional tendencies, both metabolic and neurological. Many problems remain as yet unsolved concerning the mechanism of this type of attack, but it is an interesting example of the way physiological abnormalities play a part in the production of apparently hysterical symptoms.

Summary

1. Over twenty cases have been collected in which fainting attacks or fits with hyperventilation were a central feature.
2. The attacks were generally precipitated by emotional disturbance in patients who showed personality and constitutional features suggesting hysteria.
3. The varying features of the attack are described.
4. Diagnosis and treatment are briefly discussed.

Our thanks are due to Professor Edward Mapother for permission to publish these cases.

INSULIN-TANNIC ACID-ZINC SUSPENSION IN TREATMENT OF DIABETES MELLITUS

BY

C. N. JENKINSON, M.Sc., M.D.

Biochemist, City General Hospital, Sheffield

AND

K. J. G. MILNE, M.D., D.P.H.

Resident Physician, City General Hospital, Sheffield

Much interest has been aroused during the last few years by the introduction into clinical practice of new preparations of insulin, such as protamine insulin ("insulin retard"), protamine insulin (with zinc) suspension, and zinc crystalline insulin. In use these preparations possess the characteristic features of delayed onset in action and prolongation of their maximum effect for several hours beyond that of ordinary insulin, phenomena which have been studied experimentally and clinically by previous workers (Bennett *et al.*, 1937). Suspensions of protamine insulin (with zinc) begin acting in nine to eleven hours, and achieve their maximum effect in fifteen to twenty hours. The value of these new insulins in the treatment of diabetes mellitus is now generally accepted, and has stimulated interest in the clinical potentialities of combinations of insulin with other organic substances and metallic salts. Among the substances studied in this connexion may be mentioned ferrous chloride, magnesium and other allied metals, lipoids, and—of special interest—tannic acid (Bischoff and Maxwell, 1935). The influence of tannic acid on the physiological action of insulin was first demonstrated by Bischoff (1936) during an investigation upon the precipitation of insulin by tannic acid. Insulin in combination with varying proportions of tannic acid, when injected parenterally into rabbits, produced delayed absorption of the insulin with a prolonged hypoglycaemic effect. Gray (1936) consequently gave to diabetic patients hypodermic injections of insulin-tannic acid mixtures (made immediately before use), and noted a delayed but prolonged action of insulin. He also observed that in certain patients erythema and subcutaneous swellings developed at the site of the injections. He did not, however, consider that the skin reactions were a significant drawback to the use of such mixtures. The action of the tannic acid-insulin in animals was further studied in this country by Bavin and Broom (1937), who confirmed the findings of Bischoff and further demonstrated that the properties of the mixtures were enhanced by the addition of zinc (*Lancet*, 1937, 2, 390).

It is the purpose of this communication to report upon a clinical trial of the Bavin and Broom preparation, with reference to the changes produced in the blood-sugar levels and the local results of subcutaneous injections.

The Effect on Blood-sugar Levels

The blood-sugar levels of nine selected diabetic patients were examined during three periods, in which the patients received exactly the same diet, given at the same times, but with hypodermic injections of different types of insulin. The first test was carried out after injection of ordinary insulin. This was followed by observations after injections of protamine insulin-zinc. Finally the routine was repeated after a dose of insulin-tannic acid-zinc. The latter was a stable light-brown suspension containing the insulin, tannic acid, and zinc already mixed,

TREATMENT OF FRACTURES OF THE PATELLA BY EXCISION

BY

G. O. TIPPETT, F.R.C.S.

Assistant, Orthopaedic Department, Croydon General Hospital, the St. John Rheumatism Clinic, and the Arthritic Unit of the L.C.C.

The treatment of fractures of the patella has been the subject of experiment for many years. None of the methods previously advocated has been so radical or so contrary to accepted principles as that recently described by Brooke (1937)—namely, removal of the broken bone. It is my intention to comment further on this recent operation and to add some cases to the dozen recorded by Brooke in his original article. No doubt since the publication of that article, with a commentary by Mr. Hey Groves in the same number of the *British Journal of Surgery*, other cases have been operated upon on the same lines. I cannot, however, trace any further references or articles on the subject since that time (Tippett, 1937).

Indications for Removal of the Patella

Mr. Brooke advocates the removal of the patella for all cases of fracture of the bone. This would at first sight appear to be a rather radical procedure. The results seem to justify it, as he amply proves by the follow-up of his cases. I would classify the following as indications for excision.

DIRECT INDICATIONS

1. Comminuted fractures, both recent and old.
2. Compound fractures.
3. Post-operative complications of other operative procedures—namely, failure to correct alignment—with late arthritis, etc.
4. Congenitally displacing patellae.

INDIRECT INDICATIONS

Arthritis: (a) mechanical; (b) osteo-arthritis. Mechanical arthritis may follow on a wiring or other fixative operation for a fractured patella. The arthritis may be caused by the trauma which broke the bone—giving rise to a degenerative type—or it may be caused by friction between the fractured patella and the femoral condyle. This latter may occur where there has been a failure to obtain an even articular surface to the back of the bone—that is, a failure to secure correct apposition or to correct the tilting of either fragment before they were fixed. A reactionary arthritis may be set up by the presence of a foreign body such as wire in the tissues about the knee-joint.

Osteo-arthritis is often seen in its earliest stages as a degeneration, and subsequent erosion, of the articular surface on the back of the patella and the intercondylar space of the femur. Creaking may be felt if the patella is rocked sideways with the quadriceps muscle relaxed (Warren Crowe's sign). In advanced cases much of the pain and weakness of the joint can be shown to be due to the erosion and exostosis about the patella. Removal of the bone, and thus removal of one of these eroded surfaces, will bring great relief, and possibly may for the time help to stem the progress of the disease by allowing fresh movement again to take place in the crippled joint.

Case I

A transverse simple early fracture in a fitter aged 45. Whilst ascending the station stairs he missed his footing and slithered down several steps, jarring his knee-cap. He continued his journey and did a full day's work. The next day, his knee being swollen, he rested, but later returned to work. As at the end of a week it was still swollen he went to his own doctor, who sent him to hospital. He walked a mile to get there. On examination he had a slight limp; the knee was swollen, suggesting a haemarthrosis. Extension of the knee was full and was done with moderate power. He could flex it only to 60 degrees before tension stopped him. An x-ray film showed a comminuted fracture of the patella. Operation of excision of the patella was advised and was carried out on May 18, 1937. The technique used was that described later in this article, with subsequent physiotherapy.

After-result.—In five weeks: no synovitis; flexes 45 degrees; quadriceps, power fair—extends 180 degrees; no limp; at work; no more treatment in massage department. After seven weeks: flexes 110 degrees; extends 180 degrees; power very good. After four months: flexes 120 degrees; extends 180 degrees; power excellent. After seven months: flexes 150 degrees; works at anything; knee is reliable; he can run, and I consider power 100 per cent. The absence of the patella causes no uncomfortable feeling when kneeling.

COMMENT

One will note the only slight disability and loss of power, in spite of the degree of comminution. This shows that the main pull of the quadriceps can just as easily be transmitted through the two lateral expansions of the tendon. That fact has not hitherto been adequately realized. This degree of comminution, if the fracture had been treated on the orthodox lines of rest on a back splint, must surely have resulted in a roughened posterior surface to the bone, with an inevitable acceleration of osteo-arthritis.

Case II

This was a transverse fracture of complicated type in a plumber aged 36. In 1925 he was knocked down and sustained a fracture of his femur and possibly also of his patella. His knee was never quite the same after the long period of immobilization necessary. In 1937 he fell down, and this time a radiograph showed a transverse fracture of the patella. He was treated in an infirmary on a back splint. Before coming to hospital he had been having an increasing amount of pain and fluid in the knee-joint. An x-ray film showed non-union of the bone four months later, with much backward tilting of the lower fragment. He could flex his knee only 20 degrees, while extension, though full, was very painful and was accompanied by much creaking. The patient localized the pain to behind the patella, and as this was obviously due to friction between the patella and the femur removal of the former seemed advisable. This would no doubt relieve the pain, and at this stage might improve the range of the movement of the knee-joint. Operation was carried out on July 11, 1937.

After-result.—In fourteen days he could flex to 60 degrees, with fair power, and extend to 180 degrees. He walked with a stick. Physiotherapy was continued. (This was a compensation case.) After three months he flexes to 60 degrees, and extends to 180 with fair power; he has no pain now, and walks as much as he likes. After five months he flexes to 80 degrees, with 60 per cent. power, and extends to 180 degrees. The patient is very pleased; he is back at work, climbs ladders, and has no pain.

COMMENT

I do not myself regard this result as disappointing, as it was not definitely known when he first fractured the patella, but the joint when opened at the time of the

istic of all the curves obtained. The effect of insulin-tannic acid-zinc is shown in the table and chart to be

Chart showing blood-sugar curves from Case 9; comparing the effects of a single morning injection of insulin-tannic acid-zinc and protamine insulin-zinc with a morning and afternoon injection of ordinary insulin.

B = breakfast. D = dinner. T = tea. S = supper.

similar to that of protamine insulin-zinc in that the single morning dose influences the blood-sugar level throughout the day as effectively as the two doses of ordinary insulin (morning and afternoon). The delay in onset of the hypoglycaemic effect of both protamine and tannic acid mixtures is illustrated, and after twenty-four hours the blood-sugar level remains low. In comparison with the blood-sugar levels obtained after protamine insulin-zinc, those with tannic acid-zinc are on the whole lower and show definitely less fluctuation from the mean. Thus insulin-tannic acid-zinc can effectively replace protamine insulin-zinc in the treatment of diabetic patients. No hypoglycaemic reactions were observed with any of the insulins used.

Skin Reactions

The local effect of hypodermic injection of the insulin-tannic acid-zinc preparation was tried in forty-five patients, including the nine diabetics. After subcutaneous injection of a small dose (10 single units) the site of injection was examined at intervals of a quarter to half an hour, one and a half to two hours, twenty-four and forty-eight hours afterwards. The results are shown in Table II.

TABLE II

Skin Reactions	Time of Onset of Reaction after Injection			
	1-1/2 hour	1 1/2-2 hours	24 hours	48 hours
Diabetics :				
Positive	1	2	3	1
Negative	8	7	6	8
Non-diabetics :				
Positive	13	16	33	13
Negative	23	20	3	23
Total Reactions :				
Positive	14	18	36	14
Negative	31	27	9	31

"Positive reactions" include erythema, subcutaneous swelling, soreness, and stinging.

The reactions noted were erythema (red wheals from 1 to 4 cm. in diameter), hard tender swellings, stinging and soreness on moving the arm. Thus while soon after injection only fourteen out of forty-five patients showed

any local reaction, after twenty-four hours thirty-six out of forty-five gave evidence of skin irritation. Many stated that they first felt and noticed a reaction about six to eight hours after injection; others experienced the first effects even later (about eighteen to twenty hours after). A further series of hypodermic injections were made with another batch of the preparation on eleven patients, with exactly similar results. One patient was given insulin-tannic acid-zinc daily for about three weeks and showed no such skin reaction and made no complaint throughout the whole of this period.

Conclusion

The delayed but prolonged action of insulin-tannic acid-zinc renders its potential utility in the treatment of diabetic patients comparable to that of the protamine insulin. Thus insulin-tannic acid-zinc may be used successfully in place of protamine preparations in patients who show no cutaneous reactions. Tannic acid is cheap and readily available; thus the cost of the preparation should compare favourably with that of the protamine insulins, which are considerably more costly than ordinary insulin. An objection to the general introduction of insulin-tannic acid-zinc in the proportions used in the present investigation is, however, the occurrence of skin reactions in some patients. In practice it thus becomes essential to give a trial injection to ascertain the sensitivity of the patient before embarking on a course of treatment with the insulin-tannic acid-zinc. Further work on the desirability of altering the composition of the suspension used in the present trials would seem worth while with a view to finding formulae for mixtures less apt to irritate the skin.

Summary

The blood-sugar levels of stabilized diabetic patients were examined after hypodermic injection of insulin-tannic acid-zinc suspension and compared with the levels following the use of protamine insulin-zinc suspensions and ordinary insulin respectively.

A delayed but prolonged hypoglycaemic effect was observed, the potential clinical application of which, however, is offset by its liability to produce irritant skin reactions in some patients.

We are indebted to Mr. W. A. Broom of Boots Pure Drug Co. Ltd. for supplies of the insulin-tannic acid-zinc suspension, and to Professor E. J. Wayne, University of Sheffield, for the interest he has taken in this investigation. Our thanks are also due to Dr. J. Clark, medical superintendent of the City General Hospital, for his permission to use the clinical records.

W. Van Der Horst (*Nederl. Tijdschr. Geneesk.*, December 18, 1937) records the case of a man, aged 72, who had suffered from prostatic trouble with occasional acute retention for two years. The patient was in a very debilitated state, and refused operation. As no improvement took place after the administration of urinary antiseptics, a catheter was tied in for twenty days, and a male hormone preparation in the form of "neohombreol" in doses of 3 mg. daily was injected. After fourteen injections the catheter was removed, and after ten more injections micturition became normal and painless and general improvement took place. The prostate, though still enlarged, had shrunk to half the size it had been a month previously.

Reviews

ENCYCLOPAEDIA OF MEDICAL PRACTICE

The British Encyclopaedia of Medical Practice: including Medicine, Surgery, Obstetrics, Gynaecology, and other special subjects. Volume 6. Gonorrhoea to Hydrotherapy. Under the General Editorship of Sir Humphry Rolleston, Bt., G.C.V.O., K.C.B., M.D., D.Sc., D.C.L., LL.D. (Pp. 602; 7 plates, 89 figures, 35s. net.) London: Butterworth and Co., Ltd. 1937.

Of the sixth volume of this encyclopaedia, which deals with the subjects gonorrhoea to hydrotherapy, nearly one-third is taken up by a series of important articles on diseases of the heart. Various authors have contributed to a symposium on heart disease in its varied aspects. Drs. Evan Bedford and J. W. Brown deal with congenital heart disease, pointing out that foetal disease plays a relatively minor part in aetiology compared with developmental anomalies. They adopt the convenient clinical classification, introduced by Abbott and Dawson, into three groups: those without cyanosis in which there is no abnormal communication between systemic and pulmonary circuits; the potentially cyanotic in which such an abnormal communication exists through which the blood is shunted from left to right, cyanosis only occurring if the shunt is reversed by pulmonary embarrassment; and the cyanotic group in which there is permanent shunt of blood from right to left side of heart or in which cyanosis is due entirely to peripheral stasis. The constituent lesions of these groups give a very variable expectation of life, and in the article the individual lesions and defects are discussed in a practical manner. Dr. Reginald Miller deals with rheumatic heart disease in children, not only the clinical aspects of diagnosis and treatment but also the very important problem of prophylaxis among children in general and particularly in the rheumatic child. Established endocarditis is covered in general terms by Dr. A. G. Gibson, who discusses the so-called non-malignant forms, and by Dr. A. W. Falconer, who gives a neat description of the clinical picture, diagnosis, and treatment of bacterial endocarditis. The latter appears to be less common than just after the war, but the outlook is as serious and treatment still unsatisfactory. Diseases of the pericardium and myocardium have separate consideration: the former by Dr. Shirley Smith, who classifies pericardial diseases into acute, tuberculous, and chronic adhesive, and myocardial disease by Dr. A. G. Gibson. The adjectival use of pericardium and myocardium catches the eye in the heading of the sections; in the text the customary adjectives are adhered to. Dr. T. F. Cotton deals with mitral disease, Dr. Maurice Campbell with diseases of the aortic valve, and Dr. Parsons-Smith with those of the right side of the heart. This individualization leads to some overlap; it may be advisable, even necessary, in dealing with heart diseases systematically. Fortunately Dr. Miller, in his excellent article on rheumatic heart disease in children, and Dr. Crighton Bramwell on heart failure, do take a wider view of the subject, emphasizing in the one instance the lesion as a pancarditis, and in the other treatment by estimating, conserving, and improving the cardiac reserve. The articles on complaints associated with bleeding are of high quality. Haematemesis is dealt with by Professor Carmalt Jones, haemoptysis by Dr. Jenner Hoskin, haematuria by Dr. Gaskell, and haemophilia by Professor Davidson, while Dr. Letheby Tidy contributes the section on haemorrhagic diseases dependent usually on some unexplained tendency for spontaneous extravasation of blood

to take place into the skin and other tissues and from the mucous membranes. Sometimes this tendency is hereditary, sometimes due to environmental deficiency or an infection; in other instances its origin is unknown or primary. Practitioners confronted by such a type of case will find a perusal of this section most useful.

Flamboyant gout does not occur so often as it did; perhaps the community is more abstemious on the whole, certainly the occupational group has been lessened by improved hygiene. Dr. Buckley points to the constitutional factor as allowing a more ready disturbance of purine metabolism in some subjects. He would not allow general disorders to be regarded as gouty in the absence of raised blood uric acid. For treatment diet, hygiene, medicines, and spa treatment are dwelt on. Dr. M. B. Ray, in discussing hydrotherapy, gives a useful classification of the spas of Great Britain and Europe not only for gout but also for the diseases of the various systems. The principles of the external application of baths and use of mineral waters are dealt with. Dr. Cumberbatch describes the apparatus for application of radiant heat and its therapeutic uses. The infective complaints in this volume are capably dealt with by experts, gonorrhoea by Colonel L. W. Harrison, and ulcerative granuloma by Mr. R. V. Rajam. Professor H. R. Dew has succeeded in compressing into the space allotted a useful summary of the pathology and clinical aspects of hydatid disease. A readable and up-to-date account of lymphadenoma or Hodgkin's disease is offered by Dr. M. H. Gordon, Dr. A. E. Gow, and Sir Humphry Rolleston. A good deal of research has failed to determine the cause, though much misunderstanding has been cleared up. It is possibly a virus disease. Two useful and broadminded discussions of surgical subjects are contributed by Professor Grey Turner on hernia, and Mr. Norman Lake on injuries, infections, and deformities of the hand. The subjects on the nervous system comprised in this volume are headache and hydrocephalus by Dr. C. P. Symonds, hemiplegia by Dr. Blake Pritchard, hemiatrophy and hemihypertrophy by Dr. Denis Brinton, and hepato-lenticular degeneration by Drs. F. M. R. Walshe and J. G. Greenfield. Dr. Cockayne brings together very clearly and helpfully the facts of Mendelian inheritance in their application to human disease. So far it has not been possible to associate the constitutional inheritance with proneness to a particular disease.

This volume carries on the admirable characters which we have remarked in regard to those that have already appeared. The preparation is made with great care; in this volume we have noted typographical errors only on pages 36 and 201.

HENNING'S GASTROSCOPY

Textbook of Gastroscopy. By Norbert Henning. Translated by Harold W. Rodgers, F.R.C.S. (Pp. 86; 7 coloured plates, 27 figures, 7s. 6d. net.) London: Humphrey Milford, Oxford University Press, 1937.

Exploring the lining of the stomach by direct vision has been the aim of diagnosticians for many years. By means of the flexible gastroscope this can now be accomplished with comparatively little discomfort or risk to the patient, and the results so obtained are of considerable clinical value. Several good books on the subject of gastroscopy have been published, notably those of Schindler and Henning in Germany and Moutier in France. Henning has attracted a series of visitors from this country, who have learned the technique under his guidance, and one of these has translated Henning's book. Mr. Rodgers is to be congratulated on the excellence of the translation.

findings in other centres. Thus Crooks (1936) in a clinical study found that twenty-four of 100 children had evidence of infection of the maxillary antra. Skillern (1923) quotes various authors' post-mortem findings, which vary from 47 per cent. to 17 per cent., and give an average of 32.7 per cent.

The view that some patients develop a collection of fluid in the sinuses during the terminal period of a fatal illness, when resistance and normal ciliary action are poor, cannot be satisfactorily disproved in all cases, but the history and clinical course, in addition to the gross sepsis found at necropsy in the majority of these infants and children, is very strong evidence in favour of a pre-terminal infection. The incidence of the common cold and the frequency of respiratory infections in the patients who are brought to a children's hospital are high enough to support the view that a considerable number have an infection in the accessory nasal sinuses. The part which sinusitis has played as a cause of death in this group of children is difficult to assess, since it could have been the aetiological factor or an associated condition or the result of the condition which caused the death.

Summary

1. The incidence of sinusitis in 496 infants and children examined post mortem was 30.6 per cent.
2. The maxillary antra were observed to be more frequently involved than the ethmoid cells or the sphenoidal sinuses.
3. A high incidence of associated otitis media was found.
4. Infection of one or more of the sinuses or ears was present in 63.1 per cent. of these children.

Clinical Memoranda

Tetanus supervening on Middle-ear Disease

The following case seems to be sufficiently interesting to be placed on record.

CASE REPORT

An Indian clerk aged 28 had a history of chronic purulent discharge from his right ear since childhood. Twenty days before admission to hospital he introduced some "samundar jahag" into the meatus. (Samundar jahag is a native "drug," and usually consists of powdered cuttlefish bone, but when this is not available dried scum from streams is substituted. These medicines are sold in the bazaar under filthy conditions, but have a local reputation among the less-educated classes for the treatment of suppurative lesions.)

Three days before admission he had difficulty in opening his mouth, stiffness in the back, a feeling of tightness in the chest, and pain in the right ear. All these symptoms gradually became more severe, so he went to hospital. On arrival he complained of the above-mentioned symptoms with

stiffness of the legs and tightness of the abdomen in addition. The temperature was 98° F., the pulse 72, and respirations 20.

Trismus and risus sardonicus were present, and the patient lay in bed on his left side, with some arching of the back and retraction of the head, and was moaning quietly. He could speak with difficulty, and complained of tightness of and pains in most of his muscles, and salivation. Spasms occurred on slight irritation. His eyes had a tendency to look to the right, with some internal strabismus, and also tended to roll about, particularly during examination. The fundi were normal and the pupils reacted normally to light and to accommodation. There was no nystagmus. The teeth could only be separated about a quarter of an inch with difficulty. Respiration was shallow, but an examination of the heart and lungs revealed no abnormalities. The abdomen was rigid and felt almost like concrete. The limbs all showed a tendency to spasticity, but the tendon reflexes were normal and the plantar reflexes flexor. Knee and ankle clonus was present on both sides. The right external auditory meatus discharged yellowish offensive pus, and examination showed a reddened meatal canal with a mass of granulation tissue obscuring the drum. The left drum was indrawn; the handle of the malleus was pink, but was otherwise normal. Lumbar puncture resulted in 10 c.cm. of clear fluid being withdrawn under slightly increased pressure; there was no globulin. A few red blood cells were probably adventitious.

There were 9,375 leucocytes per c.mm. of blood; 75 per cent. of these were polymorphs. The red cells were normal and showed no sign of malarial parasites. Examination of the aural discharge showed staphylococci and pneumococci.

The patient was given large doses of tetanus antitoxin intravenously, intramuscularly, and subcutaneously, with liberal sedatives. The ear was dressed with hydrogen peroxide. Though the pains and spasms were brought under control the temperature steadily rose, reaching 101.2° F. on the thirteenth day and coming down by lysis, while the pulse varied from 102 to 136. The symptoms rapidly improved from the fourteenth day. Most of the antitoxin was given by the intravenous route, and altogether 299,000 American units (598,000 I.U.) were injected.

The patient was discharged on the forty-eighth day of admission in good health though rather psychoneurotic. The granulations in the ear had retrogressed, revealing a moderate-sized perforation in the lower part of the drum, and there was very little discharge.

COMMENTARY

This case is, I think, most unusual; I can find no similar instance in the literature at my disposal. The clinical features and recovery after antitoxin leave little doubt as to the diagnosis, though the pathologist failed to find *B. tetani* in the fourteen successive daily specimens of the discharge. All showed staphylococci, and many of them pneumococci as well. Tetanus toxin is said to travel along the sheaths of the motor nerves, and in this situation only the small nerves which supply the tensor tympani and stapedius muscles and the chorda tympani, and tympanic plexus, in which there are probably some motor fibres, could easily be involved. There were no obvious signs of interference with the right facial nerve, nor was there evidence of any inflammatory process in the pinna.

The pronounced tetanic symptoms, with comparatively little rise of temperature or pulse rate and practically no leucocytosis, may be due to the fact that while the tetanus toxin reached the central nervous system via the motor nerves, very little of the other products of the inflammatory process were absorbed by the surrounding comparatively avascular bony tissues.

HEALTH OF ROYAL AIR FORCE

REPORT FOR 1936

In the report on the Health of the Royal Air Force¹ for 1936 an increased sickness incidence of 48 per 1,000 of strength over that for 1935 is recorded; this was largely accounted for by increases in the incidence of German measles and influenza. Invalidings from the Service rose from 4.8 per 1,000 in 1935, which was the lowest figure yet recorded, to 5.5 per 1,000 in 1936. These figures compare with average incidences of 6.2 and 9.9 per 1,000 for the periods 1928-35 and 1921-7. Venereal disease again showed a reduction from 9.5 per 1,000 in 1935 to 9 per 1,000 in 1936: this is the lowest incidence since the inception of these reports in 1921. Of the officers of the general duties branch liable for flying duties as pilots 97 per cent. were fit for full flying duties; this is the highest figure yet recorded. Among apprentices there were decreases in all diseases as well as in the incidence of injuries. As in previous years, pneumonia was one of the chief causes of death from disease, as distinct from deaths from injury.

Special Investigations

In all cases of jaundice in the Royal Air Force arising in the United Kingdom in 1936 special notes were made with a view to determining the causes. In none was there any history of recent employment in aeroplane doping. Two of the thirty-three cases were instances of Weil's disease traced to swimming in infected water, one at Dublin and the other at Henlow. One jaundice was the sequel of intravenous arsenical injections, but the majority appeared to be of the so-called infective catarrhal type. One officer contracted kala-azar while in the Aden Protectorate; this disease had not previously been recorded in Aden, and search was made to ascertain its local distribution there. A portable electrolytic water-sterilizing unit, delivering 250 gallons of purified water per hour, was constructed for transportation by aeroplane or motor car. The whole apparatus weighed about 150 lb., packed neatly in two 2-ft.-cube cases, and could be assembled in ten to fifteen minutes, including the time taken to prepare the brine and ammonia solutions. The apparatus proved very efficient, producing a clarified and purified water fit for drinking.

The twelve members of the flying-boat cruise from Malta to West Africa in December, 1936, were protected against yellow fever by inoculation, the serum and virus being prepared at the Wellcome Bureau of Scientific Research, London, and forwarded to Malta by air. The inoculations produced little or no reaction other than slight headache. Additional precautions taken were pressure spraying of aircraft twice daily with "pyrocid 20" and half an hour before departure from any port of call, and the enforced use of mosquito nets by all members of the flight. No medical officer was carried. There was no case of illness. Among the physiological problems affecting the airman particularly attention was given to the avoidance of fatigue, in the interests of efficiency, with special relation to posture, noise, and the purity of inspired air; the risks to airmen of breathing air contaminated even to a very small extent with exhaust or other harmful gases, and the protection of workers in special testing chambers from this risk; the defence of the Royal Air Force against war gas, and the instruction of medical officers and airmen in the principles of self-protection and the care of the gassed, design of buildings, appliances and clothing; the design of flying head-gear, including the masks required for breathing oxygen at great heights and the use of other chemical substances in addition to or in place of oxygen for this purpose; the physiological problems of very high flying, of other work at ultra-low pressures and in great cold, and of the high speed of modern service aircraft; the design of special instruments for the examination of flying candidates and personnel, with particular attention to the predetermination of the ability to learn to become a service pilot; and the mechanical forces en-

countered by the human body in flight, its reaction thereto and protection therefrom.

Improvements in Hygienic Conditions

New types of barrack blocks were built with well-appointed lavatory annexes having slipper, foot, and shower baths and an adequate supply of hot water. Dish-washing machines, either of the revolving brush or of the turbulent type, thermostatically controlled to ensure hygienic washing, were installed in annexes to airmen's dining halls in most barracks of permanent construction. Observations are being made on the comparative value of these two types of machine. Many clothing improvements were introduced, open-neck tunics replacing stiff upright collar types. The drivers of motor petrol tankers were supplied with leather gloves as a protection against petrol dermatitis. Topees lined with aluminium fabric, as an additional protection against heat, were issued on an experimental basis to certain units in the Sudan. A pool system to deal with the bulk disinfection of geographical groups of stations as an economy measure was introduced in some places.

TREATMENT OF YOUNG OFFENDERS

The country first realized in 1908 that delinquency in children was a social problem that needed a constructive solution. In that year, thanks largely to the pioneer efforts of Clarke-Hall, the Children Act, 1908, was passed and set up juvenile courts. The Prevention of Crime Act introduced Borstal training, and the Probation Act of the previous year had given magistrates wide powers of controlling and supervising children outside prisons. Since that time the Home Office, in co-operation with many enthusiastic voluntary agencies, has made great strides in its provision, not only for the optimistic treatment of child offenders, but also for the prevention of juvenile crime. The Children and Young Persons Act, 1933, improved the juvenile courts by providing that they should be conducted by specially qualified magistrates in informal surroundings and empowering them to deal with children requiring special care and protection by placing them in the charge of a "fit person."

The Home Office recently issued its fifth report on the work of the Children's Branch.¹ The report is the first since 1928, and is the work of Mr. J. F. Henderson and Mr. Arthur H. Norris. It shows evidence on every page of the enlightened enthusiasm of these two workers. The reproach is often levelled at the Civil Service that its members are hidebound bureaucrats. The heads of the Children's Branch have shown themselves to be as true pioneers as any of their colleagues outside. The reproach of official obstructiveness cannot be levelled at their Department, which is as ready to initiate reform as it is to encourage the enterprise of voluntary bodies.

Juvenile Courts

The 1933 Act laid down that the justices of every petty sessional division should elect a panel of their number specially qualified to sit in juvenile courts, and that the court should consist of not more than three members, one of whom should, if practicable, be a woman. It was soon found that in a number of divisions no woman justice was eligible. The Lord Chancellor therefore appointed to the peace commission a number of women, and also men, thought to be specially suitable for juvenile courts. In 1936 the Home Secretary issued a circular containing advice on the principles which should be followed in electing the new panels when the three-year appointments made in 1933 expired. The returns showed that fewer men justices and more women justices were elected, and the number of panels containing no woman fell from 212 to sixty-six, these being nearly all in districts where the volume of work is small. An effort is being made to reduce the average age of justices, and

PREHISTORIC PEOPLE OF MOUNT CARMEL

LECTURE BY SIR ARTHUR KEITH

At the Royal College of Surgeons of England on February 14 Sir Arthur Keith, M.D., F.R.S., delivered a special lecture on the prehistoric people of Mount Carmel, in which he described the work of the expedition led by Miss Dorothy Garrod and financed by the British School of Archaeology in Jerusalem and the American School of Prehistoric Research.

The early Palestinians, said Sir Arthur Keith, were quite unlike any people now living, but they were of great interest because, if not our actual ancestors, they were certainly nearly akin to the stock which in the course of time gave to the world its Caucasian or white inhabitants. Hitherto the search for the fossil ancestor of the white man had been in vain, but the excavations made on Mount Carmel by Miss Garrod were destined to give the small country of Palestine a very important place in the picture of prehistoric man.

Man began to inhabit the caves of Mount Carmel long before the onset of the last glaciation in Europe. One cave from an archaeologist's point of view was the richest ever opened; it was filled with fossiliferous earth tramped down by the feet of prehistoric man until an accumulation over 80 ft. in depth had been formed. From bottom to top the strata were full of stone tools, fossil remains of animals—many of them extinct species—and the bones of men and women. It was no exaggeration to say that these deposits recorded the history of man in Palestine over a period of at least 100,000 years, perhaps longer. The strata began while man was still in the early age of stone culture; they left off at about the time of Abraham.

Complete Skeletons Found

The hitherto existing knowledge of fossil man had been built on prehistoric "scraps," but at Mount Carmel complete skeletons had been found. One small cave excavated by Mr. T. D. McCown of the American School proved to be a veritable cemetery. The fossil remains of ten individuals were found in it, three of them complete skeletons. All the individuals save one were under 50 years of age; the expectation of life among these early inhabitants of Palestine was not good.

The completeness of this representation of a prehistoric community was due to two circumstances: the careful way in which the dead were buried, and the fact that Mount Carmel was composed of limestone, which preserved bones better than any other rock, although it was a stone which made extraction extremely difficult. The bone-containing breccia, hard as cement, had to be cut away in blocks weighing a ton or more and conveyed from the slopes of Mount Carmel to Lincoln's Inn Fields, where the rougher work of extraction was done. The finer work, including restoration, was done at the Buckston Browne Farm at Downe in Kent. Here, within sight of Darwin's old home, Sir Arthur Keith and Mr. McCown "had brought the old Palestinians to life."

The Book of Genesis stated that before the flood there were giants in the land. These fossil people were not quite worthy of the name. The men were from 5 ft. 8 in. to 5 ft. 11 in. in height; the women were very short, from 5 ft. to 5 ft. 4 in. It had been possible to study every bone of the feet, hands, and arms. These people had straight and strong limbs and ample chests. Their spinal vertebrae retained certain simian details in their conformation. It had been possible to measure their heads and in some cases to take casts of their skull cavities. In point of size they had brains equal to those of modern man, but of simpler convolutionary pattern. The muscles of their tongues were attached to their lower jaws as ours were, and all the parts of the brain which indicated capacity for speech were present. But in their

anatomy they still retained many primitive marks. Their eyebrow ridges, like those of the gorilla, formed great bars of bone above the orbits, their jaws were massive, their mouth cavities capacious, and their necks exceedingly thick and strong.

Nowhere in the world to-day could there be found a local group of people showing the wide range of structural variation of these fossil Palestinians. Their chins were at every stage of evolution, from a chinless stage comparable to the chimpanzee to chins moderately developed. In some of them the nose form might well have been the prototype of the Roman; in others an almost negroid type prevailed. One woman had her closest affinities with the primitive Neanderthal type of Europe; one man might have been a crude form of the early European. They appeared to be a plastic folk in the throes of evolutionary change.

Relation to Neanderthal Man

Before the last glacial epoch Europe was inhabited solely by peoples of the Neanderthal type; their fossil remains had been found as far west as Jersey and as far east as the Crimea. Eastwards the type approximated somewhat to that now found in Palestine. In Mount Carmel there was a people whose date was earlier, not later, than that of the Neanderthals of Europe. In the points where the Palestinians differed from the Neanderthals they were Caucasian or modern. Was Palestine, then, the homeland of Europeans? That was not the inference Sir Arthur Keith was inclined to draw. He believed that, as research was carried further into Western Asia, the fossil remains of men who had still less of the Neanderthal in them and more of the modern man than was the case at Mount Carmel would be found. The first glimpse obtainable in Europe of the early Caucasians or whites was at the time of the passing of the crisis of the last glaciation. They then appeared in South Europe as Cromagnons and in Central Europe as Predmostians. The discovery at Mount Carmel suggested that their homeland would be found in Western Asia. The tall men of Mount Carmel might not be the ancestors of the Cromagnons, but only distant relatives.

The most surprising result of these excavations was the light thrown on the mentality of the early Stone Age. Care of the dead was one of the hallmarks of humanity, and the Mount Carmel people showed great care for their dead. The youngest child was placed in its grave in a sitting position with limbs flexed under the trunk and arms folded. The tallest man had in his embrace the fossil jaw of a boar, not, of course, buried with him in the fossil state but evidently carrying with it a meal—pig's tongue—of which he was fond.

The Oldest War-wound

When the hip-joint of one of the men was cleared of the limestone breccia it was found to be shivered, and on closer examination a perforation was found at the centre of the injury. A cast was taken and revealed the image of a four-sided spear head. It had not been known that such weapons were invented at so early a date. It had been thought that the only fighting weapons possessed by these early men were stone clubs. A spear to penetrate the whole thickness of the hip-joint of a large-framed man and to enter the pelvis, as this weapon did, must have been finely tempered and driven with exceedingly great force. Even at the very early period represented by the caves of Mount Carmel man was already a fighter, and could be cruel as well as kind. This Mount Carmel hip-joint represented the oldest "war-wound" known to surgeons.

Signor Luigi Bizzozero, the son of Giulio Bizzozero of blood platelet fame, has bequeathed 10 million lire to the Ospedale Maggiore, Milan.

ANALYSIS OF CASES OF SYMPATHETIC OPHTHALMIA FROM SCHOOLS FOR BLIND CHILDREN

In the course of the investigations of the Prevention of Blindness Committee a report was presented by a member of the Specialist Subcommittee on Sympathetic Ophthalmia in children. In the belief that the report may be stimulating and provide food for thought they submit it for medical publication in the hope that this will be provocative. It is realized that owing to the small number of cases no accurate generalizations can be made. From the analysis of the cases of sympathetic ophthalmia it will be seen that the earliest case of injury occurred in 1921 and the two most recent as late as 1936. Eleven patients were treated at hospital, eight of them immediately or the day after the accident and one a week later having previously been treated by a medical practitioner; in two cases information on this point is not forthcoming.

The promptitude with which medical advice was sought does not seem, contrary to accepted principles, to have prevented the onset of what is probably the most disastrous calamity in ophthalmic surgery. One is forced to ask whether this is because the seriousness and proper treatment of injury to the eye are not adequately

realized. Another striking fact is the high proportion of urban cases supposedly within easy reach of expert surgeons with all the equipment of properly found hospitals to hand. Furthermore, four injured eyes were removed after the onset of ophthalmia neonatorum. It is generally recognized to be better practice to leave the injured eye *in situ* after the onset of sympathetic ophthalmia, since the results of the inflammation in the sympathizing eye are so destructive to vision that frequently the injured eye has the better sight of the two in the end. Moreover, removal of the injured or exciting eye has little or no influence upon the course of the disease in the sympathizing eye. These considerations so exercised the minds of the medical members of the committee that, in order to obtain a wider publicity, they have sought publication of their findings in a channel not usually employed by the committee. Full information regarding the onset of sympathetic ophthalmia was not available in all cases; the interval between the injury and the removal of the injured eye varied, in the ten cases where details are given, from "almost immediately" to one year.

Five cases said to be sympathetic ophthalmia have been rejected: three cases owing to the nature of the injury (lime burns, "fly into eye," struck by tennis ball) and two because the nature of the injury was not known.

the clerks to justices are invited to include the ages of their magistrates in their returns. Some justices (or their clerks) have exhibited a reluctance—shy, indignant, or coy—to disclose precise particulars of age. One clerk, the report relates, returned the ages of the men justices but begged to be excused from the delicate task of asking the women justices their ages. Very few indeed are under 50, and the largest age group is 60–69. In London the juvenile courts are also staffed by lay justices. The Department is satisfied that justices in general take great pains in obtaining full information about the cases before them and consider carefully the various methods of treatment open to them before making their decision. The Portsmouth panel give, in their reports, a formidable list of persons and organizations, official and unofficial, whom they constantly consult.

The figure for boys found guilty of indictable offences since 1929 (the number of girls is negligible) has doubled. The report observes that there are those who regard the change as insignificant, because at their highest the figures represent a very small fraction of the total number of boys in the country. Moreover, it says, law-breaking by boys is far less serious than law-breaking by adults. Often it is a manifestation of the spirit of adventure and is not deliberately anti-social. Some young offenders are mentally below normal and therefore less responsible, and there are no professional criminals among boys. There has undoubtedly been a large rise since the Act, and this, the authors of the report explain, is due to the Act itself, with its much greater opportunities for turning young offenders into honest citizens. The approved schools get a large percentage of dull and backward children; and this aspect of delinquency is to be specially investigated, in addition to the general inquiry which the Home Secretary is shortly making into the whole problem of juvenile delinquency.

Psychology in the Juvenile Courts

Juvenile courts are coming more and more to seek the advice of medical psychologists, which often throws valuable light on the reasons for a child's conduct. The report, however, points out that whatever psychological advice is available the responsibility for acting on it rests with three lay justices. This fact may not always be sufficiently present to the mind of the specialist. The ordinary member of the public has not yet gained complete confidence in medical psychology—and indeed, considering the chaos of jarring atoms which is the present state of medical psychology in the country, this lack of confidence is not in the least surprising. When medical psychologists have so little confidence in one another the layman can hardly be blamed for not having more.

The skilled psychiatrist, the report says, is handicapped by two facts: his technical language is popularly used by many people who do not really understand it; and serious psychology is discredited by a large number of amateurs and charlatans. In some cases where the diagnosis of a child's motives is difficult a report by a skilled and experienced medical man is of great value. As courts come to realize this fact they will probably make a correspondingly greater use of psychological advice. There are also unusually difficult cases in which the court would feel itself to be on surer ground if the child could be observed for long enough by a skilled staff in a residential centre. The Goldsmiths' Company has offered the Home Office £6,000 towards the establishment of an observation centre primarily for London children, and the starting of an experimental centre on a modest scale is being considered.

Methods of Treatment

The most difficult task of juvenile courts is to decide what method of treatment to apply to a boy or girl who has committed an offence, needs care or protection, or is

beyond the control of the parents. A court may make a supervision order in respect of children in the last two classes. Courts are gradually making more use of this power, and the Home Office hopes to have the law amended to enable a court to impose the conditions of residence and others which may be imposed in a probation order. The "fit person" to whom the court may commit a child in need of care or protection is often a local authority, which must place the child with foster-parents and not, except with the Home Secretary's consent in special cases, in an institution. It is hoped that in course of time juvenile courts and local authorities will make a greater use of this power, which can also be exercised over offenders.

Hitherto complaints by school inspectors of truancy have been heard before ordinary courts, which usually send the child to an approved school. The 1933 Act allows the court as an alternative to commit the child to the care of a fit person—that is, the local authority for boarding-out. This alternative has hardly been used at all, probably because the ordinary courts are not familiar with the power to commit to the care of a fit person. In practice there is no distinction between truants and children in need of care and protection. After consulting a large number of associations and authorities the Home Secretary has advised the Lord Chancellor to make rules assigning truancy cases under the Education Act, 1921, to the juvenile courts, and it is expected that these rules will very soon be made. The authors of the report hope that courts and education authorities will bear the alternative and less drastic method of boarding-out in mind when dealing with truancy.

Nearly all the indictable offences for which children and young persons come before juvenile courts are thieving or dishonesty of some kind. About a quarter of the cases are dismissed, half are put on probation, a tenth are sent to approved schools, and an insignificant number are committed to the care of a fit person. The report says that a very small number are ordered to be birched—146 in 1934, 211 in 1935, and 155 in 1936. Considering the overwhelming evidence that birching is a thoroughly bad form of punishment, it seems a pity that the authors of the report have not specifically condemned it. They remind the courts that it is within the power of a court to underline the importance of parental responsibility by requiring parents to enter into recognizances for their child's good behaviour. The stipendiary magistrate at Salford found the result entirely satisfactory in ten cases out of sixteen. There must, of course, be an understanding that the order is not made as a punishment to the parent, and that if the parent co-operates it will not be enforced even if the child lapses.

A Valuable Survey

The report contains much valuable and interesting matter which cannot be summarized here. The constructive training and recreation given in approved schools is immensely important and not by any means fully realized. How many people, for instance, know that the children get annual home leave, during which they often find jobs; that they go to holiday camps and on tours in the summer? The report also contains scathing remarks about the arrangements in some voluntary homes for girls.

To sum up, the Act needs the co-operation of many different authorities and interests, and cannot be applied all at once. With each year its application will probably become more varied. The growing interest in everything concerning children is leading to their more intelligent treatment by the courts. The fact that the amount of adult crime is either stationary or declining suggests that in the recent past offenders have been treated on the right lines. The treatment applied under the new Act to the children of to-day will therefore probably reduce it still further.

mittee or to the council direct if there is no other remedy for a state of affairs involving risks to the public health. If intrusions of this character are unwelcome to the council he is to some extent protected from reprisals by his exceptional security of tenure.

Every local authority should make satisfactory arrangements for the laboratory examination of samples of water, and it would appear to be desirable that the Ministry of Health should give detailed guidance as to the nature of the examinations and the frequency of sampling. The long experience of the Metropolitan Water Board indicates that changes take place so suddenly in the quality of water from wells in the chalk that some bacteriological examination should be made daily, at least in periods of drought and on succeeding heavy rainfall. In matters of this kind, involving increase of expenditure, the initiative or support of the medical officer of health is of paramount importance. He is certain to be asked in future if all employees likely to come in contact with water should be examined for the detection of the carrier state. If these workers are in comparatively stable employment the initial examination of new employees may be a practicable undertaking, although it would be idle to pretend that negative findings from examinations of an extent which would be tolerated would give a 100 per cent. guarantee of safety; and the maintenance of a probably non-infective state of the employees can be promised by the health department only if full and prompt information, including medical certificates, will be furnished to it of all intercurrent illnesses of these workers.

In connexion with the Croydon inquiry alleged defects in the relations between health departments and the local members of the medical profession have received a good deal of publicity. Mr. Murphy in his report accepts the view that "in all large areas there should be some committee representing all the local practitioners, which, upon the occurrence of any outbreak, would be in constant and close touch with the medical officer of health and would provide the means of pooling and distributing all the information available from time to time as to symptoms and possible causes." It is clear that where no recognition of the local Division of the British Medical Association or any other medical committee has been extended by the authority the occasion of a sudden epidemic is unfavourable for the improvisation of such a form of contact by harassed officials. Communication from the health department by letter is more expeditious and more certain. The discovery of an epidemic in the Press, however unsatisfactory it may be, should not be regarded as an offence

to the profession. It is impossible to prevent the daily newspapers from giving publicity to occurrences they regard as news, often before a well-informed medical officer is satisfied that anything has happened which it is necessary to convey to his medical colleagues. Press publicity, too, is much more rapid than conference or even correspondence, and is not restricted by any exaggerated sense of responsibility. But much of the feeling engendered by such events would be avoided if a local medical committee, preferably recognized by statute, were available to confer with the medical officer of health, to receive a frank statement of his problems, and to take the burden of local medical uneasiness and the interchange of information and opinions off his shoulders at a time when his attention must be devoted to practical inquiries of a more specialized kind. The public are less likely to be captious in their criticism if they know that all or the majority of their family doctors are behind the measures taken by the health department and are satisfied that the difficulties of such an emergency are being overcome with the minimum of delay. The profession should understand that in offering their active assistance they will be undertaking no light task at a time when the demand for their ordinary services may be abnormal.

PSYCHOLOGY DOWN THE AGES

Professor Charles Spearman, drawing upon his ripe experience, has endeavoured in a recent work¹ to steer a clear course among the warring sects who all claim that they represent the whole truth and nothing but the truth in psychology, and to expound how far scientific psychology has really made progress. The origins of psychology in the conception of the spirit or geist are described, and then the various efforts on the one hand to attach psychology to physiology and on the other hand to detach it from bodily conceptions. Further, the relation of psychology to the various philosophical theories is discussed and how far it can progress independently of these. The methods of psychology still depend to a large extent, as they did in the time of Aristotle, on the study of sense perception. "Intelligence," which held the field for so many ages, has lately fallen from favour, though the establishment of tests has made some think they know all about this difficulty. Professor Spearman does not share that view, and, while regarding tests as useful, utters a warning against a too facile acceptance of their implications.

Attention, whose definition has been so variable, seems now to combine an intellectual connotation

CONSIDERATIONS FROM CROYDON

The report on the outbreak of typhoid fever at Croydon by Mr. Harold L. Murphy, K.C., appointed by the Minister of Health to inquire into the outbreak with the assistance of Sir Humphry Rolleston and Mr. H. J. F. Gourley as assessors, was published on Monday, and a full summary of it appears at another page in this issue. As has long been known, the outbreak was the result of infection of the public water supply by the typhoid bacillus, and the circumstances point strongly in the direction that the well was infected by a workman who was a typhoid carrier working in the Addington well between the end of September and during October. During large parts of this period water from the well was being pumped to supply, unfiltered and unchlorinated. In the report stress is laid upon the "misunderstanding and lack of communication between the responsible officers of the Corporation in connexion with the work." Dr. O. M. Holden, the medical officer of health, had not been informed that the work was being carried out at the Addington well, nor that filtration and chlorination had ceased. He was not asked to examine the men chosen for working at the well. Mr. Murphy in his report states: "I have been told that they were carefully selected for physical fitness out of a very large number of volunteers. I am unable to accept this evidence." The report concurs with the opinion expressed by counsel in describing Dr. Holden as a "loyal, able, and industrious servant of the Corporation as well as a truthful and careful witness." Praise is given to the hospital and nursing arrangements and the medical conduct of the epidemic. Mr. Murphy states: "It appears to me that the only legitimate criticism that can be directed to Dr. Holden in this case is a slight delay in his realization that 'water' was or might be the cause of the epidemic. . . ." But, "the dates of the various cases render it unlikely that any infection was caused by this short delay. . . ."

Certain considerations arise from these events in Croydon which are of importance to the public, the medical profession, and, more intimately, to local authorities and their officers. Many of the functions of local authorities, although they have a bearing on the public health, are not of such a character that they call for frequent medical intervention. To such belong, for instance, the

provision and management of sewers and drains, the disposal of refuse, the construction of buildings in which human beings live and work, the acquisition and control of parks and open spaces, the control of animal diseases, the arrangement of hours of work and play for school children—both at school and at home—and for their supplementary feeding. The list of examples could be extended almost indefinitely. On each of these activities the influence of expert medical opinion ought to be felt; on some its exercise should be more direct than on others, but of none could it reasonably be contended that a medical officer should be in day-to-day control. Water supplies are in this category. When a reliable source has been found, the method of treatment adopted for ensuring the delivery of a pure supply to the consumer, and a system of tests of the efficiency of these measures devised, the very large business of management requires mainly engineering qualifications of a specialized kind. While this is so, the medical officer of health may reasonably be thought to have some concern with a service that is of such vital importance to the health of the people. The Sanitary Officers (Outside London) Regulations require him to "inform himself as far as practicable respecting all matters affecting or likely to affect the public health." At the end of each year he is required by the Minister to furnish specified particulars about the water supply, including a statement as to whether it has been satisfactory in quality and quantity. Whatever legal interpretation may be put on these Regulations, he may properly make up his mind as to the suitability of the source of water, the efficacy of its treatment, and the frequency and adequacy of the bacteriological and chemical tests applied. Even if he finds it unnecessary to take samples through his own department the reports of any routine and special tests made should pass through his hands. It may be noted that the Regulations make it his duty not to advise but to "be prepared to advise" the council on any such matter, a form of words suggesting rather that the council should seek his advice than that he should proffer it. But the public is not likely to have much patience with such refinements of interpretation. As a matter of courtesy a medical officer of health will prefer to make his representations through the officer in charge of the water department, and the committee to which the latter is responsible. Administration is most successful when there is constant, friendly contact between the heads of departments, each acknowledging the duties and difficulties of the other, but it ought to be made clear, if there is any doubt, that the medical officer of health may take his dissatisfaction to the public health com-

of the *Journal* Dr. A. S. Parkes discusses the recent experimental work which has been undertaken to achieve constancy of delivery of the hormone administered. Oral application and local inunction have the advantage of dispensing with the inconvenience of injection, but unfortunately neither of these routes is applicable except to two hormones, thyroid and oestrin, and to the latter only in a limited degree. Fortunately there are certain clinical indications for the use of oestrin which require only very low concentrations, such as the menopausal syndrome, for which oral administration of oestrone or oestriol is effective, the latter being more completely absorbed from the intestine on account of its greater solubility in the body fluids. Inunction of oestrin, though effective, has few indications. Oral administration of thyroid is of course highly satisfactory. Anterior pituitary hormones, contrary to the views expressed by many authorities, are completely ineffective by mouth. Dr. Parkes is more especially concerned with the form in which the sex hormones are most suitably prepared for intramuscular injection. The chief object has been to combine the pure hormone with some ester which will decrease its solubility in the body fluids and therefore render its absorption from the site of injection more gradual. For the oestrogenic hormones the benzoate appears to be the most suitable vehicle, and if administered in the form of oestradiol benzoate the effect of each injection lasts for about three days. The male hormone, testosterone, appears to retain its effect for about a week if given in the form of the propionate. Unfortunately progesterone is difficult to esterify, and though the duration of activity of the pure hormone may be longer than in the case of the other sex hormones it is probably advisable to give injections daily or even twice daily, especially in such cases of emergency as threatened abortion. The greatest advance towards the solution of the problem, however, is Dr. Parkes's own observation that if pure crystals of the hormone are tightly compressed into the form of a tablet and this is then implanted subcutaneously the duration of activity is greatly prolonged owing to very slow absorption of active material from the surface of the tablet. This observation demands the closest attention of the clinical endocrinologist, and is indeed already being put to practical trial in at least one endocrine clinic in this country. The application of this method to crystalline oestrone for the menopausal syndrome, to progesterone for habitual abortion, or to testosterone for prostatic hypertrophy opens up a promising avenue for clinical research.

A SURVEY OF CHRONIC RHEUMATIC DISEASES

In 1938 the National Hospital for Rheumatic Diseases, Bath, celebrates the bicentenary of its foundation. To mark this event an international conference on certain aspects of rheumatic diseases will be held at Bath, as has already been announced in our columns, but in addition a volume, to be entitled *A Survey of Chronic Rheumatic Diseases*, will be published by the Oxford Medical Publications Ltd. This will comprise a series of articles on the chief aspects of rheumatism and gout

arranged and edited by an editorial committee, under the chairmanship of Dr. R. G. Gordon, which was appointed by those responsible for arranging the bicentenary celebrations. The committee has been fortunate in obtaining articles from such eminent authorities, among others, as Sir Humphry Rolleston, Drs. Buckley, Copeman, Douthwaite, Edgecombe, Glover, Poynton, and Thomson in this country; Professors Ghormley, Hench, Osgood, and Pemberton from America; and Professors Aschoff and Besançon, and Drs. Freund, Kahlmeter, van Breemen, and Weil from the Continent of Europe. Various schools of thought are thus well represented, and it is hoped that the volume will be an interesting and valuable addition to rheumatological literature, and prove a worthy memorial to the past traditions of the hospital and an earnest of future contributions to the advancement of the special studies with which it is concerned.

EXCISION OF THE PATELLA

Sixty years ago Lister put his faith in the value of the antiseptic method to a supreme test by performing an open operation on a fractured patella.¹ The fragments were wired together and there was no unfavourable reaction after the operation. Since those days surgeons' efforts have been directed to improving the technique of this now widely accepted treatment by internal fixation, for the functional results after wiring of the patella have been by no means uniformly satisfactory. Last year Mr. Ralph Brooke² showed a number of patients at a clinical meeting of the Orthopaedic Section of the Royal Society of Medicine—patients with fractured patellae that had been dealt with by excision. The results were astonishing. In almost every case normal function had been restored, and apart from the scar of operation and the absence of the knee-cap it was impossible to distinguish the damaged from the normal joint. It would appear that this cherished bone, the patella, is superfluous; or at all events, if the bone is broken, it is best to get rid of it. On another page Mr. G. O. Tippet has reported satisfactory results in six cases treated by this operation, four of fracture and two of osteo-arthritis in which the patella was particularly involved. This is all excellent, but we cannot help feeling that this new form of treatment, which has made such a promising start, may come to grief if practised by any and every one who calls himself a surgeon. It sounds, and is, so easy for a man who is accustomed to performing open operations on joints. But the knee-joint, and particularly a clean one, must be approached with a technique that might almost be described as reverential. A slip may be followed by swift disaster in the shape of intra-articular haemorrhage or infection. Then, too, in this particular case, it is important to restore the integrity of the extensor mechanism by careful suturing of the torn capsule. Last, or perhaps first, there is the choice of the appropriate case. A warning that mistakes may be made in this direction appears in our correspondence columns this week, at page 418,

² *Brit. J. Surg.*, 1937, 24, 733.

with something of Stoic dynamism. This leads to a consideration of sense perception which may be contrasted with intellect, each having been credited with the primary role in psychic function. Memory and imagination are also faculties which have been much discussed, and it is not yet determined how far these are able to influence a number of other manifestations. Much work has been done in attempting to arrange and classify the feelings and emotions of men, but the result is still indeterminate. Professor Spearman discusses the criticisms of "faculty psychology," and, while admitting that the view that the psyche is made up of a number of fundamental faculties leads us into great difficulties, he argues that the abandoning of such faculties has produced a confusion which is little short of chaotic. He then describes his own analysis of sensory perception and lays stress on the importance of relation and forms. He points out that several important constituents may be discovered which are not recognized by "common sense." In this connexion we have to consider not only the objective matter which is regarded but also the subjective method of regarding; and thence we pass to a consideration of thought and how it is achieved. In present-day psychology this study has been rather neglected. Orectic, or the drive behind action, involving as it does feeling and choice and resolve, is reviewed from the scientific angle. The question of the analysis of emotion and the true nature of pleasure is still unanswered, and consequently the attempt to synthesize units of behaviour must remain difficult and complex, though fascinating. All these problems have exercised psychologists from the earliest times, but we now find in the unconscious mind an entirely new study which, though still in a state of confusion, may be very highly important. The problem of I and Me has always exercised philosophers, but the methods of experimental psychology are beginning to throw light on this also; it would appear that the concept of mental unity cannot be upheld, and this leads Professor Spearman to condemn the thesis of the Gestalt school. The history of psychology is not one of continued progress; there have been, and no doubt will be, many false starts and false conclusions.

Opinion has differed much on whether psychology can establish scientific laws or even whether any are necessary. What pass to-day for psychological laws may not be very exact, but several of those enunciated on general lines have received more or less firm acceptance. The best known is perhaps the law of association, which has been very helpful in the advancement of psychology. So have the law of retentivity and the theory of dispositions—closely associated with mental inertia and resistance

to change, which, so to speak, keeps the mental processes on the rails. That the individual can exert control over thoughts, feelings, and actions seems obvious enough, but the explanation is far from precise, though a beginning has been made. The control depends very largely on attention, and a study of it suggests that there is a limit to this power, but that the output is constant in any individual. Fatigue is of the greatest importance psychologically and a good deal has been done in defining the operations and effects of this factor. Some of the "laws" in relation to knowing, feeling, and acting are obvious to common sense, while others are scarcely delineated so far, but the author foreshadows certain advances in these fields, as in the matter of body-mind relationships, which may do much to clarify the issue. If the modern "type-psychology" is closely examined it appears very spectacular, but whether it has any surer foundations than the old "faculty psychology" may be doubted. Professor Spearman believes that if we are to get at the basis of "what goes with what" we must study correlation coefficients, and it was by this method that he worked out the G and S factors, which will always be associated with his name. He regards this as the most important advance in the modern psychology, especially if G proves to be innate. The statistical method is being extended to an inquiry into orectic (affective-conative) factors, and this holds out great promise, so much so that he clearly believes that as a method of study it will eventually displace all others in psychology. As a history of psychological thought leading up to this method his survey is full of interest, and, since close observation of the individual reactions to life is becoming increasingly important in many branches of medicine, it is well worthy of the attention of our profession.

ADMINISTRATION OF HORMONES

The fundamental aim of endocrine therapy is to obtain a relatively lasting action of suitable concentrations of the hormone extract on the effector organ. Experience shows that administration of the pure hormone by injection, particularly if in aqueous solution, merely produces a transient rise in its concentration in the blood stream, so that its effect is evanescent. Thus in order to activate the organ concerned injections must be repeated at frequent intervals, and even then there is no maintenance of a steady level of activity but rather the periodic delivery of the hormone to the effector organ in a series of concentration peaks, the greater part being rapidly excreted from the body. In these circumstances it is difficult to decide upon a physiological dose, for the organ is never submitted to the effects of a constant dose. Apart from these considerations the practical inconvenience of multiple injections is obvious. In an article in the present issue

surface of one tooth while the surface of the tooth next to it is unaffected. They found 179 such lesions in 516 "full-mouth" x-ray films selected at random. Obviously food fermentation, bacteria, and possibly some obscure changes in the composition of the saliva cannot account for the development of unilateral caries. An analysis of the possible variations in the environment of the teeth—for example, the presence of a bacterial plaque on the affected tooth only, the retention of a carious deciduous tooth next to the adjoining permanent tooth, etc.—has failed to account for most of the cases observed. Variations in resistance most probably therefore explain the observed variation in the incidence of caries in different teeth. From the "Dental Survey of School Children" published by the United States Public Health Service (Bull. 226) Mills³ has made the following observations: (1) The incidence of caries in American school children increases steadily throughout the United States as the distance from the Tropics increases. (2) There are indications of diminishing incidence of caries as one passes from the mouth of a river toward its head waters. (3) There is an inverse relation between hardness of drinking water and incidence of caries, cities using river water showing about 30 per cent. more caries than do cities using well water. (4) There is a direct relation between incidence of caries and the amount of salt employed in seasoning food. (5) Negro children in all areas have less caries than do the white, but the same regional relations obtain. The observations show that dental decay bears certain definite relations to extrinsic factors which in one way or another influence the metabolic processes of the teeth.

DR. WU LIEN-TEH

After thirty years of continuous and faithful service under the Chinese Government Dr. Wu Lien-Teh, first Director of the National Quarantine Service, and also of the Manchurian Plague Prevention Service, has retired from his official duties. Dr. Wu (or G. L. Tuck as we knew him in this country) was born in the island of Penang, Straits Settlements, in 1879, and studied medicine at Emmanuel College, Cambridge, and St. Mary's Hospital, London, graduating in medicine in 1902, after a distinguished student career. His thesis for the Cambridge M.D. in 1903 described the results of an investigation on tetanus. He then engaged in research on malaria and other tropical diseases under Sir Ronald Ross at the Liverpool School of Tropical Medicine, under Professor Karl Fraenkel at Halle, and under Professor Metchnikoff at the Pasteur Institute, Paris. Some months at the Institute for Medical Research, Kuala Lumpur, were followed by three years of private practice in Penang. In 1910 the Manchurian Imperial Government sent Dr. Wu to Harbin to control the serious outbreak of pneumonic plague, and largely through his organizing ability the epidemic was suppressed within three months. In recognition of this work he was elected president of the international plague conference at Mukden in 1911. Since then he has held positions of high responsibility under the National

Government in China, having been appointed in 1930 as chief technical expert of the Ministry of Health, and director-general of the National Quarantine Service based at Shanghai, while still retaining charge of the North Manchurian Plague Prevention Service, for which he was chosen in 1912. Dr. Wu has made many contributions to medical literature, chiefly on plague and cholera, and he is part-author, with K. C. Wong, of a history of Chinese medicine. He was a founder and president of the Chinese National Medical Association and for fifteen years edited the *National Medical Journal* (now enlarged into the *Chinese Medical Journal*).

A MERE FLEA-BITE

In 1916 the late James Waterston published as No. 3 of the British Museum (Natural History) Economic Series a very readable pamphlet on *Fleas as a Menace to Man and Domestic Animals: Their Life-History, Habits and Control*. A second edition appeared in 1920, and now it is followed by a third (price 4d.) revised by Professor P. A. Buxton. During the past sixteen years much has been added to our knowledge of fleas, their behaviour and their importance; and in revising the pamphlet Professor Buxton has taken note of new work and placed his special experience at the disposal of the Trustees. The medical bearings of the subject are well and briefly stated in the introduction: "Against the flea a clear and damaging case has been made out. Fleas are known to transmit the bacillus of bubonic plague, from which there were upwards of 7,000,000 deaths between 1896 and 1911 in India alone. Fleas are also concerned in the transmission of certain types of 'endemic typhus,' a disease of human beings in several tropical countries. A flea also acts as the intermediate host of a tapeworm found, in the adult state, in both dog and man; much loss is annually caused to poultry rearers in the tropics and certain portions of the United States by the drain on the health of their stock due to a sedentary flea, while a closely allied species attacks man, causing painful sores or even crippling if neglected. Such an indictment, apart altogether from the pain of flea-bites, with their subsequent swelling, and the discomfort caused to sensitive skins by the insect's movements, more than justifies the attention now given to this group of parasites." As Swift wrote, though in a different context: "So naturalists observe a flea." Having accurately observed its habits and life-history, and its powers for evil, the entomologist can tell us means for its control. Banish or cleanse the flea's hosts, he says, and destroy its breeding centres. All floors should be thoroughly washed and all cracks filled. Naphthalene is perhaps the most useful agent for fighting fleas in dwelling-houses.

Professor Simon Flexner, M.D., formerly Director of the Rockefeller Institute for Medical Research, will give a public lecture, on epidemic poliomyelitis and epidemic encephalitis, in the Physiological Department of the University of Cambridge on Monday next, February 21, at 5 p.m.

³ *J. dent. Res.*, 1937, 16, 417.

in a letter from Mr. Jackson Burrows. In two cases he has seen, excision of the patella for recurrent dislocation was an unqualified failure. Mr. Tippet has given a good summary of the indications for excision, but one of them is "congenitally displacing patellae." If by this he means recurrent dislocation of the patella dating from early in life, then it would have been wise to support this recommendation with reports of cases treated successfully by excision of the patella. In the light of Mr. Burrows's warning we cannot accept recurrent dislocation as an indication for excision. It is to be hoped that this very definite advance in the treatment of lesions of the patella will be received with the caution and respect that it deserves.

AN INTERNATIONAL PHARMACOPOEIA

With a view to the international unification of pharmacopoeias, the Health Committee of the League of Nations has decided to appoint a Technical Commission of Pharmacopoeial Experts. This recommendation was approved by the Council of the League of Nations at its January meeting. The following have been invited to constitute the commission: Dr. C. H. Hampshire, London (Chairman); Professor H. Baggesgaard, Copenhagen; Professor V. E. Zunz, Brussels; Professor M. Tiffeneau, Paris; Professor R. Eder, Zürich; Professor L. van Itallie, Leyden; Professor E. Fullerton Cook, Philadelphia; and a member of the Union of Soviet Socialist Republics. The work of this commission will be, in the first place, to prepare a programme of studies, including the selection of suitable drugs for examination and the determination of a uniform method of analysis, assay, and preparation of the drugs selected. The technical examination will then be distributed among a number of national pharmacopoeia commissions. It is intended that the results of the studies thus carried out with the co-operation of the various national pharmacopoeia commissions shall take the form of a series of monographs on the different drugs. These monographs would be forwarded to the permanent secretariat in Brussels for circulation among the parties to the International Agreement for the Unification of Pharmacopoeial Formulas for Potent Drugs of 1929, with a view to their being adopted and eventually embodied in an international pharmacopoeia of powerful remedies.

RESEARCH INTO DENTAL CARIES

Lady Mellanby's pioneer work on the influence of diet on caries in children's teeth showed clearly that a relatively high vitamin D content of the food can do much to diminish the incidence of caries, particularly if given during the development of the teeth. It can even delay the onset and spread of caries if it is given after the teeth have erupted. Moreover, when the supply of vitamin D was inadequate different cereals were found to have an anti-calcifying influence on the teeth in different degrees, oats being the worst cereal in this respect

and white flour and rice being the least harmful. Osborn and his co-workers¹ are fully convinced that some teeth decay because they are poorly made or because they are weakened from within through some severe disorganization of the calcium and phosphorus metabolism of the individual, owing to lack of vitamin D or to some other factor. But they are equally convinced that some teeth decay because their exposed surfaces are attacked by acid-producing bacteria. This was demonstrated by carefully controlled *in vitro* experiments. Undecayed normal teeth were obtained from patients who had been advised to have multiple extractions, and the teeth were divided into groups as much alike as possible. Each group was immersed in a preparation made of the substance under examination, which had been held in the mouth of one of the workers for two minutes and well mixed with saliva. In one experiment the influence of crude sugar-cane juice and saliva was compared with that of pure sucrose and saliva, the control being a mixture of saline and saliva. In further experiments whole wheat meal and white flour, whole mealie meal and highly refined mealie meal (60 to 70 per cent.), and whole mealie meal and 90 per cent. extraction mealie meal were respectively compared, the same control of saline and saliva being used in each experiment. In every instance it was found that the teeth in the refined material decayed more than those in the unrefined, and those in the unrefined more than those in the saline. It was therefore concluded that the crude carbohydrates have associated with them some "protective agent" which tends to inhibit their injurious action on the teeth. Osborn and Norisken² have recently made a second investigation of the diet of the South African Bantu in an attempt to discover why civilization brings decay to Bantu teeth. Young males of 15 to 25 years of age who had not worked in towns or in mines (that is, had not come too much under European influence) were questioned as to their diet. With the possible exception of sweet potatoes no correlation was found between any item of the native diet and the incidence of caries. It was, however, evident that machine-ground mealie meal, white bread, and refined sugar were associated with caries, and it is suggested on the strength of this evidence and the experimental work described above that sugar cane and/or wheat are accompanied by a "protective agent" which is removed in the refining processes. By disturbing the calcium-phosphorus ratio in the blood, by whatever mechanism, Blackberg and Berke³ induced a pathological condition of the pulp of the teeth which was followed much later by visible lesions in the enamel. Repeated injections of small doses of parathormone into rats whose diet contained calcium and phosphorus in either a very high or a very low ratio brought about a more definite development of caries than was found in the uninjected controls. In animals fed on a complete diet the pathology produced by parathormone was most obvious. Bödecker and Ewen⁴ have investigated the problem presented by unilateral dental caries, which is defined as the occurrence of caries on the proximal

vaccines and sera in the treatment of carbuncles has not found much favour, but Ovens reports good results following the injection of anti-staphylococcal serum intramuscularly.

The local treatment of the carbuncle consists in applying a 12 per cent. solution of sodium sulphate. This is less painful and more easily applied than magnesium sulphate paste, and also less painful and more efficient than hypertonic saline, which is sometimes used. The solution of sodium sulphate is warmed to body temperature and several pieces of gauze (stuffed up, not evenly folded) are soaked in it and put on the carbuncle. They are covered with a piece of jaconet, over which is put an ample covering of wool, and are then fixed firmly, but not tightly, with a bandage. This warm sodium sulphate pack should be changed two-hourly throughout the day and once or twice at night if the patient is awake. In the early stages of a carbuncle there is often much pain, and this must be controlled adequately with drugs, as sleep and rest are essential. If morphine is necessary it should be given. With this treatment nearly all carbuncles will remain local: pus and slough will be discharged, and healing will be as quick as, if not quicker than, if an excision had been made and scar tissue will be less. An anaesthetic is avoided; this is sometimes important, because carbuncular subjects are often unsuitable for anaesthetics. In a few cases, when the carbuncle seems deep and is very slow in starting to discharge, two clean crucial incisions may be made into it. These should not extend into the surrounding unaffected tissues. Following the incisions treatment with sodium sulphate packs should be continued, and the infected necrotic tissue will soon begin to come away freely. When this pack treatment is carried out, either with or without crucial incisions, the whole carbuncle gradually discharges itself, usually with the loss of some skin, and a clean granulating wound is left. The sodium sulphate dressings should be continued until all dead tissue has separated. Healing is now rapid, and a dressing of gauze covered with sterile vaseline is applied, being changed once in every three days. The scar that is left is much less conspicuous and ugly than when a complete excision of a carbuncle has been carried out.

Another and entirely different treatment which has met with a considerable measure of success in the last few years is by short-wave diathermy. Its disadvantage is that the necessary apparatus is not everywhere available. The carbuncle is covered with a layer of gauze, and one of the electrodes from the diathermy machine is put over this but is separated from it by a layer of felt. If the carbuncle is on the back of the neck the other electrode is put either on the forehead or on the front of the neck. When the current is turned on the patient gets a comfortable feeling of warmth in the neck; this treatment is continued for ten to fifteen minutes. Great relief is often experienced even after the first application, the effect of which seems to be to make the carbuncle clear up more quickly. The diathermy should be given daily until the discharge of dead tissue occurs freely. During the days when this treatment is being given, and afterwards, the sodium sulphate packs may be put on with advantage.

Facial Carbuncles

These require special mention owing to their very grave prognosis. Carbuncles on the face are likely to be followed by cavernous sinus thrombosis (an invariably fatal condition), particularly if they are squeezed or scraped or cut. Even a small facial carbuncle must be treated seriously from the beginning and the patient put to bed.

The lesion should be touched and handled as little as possible: that part of the face on which it is situated should be immobilized by covering a wide area around it with elastoplast, the carbuncle itself being left exposed. Further, to obviate movement of the part the patient should not be allowed to talk, and only fluids should be given. If the carbuncle is near the lips all drinking should be through a straw. It should be bathed every two hours with hot 12 per cent. sodium sulphate solution for half an hour at a time. This is best carried out by holding the face over a basin of the very hot solution and keeping the part really hot by holding a large pad of absorbent cotton-wool, soaked in the solution, gently against the carbuncle for a minute or two at a time.

On no account must any incision be made into a carbuncle on the face, and all hands wanting to squeeze it must be held back. All sloughs should be allowed to separate by themselves, or at the most should be gently bathed away. Incisions into or excision of facial carbuncles are likely, even if they do not cause cavernous sinus thrombosis, to leave unsightly scars, and such deformities as ectropion or a distorted mouth.

Spreading Carbuncles

Certain carbuncles do not remain localized but continue to spread, sometimes at an alarming rate. This as a rule occurs in patients who are especially debilitated either from diabetes or some other cause. When adequate general measures and the local treatments described above are carried out a carbuncle usually soon ceases to spread; but if this is not the case further steps may be required. There are two alternatives—either injection of blood into the surrounding tissues or excision of the carbuncle. The former is less drastic; but although it may not be quite as effective it is worth trying. About half a cubic centimetre of a strong solution of sodium citrate (25 per cent.) is drawn into a 20-c.cm. syringe, which is then filled with blood from the patient's vein. This is injected at a number of points of puncture about an inch apart around the carbuncle, outside the indurated area. About 5 c.cm. are injected at each place, deep down near the core of the lesion. Fifty or sixty cubic centimetres of blood may be required in all.

If the injection of blood does not stop the carbuncle spreading, the latter should be excised. Ideally the whole carbuncle should be excised, but in the case of a very large one, when only one edge is spreading, it may be sufficient to excise that part alone, as excision of the whole lesion is such a severe operation. When a carbuncle is excised healthy tissues just beyond the edge should be cut through and the incision carried deep enough to get underneath the carbuncle, removing all infected tissue. After excision the wound is packed with gauze wrung out of flavine (1 in 1,000), so as to control the bleeding.

Carbuncle in Diabetics

Carbuncles have a worse prognosis when they occur in diabetics. It should be remembered that in some cases a carbuncle may have an accompanying glycosuria which is not due to true diabetes. It is essential to get the diabetes under control as soon as possible, and to this end it is advisable to obtain the help of an expert in this disease, as in the presence of severe infections diabetes may be very difficult to control with insulin. In diabetics, owing to the grave prognosis and their poor powers of resisting infection, it is usually inadvisable to try conservative treatment with sodium sulphate packs, for if time is wasted the case may easily and quickly get out of

SURGICAL PROCEDURES IN GENERAL PRACTICE

This is one of a series of articles contributed by invitation

TREATMENT OF BOILS AND CARBUNCLES

BY

JOHN HOSFORD, M.S., F.R.C.S.

Both boils and carbuncles are localized staphylococcal lesions involving the skin and subcutaneous tissues. A septicaemia is very uncommon, though a toxæmia is often seen, and in a consideration of the treatment not only must the local lesion be attended to but so must the general condition of the patient.

Boils

A boil often arises as the result of some irritating pressure on an unclean skin area in a person who, for some reason, is run down. The back of the neck is the commonest site, and the collar frequently has some aetiological importance. The treatment of an early boil in this position or elsewhere consists in removing the irritating pressure—such as from collar or braces—and covering the boil with two or three layers of elastoplast. The latter acts by protecting the boil from being rubbed and, what is more important, by splinting the inflamed area. Complete rest to an inflamed area is one of the elementary principles of therapy, but in the case of minor inflammatory lesions it is often forgotten. Collodion painted on to a boil and allowed to harden has been recommended, but it is not as good a splint as elastoplast. A circular piece of elastoplast a little larger than the boil is cut: in an average case this will be the size of a halfpenny, and it is stretched out and stuck on so that it covers the whole boil. A circle of elastoplast the size of a penny is then put on over this. A striking and immediate reduction in the pain follows, and in many cases the swelling quickly subsides and the boil disappears in an almost miraculous manner. If the boil begins to discharge a piece of elastoplast with a small hole in its centre, through which the pus may escape, is substituted for the first piece: this may be changed as it gets soiled. Thus treated the boil is likely to clear up and heal without leaving a scar.

With larger boils a decision has to be made as to whether operation is necessary and, if so, when it should be done. In the case of even a large boil early intervention is not advised. The contents are not so much pus as a core, or slough, which is a portion of dead tissue. Until the slough has separated operation should not be carried out, as the main object of operation is to remove the core and not to evacuate pus. The right moment for this is a matter of judgment, and until operation is necessary the best treatment for a large boil is to splint a wide area around it with several layers of elastoplast, leaving the whole boil exposed in the centre. This is covered with a thick layer of magnesium sulphate paste, over which are put several layers of gauze, wool, and a bandage. With this treatment a boil which at first may seem to require operation may recover without it. The magnesium sulphate paste has the following formula:

Exsiccated magnesium sulphate ...	2 parts
Glycerin (by weight) ...	1 part

It is much more efficacious when freshly prepared. When the paste is first applied it is rather painful, and it will be necessary to prescribe aspirin, veganin, or other suitable drugs for relief. When a boil requires operation a crucial incision under an anaesthetic (preferably gas or evipan) is made and the slough picked out with a pair of forceps. The edges of skin need not be cut away, and the tissues should not on any account be curetted or scraped. If the core is removed there is an almost immediate relief of pain, and healing is rapid and leaves very little scar.

Fomentations are rarely indicated, and are usually undesirable: if they are employed crops of small boils and pustules are likely to arise in the surrounding skin. If as the result of injudicious treatment or for any other reason fomentations seem to be indicated, the skin around the boil should be carefully but gently cleansed with ether and covered with ung. hydrarg. nit. dil. These precautions will prevent infection with staphylococci, and thus avoid further boils and pustules.

In cases of multiple boils, in addition to the treatment already outlined, local and general ultra-violet light may sometimes be used with advantage. It is important that the patient should have not only physical but also mental rest. It is striking how often a number of boils appear when a patient is worried or mentally overworked. The taking of yeast and various vitamins has been recommended, and injections of colloidal manganese and other substances have their advocates, but the exact value of these measures is doubtful. Vaccines, autogenous if possible, may be used; but here again their value is doubtful, and the best and often the only way to get a crop of boils to disappear is to enforce absolute rest, a complete change of air, and scrupulous though not vigorous cleansing of the affected parts.

Carbuncles

Carbuncles have many points in common with boils, but they are, of course, much more dangerous. A facial carbuncle is a most serious lesion, and if not carefully treated is likely to prove fatal as the result of infection travelling by way of the facial vein or pterygoid plexus and causing cavernous sinus thrombosis.

A great variety of treatments have been employed for carbuncles, but the general tendency in recent years has been towards conservatism. In the past, and in the hands of some surgeons still, excision of the whole carbuncle is the method of choice, but this is not advised. Except in the case of small carbuncles, the patient should be put to bed, encouraged to drink increased quantities of fluid, and the bowels should be made to act regularly (though overpurging is to be avoided). It is important, particularly with underfed patients, that they should eat an adequate amount of nourishing food, and to aid this bitters or alcohol may be necessary. It is essential in all cases of carbuncle to test the urine, particularly for sugar. Diabetics are more likely to suffer badly with carbuncles: when they have any inflammatory condition the amount of glycosuria is likely to be increased, and until this is properly attended to by diet and insulin recovery of the carbuncle will be delayed. The use of

Nova et Vetera

BARTHOLOMEW CLOSE, NEWBURY

In 1925 Dr. Walter Essex Wynter, F.R.C.P., F.R.C.S., then not long retired from the position of senior physician to the Middlesex Hospital, London, began to carry out a project for adapting certain properties which he had purchased on the outskirts of Newbury, Berkshire, as a hostel for retired sisters and nurses of the Middlesex Hospital. Occupation began in 1926, when two cottages built in 1618 and situated just to the north of Dr. Wynter's own house (Bartholomew Manor) were converted unaltered, and two new ones were built just round the corner in Pound Street, adjoining the two old ones already mentioned.

An Ancient Manor

The history of this ancient manor is of considerable interest. Before the Norman Conquest it was held from

the Crown by Ulward the Saxon, and was known as Ulvritone. Nothing more is heard of Ulward, who was quite possibly killed at Senlac; at any rate, his manor was granted by William I to Ernulph de Hesdin, the latter a village in Picardy well known to many of our troops in the Great War. The next holder whose name is recorded was the Earl of Perche, and it was later possessed by the Earl of Pembroke, the

Earl Marshal who sided with Matilda against Stephen. This nobleman quarrelled with the Church, and was solemnly cursed; he had five sons who inherited the manor in turn; but all died childless, or at least without male heirs. The Earl is commemorated in the name of Hamstead Marshal, some three or four miles away, where he had one of his strongholds. By 1394 the manor was held by Richard FitzAlan, Earl of Arundel, who was beheaded; and it was subsequently held by the Earl de Bohun and then by Roger and Edmund Mortimer. It passed eventually to Edward IV, whose grandmother was a Mortimer, and was in the next century held by Jane Seymour, her son Edward VI, and the succeeding sovereigns down to Charles I, who granted it to the town of Newbury. Before these royal ownerships a large part of the demesne—about 140 acres—had been given to Sandford Priory, near Newbury; and when this Priory was dissolved in 1478 the land was handed over to St. George's Chapel, Windsor, whence it was transferred in 1888 to the Ecclesiastical Commissioners.

Reconstructions

The present manor house, which Dr. Wynter inhabits, was built about 1350, and it still contains much of the original oak timber used in its construction. At some remote date the roof has been raised, and one of the jack rafters has been formed out of an unglazed windowhead:

this reconstruction was therefore undertaken probably not later, or not much later, than 1480, and possibly much earlier. In the year 1550 it would seem that the ground floor of the house was in use for the accommodation of farm animals—horses or cattle—for in that year J. H. Winchcombe, son of Jack o' Newbury, altered it to incorporate the ground floor into the dwelling house as it now exists. To house the dispossessed animals he built quite near it, on the south side, a range of buildings—cart shed, stables, and so forth—which by 1670 had come into the possession of Philip Jemmett, an official of the Brewers' Company, who erected the arms of the Company over the porch, where they still are. He divided the building into cubicles and put in chimneys, converting the whole structure into somewhat primitive almshouses. His grandson, Jemmett Raymond, added a new block of almshouses at the opposite side of Argyle Road, which remain in use and in good preservation and are highly picturesque. They are still called Raymond's Buildings. Jemmett's almshouses were not nearly so attractive, though of course much older; and when Dr. Wynter came into possession of them he decided that the low-pitched attic floors were unfit, in their then state, for

his purposes. So he took off the roof, raised this story three feet, and then replaced the roof; he also put in more windows. He thus created eight cottages, or more strictly maisonnettes, each providing one sitting room, one bedroom, a kitchen, and a bathroom. They were completed in 1929; three of them have the original staircases still intact.

Wooden Links with Eton

The interior doors of these cottages are made of extremely ancient oak, whose history is worth recounting. About 1840 (or soon after) the authorities of Eton College saw fit to order the removal of the antique shutters from the oldest buildings, which date from the foundation of the College by Henry VI. As these shutters were designed for unglazed windows they were probably made at the same time as the buildings were erected. The builder who carried out this "improvement" retained them in his yard for a number of years and then sold them to a dealer. A medical man later still bought them at Witney for eighteenpence each, intending to use them for some purpose which he then had in mind; but after storing them for many years he found that he no longer required them, and gave them to Dr. Wynter. These shutters, which have the original hinges on them, Dr. Wynter has used for the interior doors of this particular group of his cottages. They are carved all over with the names of old Etonians, many of them members of well-known Etonian families; some of these inscriptions are dated, the earliest 1593 and the latest 1840—the eighteenth century is particularly well represented.

A Harmonious Scheme

During these reconstructions and alterations Dr. Wynter has steadily refused to use modern bricks and timbers: he buys materials of Elizabethan date, or earlier, when

hand. Instead, complete excision should be carried out while the carbuncle is still small. If this is done and the diabetes is got under control immediately, the result is satisfactory, but no time must be lost.

Complications of Carbuncles

One cannot leave the subject of treatment of carbuncles without a brief reference to certain complications. Enough has been said about cavernous sinus thrombosis in connexion with carbuncles on the face, and how it is to be avoided. Nothing can be done once the condition is established.

Septicaemia and pyaemia sometimes occur, and may be the cause of a persistent pyrexia when the carbuncle itself appears to be progressing satisfactorily. In some cases the carbuncle may be practically healed, when the temperature rises and there are signs of infection in some other part of the body. A place where this is likely to occur is in the perinephric tissues. An abscess may form here and be easily overlooked as the symptoms are not pronounced, and unless the loin is palpated the condition may not be recognized for several days. Such an abscess, if adequately opened, will heal without leaving any ill effects on the kidney. In one case a very severe metastatic mediastinitis came on when a carbuncle on the neck was quite quiet and almost healed.

VITAL BALANCE-SHEET OF 1935

REGISTRAR-GENERAL'S REVIEW

The text volume of the Registrar-General's Statistical Review of England and Wales for 1935¹ contains the official commentary on the two volumes of vital statistics already published—namely, Tables Part I Medical and Tables Part II Civil. The report deals with the statistics of births, deaths, and marriages registered in 1935, the estimates of population, registrations under the Legitimacy Act and the Adoption of Children Act, and with the numbers of parliamentary and local government electors.

Population Figures

The estimate of the population of England and Wales in the middle of 1935 was 40,645,000 persons, of whom 19,500,000 were males and 21,145,000 females. The total is 178,000, or 0.44 per cent., greater than the estimate for the previous year and 693,000, or 1.7 per cent., greater than the population at the Census of 1931. The figure of 693,000 is made up of the excess of births over deaths, about 493,000, and the balance of migration, 200,000. The average ages of the estimated population are 32.7 years for males and 34.5 for females. These are gradually increasing; in 1931 they were 31.8 and 33.5 respectively, and in 1921 29.9 and 31.2. The marriages registered during 1935 were 349,536 in number.

The live births registered in 1935 were 598,756, or 1,114 more than in 1934. The corresponding birth rate was 14.7 per 1,000 population. A comparison with the rates in many other countries shows that only three of them—Austria, Norway, and Sweden—had lower rates. The number of male births exceeded the number of female births in the ratio of 1,056 to 1,000. The ratio is very inconstant, and may be low in one year and high in another in the same region. Stillbirths formed 4.1 per cent. of the total births registered. The natural increase of population in 1935—that is, the excess of live births over deaths—was 121,355, as compared with 120,832 in 1934 and 83,948 in 1933. The rate is 3 per 1,000 population.

¹ H.M. Stationery Office, price 3s.

Analysis of Deaths

The report reviews the mortality from various causes during 1935, and also contains several special studies.

Infant Mortality.—Comparison of the rates in 1931–5 with those in 1921–5 showed a decline during the ten years ranging from about 5 per cent. for infants under 1 month to 30 per cent. for infants aged 6 to 12 months. Comparing the group of towns whose infant mortality rates in 1935 were 90 per 1,000 live births or over (Bootle, Gateshead, St. Helens, Sunderland, Wigan) with the group of towns with rates below 40 (Bath, Eastbourne, Exeter, Great Yarmouth, Ipswich, Oxford), the causes of death responsible for most of the excess were measles, whooping-cough, bronchitis, pneumonia, and diarrhoea.

Tuberculosis.—A study of the decline in tuberculosis mortality since 1851 shows that the mortality of children under 5 from this cause has fallen to about one-ninth of the level of 1851–60, and of children aged 5 to 15 to less than one-fifth. At ages 15 to 25 mortality of men has fallen to one-quarter and of women to less than one-third, and rates at higher ages have declined to less than one-third of their values in 1851–60. The standardized death rate from respiratory tuberculosis was 28 per cent. lower, and from other forms of tuberculosis about 40 per cent. lower, for each sex in 1935 than the average rates for 1921–30. Among English rural areas those of Durham had the highest tuberculosis rates for young adult males and those of Herefordshire had the highest phthisis rate for young adult females, but several of the Welsh counties, notably Caernarvonshire, gave rates in excess of any English county.

Cancer mortality at various ages is compared in 1911–20, 1921–30, and 1931–5, and it is pointed out that the recorded mortality from cancer of some parts of the body has continued to increase since 1921–30 at advanced ages although it has become stationary or begun to decline in middle age, and it seems necessary to conclude that the average age of appearance of cancer in some of these organs is becoming later. For a few organs, on the other hand, cancer mortality continues to increase at almost every age.

Maternal Deaths.—As a result of special inquiries during 1935 the relation of maternal deaths to the number of previous confinements, or to the occurrence of a twin or stillbirth or abortion, is shown, and the distribution of abortion deaths in each region during 1926–35 is also given.

Deaths from Poisoning and Violence.—Classification of the deaths since 1924 due to poisoning shows that in 1933–5, although the suicide rate by the use of solid and liquid poisons had almost ceased to rise, the resort to coal gas for this purpose was still increasing rapidly. Among the poisons which showed important increases since 1930–2 as suicidal agents were the barbiturate drugs, aspirin, and opium derivatives, while the slight increase in accidental deaths from solid and liquid poisons in the same period was more than accounted for by deaths due to barbiturates. In 1935 the cause principally responsible for the excess of mortality among males resident in rural areas over those resident in cities was road transport, other contributory causes being accidents in mines or quarries or by drowning. Female mortality caused by road transport was, in contrast with males, greatest for residents in Greater London. Analysis of the total mortality in 1935 by violence, other than suicide, shows that for children under 5 the advantage of a greater freedom from fatal accident which was enjoyed by the rural child in 1911–20 has almost disappeared, and at the school ages it has been replaced by a greater mortality risk in the rural districts than in the towns. At ages 25 to 55 the female risk, which in 1911–20 was greatest for town dwellers, has become greatest for residents in rural districts, but after 55 a reversal to a large excess of risk for town dwellers occurs. For males the greater risk to rural dwellers persists up to 65 before the reversal takes place.

Work at the Well

The report goes on to describe the well, which was constructed in 1888 and extends to a total depth of 205 feet. The object of the work on the well was to control the inflow into it so as to enable repairs to the pumping plant to be carried out. To keep down the water level while work was being carried out both of the two available pumps had to be used. With the two pumps at work it was not possible to pass the whole output through the filters. Before July, 1936, a chlorinating apparatus was available in the filter house, although it was only used at intervals: an ammoniator was added at that date as a result of unsatisfactory samples. Between September 24 and October 15, 1937, the water was pumped to waste while work was in progress and to supply during the remaining time. From October 16 till November 3 it was pumped continuously to supply. Neither the filter nor the chlorinating apparatus was in use during this period.

The men, eighteen in all, worked in two shifts of four hours. They were let down and drawn up from the well in couples in what is termed a "skip"—"a foreshortened barrel," in which chalk excavated from the adit to the well in which the men were working was also hoisted to the surface.

The provision for workmen requiring to relieve themselves while in the adit was this. An ordinary stable bucket was let down and kept in the adit. When, according to the evidence, it became half-full it was placed on, and bedded into, one of the loads of chalk going to the surface. This, of course, involved the skip being drawn into the adit from the main shaft: the chalk and bucket being placed in it: and its being released (though it may be with care) into the main shaft prior to being pulled up to the surface. The actual work the men were doing was lighted by hurricane lamps. In what part of the adit the bucket was kept did not clearly appear. I am satisfied that the men were warned that if their bowels were moved they should come to the surface, where there was adequate lavatory accommodation. I am also satisfied that in this long dark gallery where water was flowing there were ample opportunities, if a man were so minded, for the deposit of faeces and that there can have been no desire to multiply the daily journeys, up and down, in the skip. The typhoid carrier to whom I have already referred and who was, by common consent, described at the Inquiry as "Case A," worked in the well with certain recurring intervals from September 28 to October 26. It should be said of him at once that he was a man who had served in the war, had contracted typhoid in the war, and, through no fault of his own and in ignorance of the fact himself, remained a carrier of the bacillus.

From the evidence he had heard (Mr. Murphy's report continues) from eminent medical witnesses the period of incubation in water-borne epidemics was not likely to be less than fourteen days, twenty-one days would be fairly common, and the incubation period might be even longer. Whatever period was taken, the dates of the onset of symptoms pointed to the original infection having taken place while the work was proceeding in the well and while the carrier was there.

Dealing with other possible sources of infection, the report draws attention to the state of the area from which the Addington well derives its water. It is chalk soil covered above a certain elevation by a more or less permeable clay-with-flints. It is recognized that owing to wide fissures in the chalk water may flow through it almost completely unfiltered. The gathering ground of the Addington well has an area of not less than three and a half square miles, and in this area two possible sources of infection were inspected—namely, a farm known as Fisher's Farm and the site of a latrine used by workmen while building a school closely adjoining the well itself. Both these possible dangers have now been removed. A careful investigation into the medical history of those occupying houses and farms in the gathering ground showed that for a considerable time no case

of typhoid had been notified or known in the area. "In these circumstances I think it is safe to conclude that though the gathering ground undoubtedly contained potential sources of danger the actual infection of the well was not derived from it."

Departmental Incoordination

The facts having been stated, the report makes certain observations on them. Mr. Murphy points out that it was possible to shut off the supply from the well while work was taking place, which has actually been done since November 4, 1937. He continues:

There was both misunderstanding and lack of communication between the responsible officers of the Corporation in connexion with the work. Dr. Holden, the Medical Officer of Health, was never informed that the work was being carried out at all. He was in complete ignorance of it until after the outbreak had taken place. It is true that Dr. Holden's duties did not include any direct responsibilities with regard to water, but he was sent monthly analyses of the water taken from certain of the wells and reservoirs. He had frequently made careful comments upon these analyses and had advised on the question of chlorination. I cannot help thinking that if Dr. Holden had been informed that men were working in the well and that simultaneously filtration and chlorination had ceased his advice would have been sufficient to put an end to such a state of affairs. His ignorance of the fact that chlorination had ceased may seem the less surprising when I go on to say that Mr. Boast, the Borough Engineer, who was the person directly responsible for the water supply, was also in ignorance of it. At a meeting preliminary to the work being commenced between Mr. Boast, Mr. Brandram-Jones, the assistant water engineer, and Mr. Ellis, the mechanical engineering foreman in the Waterworks Department, it was brought home to Mr. Boast's mind that the proposed work would involve by-passing to a considerable extent the filtration plant. I am not satisfied that he then understood that it would involve a total by-passing of the filtration plant even when the water was being pumped to supply. He certainly never understood that it would involve elimination of the chlorinating plant. It was common ground between all three witnesses as to this interview that no mention of the chlorinating plant was made at all. This seems very surprising, for the filtration plant used as it was without a coagulant did little more than remove turbidity. The chlorinator, on the other hand, was worked with an ammoniator, and even with the very small dosage that was being adopted, and without the stepping up of that dosage which took place from time to time when the analyses seemed unsatisfactory, might conceivably have been effective to deal at least with the typhoid bacillus. Evidence was given that the typhoid bacillus is killed by a smaller dose than that necessary for the destruction of the colon bacillus. It would seem that Mr. Brandram-Jones overestimated the value of the filtration plant and underestimated that of the chlorinator. He attributed virtues to the filtration plant which it did not possess, and regarded (with some reason) the very small dosage applied to the chlorinator as one merely intended to keep it, so to speak, ticking over, so that it should be ready for stepping up from time to time when it was required. He therefore mentioned the cutting out of the filtration plant, but omitted to point out that this involved as a necessary consequence the cutting out of the chlorinator. Mr. Boast was not sufficiently acquainted with the layout of the pipes to be aware that the one proceeding followed the other. On October 31, 1937, after the outbreak had definitely begun, he inquired on the telephone from Mr. Brandram-Jones (who had left Croydon on October 16 to take up a post elsewhere) what orders he had left as to chlorination at the Russell Hill reservoir and Addington well, and learned for the first time that the latter was not being chlorinated at all, and had not been chlorinated for a considerable time. What is extremely difficult to understand is how (even in the absence of any communication with the Medical Officer of Health) it occurred to none of these gentlemen that the fact of men working in the well during a period when water was being pumped to supply afforded strong grounds for the stepping up of the dosage of chlorination in contrast to its elimination. If Mr. Boast had mentioned the desirability of increasing the dosage of chlorine he would at once have been informed that the by-passing of the filters involved the by-passing of the chlorinator. If it had occurred to Mr. Brandram-Jones, who regarded the existing dosage as merely nominal, that an

buildings of that age are demolished, and his restorations and additions are all designed to harmonize with the old buildings. In fact, it is not easy to tell, when looking at an addition to a piece of the old property, where the old work ends and the new work begins. The only finds of any antiquarian interest during the progress of the different works have been an Elizabethan sixpence and a Charles II farthing of 1670—the latter reign was the first in which farthings were minted, so that this represents a very early issue indeed. Four more adjacent cottages, thought to be about two hundred years old, were also purchased by Dr. Wynter, and are in occupation. On the completion of the adaptation of Jemmett's almshouses and their occupation by eight nurses Dr. Wynter projected additional buildings on a site in close vicinity to them to provide quarters for eight more. Here again the planning was carried out in close conformity with the old buildings; and once more care was taken to use none but materials of Tudor date, or older. Four of these cottages are now complete, and were thrown open for occupation in the early part of 1937. Four more are contemplated to round off the scheme, raising the total to twenty-four. It is perhaps hardly necessary to say that Dr. Wynter provides this accommodation entirely free: his tenants pay neither rent nor rates.

The merits of this scheme of practical philanthropy need scarcely be laboured here: they stand out without need of adjectives or superlatives, and were generously acknowledged in the nursing papers in 1926 and 1927 when the first parts of it fructified. When Dr. Wynter communicated to the Governors of Middlesex Hospital the details of his plans, and the announcement of his intention to bequeath to the hospital the completed homes and to provide an endowment for them, to be kept in perpetuity for retired members of the nursing staff, the daily press also contained appreciative articles. At that time the plans were, if not in their infancy, at any rate very far removed from completion; and now that the design is well on the way to entire fulfilment it is possible to realize more fully what a blessing the enterprise will prove to the nursing profession, with which Dr. Wynter was closely and happily associated during the many years of his services to the Middlesex Hospital, to which he is consulting physician. Dr. Wynter entered the school there in 1878 as a scholar, and finally severed his active connexion with it in 1925, on retiring from the post of senior physician. He served for a long period on the Council of Epsom College, at which he was educated, and has been for many years past a member of the Newbury Borough Council.

The illustration shows a view of Jemmett's almshouses—now named Bartholomew Close—as reconstructed, with Dr. Wynter's house, Bartholomew Manor, beyond them; it is from a drawing by Mr. A. J. Campbell Cooper, reproduced in the *Newbury Weekly News* of August 16, 1934.

Practical recommendations which should lead to eradicating discoloration and corrosion in canned cream are put forward in a recent publication of the International Tin Research and Development Council. The work was undertaken by C. J. Jackson and G. R. Howat of the Hannah Dairy Research Institute, and T. P. Hoar of the council. The defects studied are the occurrence of purpling, bronzing, and pitting of the can and black particles in the cream, and an explanation of them is now provided. The practical implications of this and a previous paper on the same subject relate to the quality of the milk used for cream manufacture, the quality of the tinplate used for the cans, the kind and amount of stabilizer used, and the conditions of processing and storage. The details are given in *Technical Publications*, Series A, Nos. 49 and 72, of the International Tin Research and Development Council. Copies may be obtained free of charge from Manfield House, 378, Strand, W.C.2.

THE CROYDON TYPHOID INQUIRY

MR. H. L. MURPHY'S REPORT

On November 22, 1937, Mr. Harold L. Murphy, K.C., was appointed by the Minister of Health to hold a local inquiry into the causes leading up to the outbreak of typhoid fever in the County Borough of Croydon during October and November, and the steps taken to deal with that outbreak. Sir Humphry Rolleston, Bt., M.D., and Mr. H. J. F. Gourley, M.Inst.C.E., were appointed to sit with Mr. Murphy at the same inquiry as assessors. The public sittings of the tribunal were reported week by week in these columns.¹ The report of the Inquiry, dated February 8 and signed by Mr. Murphy, was published on February 14 as a White Paper;² it is a printed document of seventeen pages.

Main Conclusion

Mr. Murphy's main conclusion is set out on the first page as follows:

The immediate cause of the outbreak was a portion of the public water supply becoming infected by the typhoid bacillus. The infected portion was that derived from a chalk well at Addington. How that well became infected is a question that cannot be answered with absolute certainty, but all the circumstances and probabilities point so strongly in one direction that I feel justified in coming to a definite conclusion on the subject. That conclusion is that the well was infected by the fact that at the end of September and during October, 1937, men, one of whom was an active carrier of typhoid, were working in the well, and that during large parts of such period water from the well, unfiltered and unchlorinated, was being pumped to supply.

At the end of the report he says: "The infection was due to an unfortunate and rare coincidence of three factors—(a) constructive changes taking place in the well, (b) one of the workmen being a typhoid carrier, and (c) the process of chlorination being in abeyance."

Croydon Water

The Borough of Croydon mainly depends for its water supply on five wells, two of which, Addington and Stroud Green, supply what is called the high level area. The Addington well contributes 1,000,000 gallons to the normal yield of the Corporation wells of 6,066,000 gallons a day. The wells are situated in the Upper Chalk. Among the storage reservoirs supplied from them is one at Addington which represents the high level storage and which, though receiving some water from the Stroud Green well, was at the time primarily filled from the Addington well. It was estimated during the Inquiry that the population "at risk" on the high level supply was between 36,000 and 40,000 out of approximately 250,000 persons in the borough. With the exception of a few isolated cases all the primary cases of typhoid in the outbreak were within the area of the high level supply; in the few isolated cases the patients had opportunities of drinking high level supply water.

After a number of cases had been notified and it was apparent that the high level supply water might be implicated, samples of water from the Addington well and the Stroud Green well were submitted on November 3, 1937, for examination by the Ministry of Health bacteriologist. On the following day the test showed that the Stroud Green water was satisfactory, but that the water from the Addington well was heavily polluted, although the typhoid bacillus could not be isolated. On the same day (that is, November 4) the supply from the Addington well was cut off, and it seems certain that no primary case was infected after then. It is probable that there was no primary infection after November 1, when chlorination was applied to the well.

and asked for the assistance of one of its medical staff. Dr. Ernest T. Conybeare of the Ministry arrived in Croydon on November 3 and attended daily at the Borough for some time. One of Dr. Conybeare's first inquiries was whether the residences from which cases had been reported were all on the same water supply. A map of the water system of the Borough produced by Mr. Boast made it "tolerably clear that the common vehicle of the infection was water from the high level supply." Consequently the samples were taken from the Stroud Green and Addington wells, the latter, as already stated, being found to be heavily polluted.

Water in House Cisterns

After November 4 the primary sources of infection had ceased to operate and it was only from water in mains and cisterns originally supplied from the Addington well that any further primary infection could possibly be derived. A plan showing the nineteen latest cases to be notified had revealed that most of the houses concerned had small storage capacity, varying from 17 to 26 gallons. The two houses with the largest storage, one of 71 and the other of 56 gallons, had no tap connected with the storage tank. No fewer than six out of the nineteen had no storage tank and depended entirely upon the main. It was concluded that polluted water in cisterns and storage tanks after November 4 played no part in the epidemic. Dr. Suckling on his arrival at Croydon on November 11 recommended that water stored in unoccupied houses should be run off and that people who might be returning to houses which had been unoccupied for some time and where there were cold water storage tanks should be advised to run off the stored water. "It seems to me," states Mr. Murphy in the report, "on the evidence that this is a very desirable precaution and should be recommended at the very earliest possible moment after the water supply is ascertained to be the probable source of infection."

Medical Co-operation

I come now to a matter of criticism which is to some extent general in relation to both of the periods which I have been considering. On November 1 Dr. Holden, by letter, notified all the registered medical practitioners in the Borough of the fact that certain typhoid cases had occurred in South Croydon. No details were given other than a general warning to keep the possibility of typhoid in their mind. It would be doing an injustice to the local medical practitioners to assume that, with this warning before them, they would not seriously consider the possibility of typhoid in any case of fever that they were called in to treat. That they would do so was stated in evidence which I accept, and indeed it seems obvious. On the other hand, there was uncontroverted evidence from the highest source before me that the clinical symptoms of typhoid vary in particular outbreaks and that the early symptoms can readily be mistaken for those attributable to other causes. The early manifestations sometimes seem to be not unlike those of influenza, and they can be, and have been, mistaken for those of appendicitis. In addition, the remarkable diminution of typhoid in this century has deprived medical practitioners of any common acquaintance with the disease. These facts seem to me strongly to enforce the view expressed by Sir William Willcox, who took the trouble of attending the Inquiry on January 6, 1938, to give the assistance of his valuable evidence, and to express the view that in all large areas there should be some committee representing all the local practitioners which, upon the occurrence of any outbreak, would be in constant and close touch with the Medical Officer of Health and would provide the means of pooling and distributing all the information available from time to time as to symptoms and possible causes. For instance, in the present case, it would have been of assistance to the general body of practitioners for the purposes of diagnosis to know, as soon as possible that water had been identified as the source of the disease. It is desirable to make two things clear. First, Sir William Willcox was not directing any special criticism at the Corporation's medical services for lack of some such committee as this. On the contrary he emphasized the fact that the absence of such a body was general throughout the country except in

very few cases. Secondly, nothing in the evidence of Sir William Willcox detracted from the fact that after the outbreak had taken place the sole responsibility for dealing with it rested with the Medical Officer of Health and that he could not at the time of such a crisis be expected to act as chairman of a committee. The view expressed by Sir William Willcox was a plea for some means of creating closer contact and more ready communication between the Medical Officer of Health and the general body of practitioners, and part of the value of the suggestion seems to me that it might tend rather to easing than increasing the work of the Medical Officer of Health during the course of an epidemic. I would observe, too, that a very large number of cases in this epidemic occurred on the very borders of the Borough, and that it was obviously desirable that contact and communication should be established between the Medical Officer of Health and a slightly larger number of doctors than those with addresses in the Borough Directory.

The M.O.H. for Croydon

In conclusion the report states that although there was severe criticism of Corporation officers during the Inquiry it had never been suggested that once a case of typhoid was reported it was not promptly, carefully, and skilfully dealt with. The main task of the medical officer of health throughout the epidemic was the provision of accommodation for the sufferers and "the treatment necessary to keep down the death roll as far as possible." The burden upon Dr. Holden in this respect was enormous, and nobody suggested that he did not discharge it adequately and well.

Counsel appearing on behalf of certain local medical bodies put forward, with considerable skill and moderation, an appeal for greater co-ordination between the Medical Health Department and general practitioners, but expressing the views of his clients, described Dr. Holden as "a loyal, able, and industrious servant of the Corporation as well as a truthful and careful witness." With that expression of opinion I concur. It appears to me that the only legitimate criticism that can be directed at Dr. Holden in this case is a slight delay in his realization that "water" was or might be the cause of the epidemic. I do not think that until after October 29 he had any reason for directing his mind to water. The two cases notified up to that date, like the earlier case on October 20, might well have been regarded as sporadic. On October 30 he had two more notifications and the indication of two further cases, making six in all. I think by then his mind might well have turned to water, but it is clear from the evidence as to what took place on October 31 that he remained until then reluctant to consider water as a probability. As I have already said, it was on the morning of November 1 that effective chlorination took place at the Addington well, although Dr. Holden admitted that this was done as a precaution and not because the well was then suspected. From these facts it will be obvious that any criticism of delay in attacking the Addington well supply must be based upon a period not exceeding two days, and I must repeat that Dr. Holden until October 31 was ignorant of the fact that chlorination had ceased at the well. If separate samples of the well water were taken on October 30, as they were in fact on November 3, the result would have been known at the earliest on October 31, and could at best have meant the speeding up of chlorination by some hours. The dates of the various cases render it unlikely that any infection was caused by this short delay, and if I had to come to a conclusion upon the matter I should say that it was not.

Mr. Murphy ends his report by saying that while the responsibility for the conclusions and the grounds for stating them are entirely his own, his assessors, to whom he pays tribute for their invaluable, painstaking, and loyal assistance, are in general agreement with them.

To the *Revue Médicale de la Suisse Romande* of December 25, 1937. A. Guisan contributes an interesting account of Charles Augustin Sainte-Beuve (1804-69), who, abandoning medicine for literature, one hundred years ago gave his first course of lectures at the University of Lausanne. The paper refers to his last illness and gives the post-mortem findings.

increase in the dosage of chlorination was desirable while the work was proceeding, he would, of course, have been the first to point out to Mr. Boast that the work was involving the total cessation of chlorination.

"In this surprising and regrettable state of affairs," the report continues, "the work commenced." Mr. Murphy did not accept that the men chosen for the work had been carefully selected for physical fitness out of a large number of volunteers. "The important point is that there was no examination at all, however cursory, by the only class of person who would have been qualified to express any opinion of value upon the subject—namely, a member of the medical profession." He continues:

I should observe, since I have dealt with the arrangement for urination while the men were working in the well, that this appears to have been completely unknown to Mr. Boast, although it would also appear that it had been the practice in Croydon during such work for many years.

Mr. Boast was under the impression that he had given directions to the effect that the men, whether they required to defecate or urinate, should be brought to the surface. If he did so (which was a matter of dispute) it would seem that his words were "use the lavatory," which might not have conveyed the meaning he intended to those, like Mr. Brandram-Jones and Mr. Ellis, acquainted with the practice of bringing men to the surface for the one purpose and not the other. I do not attach overmuch importance to this, for I think that there was much force in an observation made by Mr. Ellis that if there was insistence upon the men coming to the surface whenever they desired to urinate and no provision made for that purpose where the work was being carried on the danger of misconduct would be greatly increased. This is quite a different matter from the question whether the provision for urination in the well gave any guarantee of safety. In my opinion it did not. The most elementary care would seem to dictate at least the use of a vessel which could be closed before being thrust out into the well shaft and hauled to the surface. This is, perhaps, an appropriate point to refer to the fact that Case A was definitely ascertained to be a faecal carrier and that a number of tests failed to detect any trace of the bacillus in his urine. There is the less materiality in this, since the scientific evidence established that a very large proportion, probably more than one-half, of faecal carriers are, at least intermittently, urinary carriers, and that, as the detection of the bacillus in the urine is a more difficult matter than in the faeces, a negative result from even a large number of tests is not conclusive. While I have stated at the outset that all the probabilities point to the source of the infection of the well as being the work that took place in September and October, 1937, treating the gathering ground as a potential, but in this case improbable, source of infection, I am bound to say that singularly little attention appears to have been paid by the water department to that potential source prior to the outbreak.

It was regrettable that a contractor's workmen engaged on Corporation work were allowed to dig and use a latrine almost directly above one of the well adits, and also unfortunate that the privies of Fisher's Farm which drained only into the soil and with an obvious tendency to flow down through the chalk in the direction of the not distant well should have been ignored. "I should say at once," Mr. Murphy goes on to say, "that Mr. Boast's duties as borough engineer covered so wide a range of matters as to make it impossible for him to give detailed personal attention to the highly important subject of water supply. He was responsible for highways, lighting, drainage, housing, and many other matters. It may well be a matter for consideration whether in a borough of the dimensions of Croydon with its own water supply that supply should not be under the direction of a fully qualified water engineer reporting to a water committee and keeping in close touch with the medical officer of health."

Dealing with the Outbreak

In considering the steps taken to deal with the outbreak the report observes that on October 20 a case of typhoid was notified but had no connexion with the outbreak, as the patient had contracted the infection whilst on holiday in France. The first case in the outbreak was notified

on October 27, the second case on October 28, and two further cases on October 30, when the Medical Officer of Health received a letter from Mr. C. H. Rimington calling his attention to two further cases and stating, "with considerable prescience, that even in these early cases other possible causes could be eliminated and that 'the only common thing appears to be water.'" On October 31, a Sunday, a meeting of local ratepayers was organized by Mr. Rimington at which Dr. Holden and Mr. Boast were present. Mr. Murphy continues:

I have referred in connexion with the first subject-matter of the Inquiry to the odd lack of communication between the waterworks department and that of the Medical Officer of Health in connexion with what was being done at the Addington well. There is an equally surprising parallel in the opposite direction. Mr. Boast, the gentleman in sole control of the water undertaking, was unaware until October 31, when he received a telephone message to that effect from a private citizen, Mr. Rimington, that any cases of typhoid had occurred in the borough at all. This undoubtedly arose from Dr. Holden having formed the view that the possibility of water being the cause of the cases which had been notified was comparatively remote. There was some dispute as to what precise expression was used by Dr. Holden at the meeting on October 31 with regard to water being the cause of the infection. Dr. Holden's own statement as to what he may have said was "that I could not suspect water until I had eliminated other factors." There was a good deal of evidence from gentlemen present at the meeting that Dr. Holden used the word "inconceivable" in connexion with water as a possible cause, but Dr. Holden's own recollection as to what he may have said is quite sufficient to show the tendency of his mind at the time. There are a number of explanations of this. He had had the sporadic case on October 20; since then he had had only four notifications apart from the two mentioned in Mr. Rimington's letter. He was in complete ignorance, through no fault of his own, of the work that had been carried out in the Addington well and of the fact that chlorination there had stopped. There was nothing at the time to make him visualize the extent of the coming epidemic, although there was sufficient to make him uneasy. Sporadic cases of typhoid, though happily increasingly rare, are still common in the experience of a medical officer of health whose area comprises a population of a quarter of a million. Up to July, 1937, from the beginning of the year, there had been ten notifications of enteric fever in the borough, nine of which were cases of paratyphoid, the less virulent form of the disease which is very commonly derived from articles of food contaminated by a carrier. Dr. Holden had, no doubt, in his mind the last substantial outbreak of typhoid in the country, which was, in fact, found to be caused by milk, albeit the primary cause was the infection of the milk by water, though not from a public water supply. At the same time I think it is proper to point out that Dr. Holden was under the impression that water was comparatively rare as a cause of recent outbreaks of typhoid. That impression was wrong. I had the advantage of hearing the evidence of Dr. Suckling, an expert of very great qualifications and outstanding as an authority upon water supplies. He is the joint author of the standard work upon the subject which was freely used and referred to by all parties at the Inquiry. Dr. Suckling's opinion, expressed in his own words, was "I think that water occupies the pre-eminent position with regard to the spread of typhoid fever" and again "my view is that the majority of the epidemics of typhoid fever have been due to the infection of water rather than food." It is obvious that when typhoid occurs all possible sources of infection should be tested as soon as possible. It would seem, however, on the evidence I have heard, that even before it is possible to draw a line between the sporadic and the epidemical, water should be immediately suspected, and if there is any priority in the course of examination for possible causes it should be given to water.

It was on October 31 that Mr. Boast learnt from Mr. Brandram-Jones that chlorination of the Addington well had already ceased for some time. The matter was discussed by Dr. Holden and Mr. Boast, and as a result an adequate dosage of chlorination was applied to the Addington well on Monday morning, November 1. On the same day there were two further notifications, and Dr. Holden immediately communicated with the Ministry of Health. There was a further notification on November 2, and Dr. Holden again got in touch with the Ministry

for the *bona fide* purpose of preserving the mother from special danger to life or health. At the same time, certain precautions must be taken. Two weapons were available for defence against the unscrupulous patient and the over-sympathetic practitioner. These were (1) notification of all cases of therapeutic abortion before the operation was performed, and (2) the unanimous agreement of a board of three individuals—namely, the family practitioner, the surgeon performing the operation, and a disinterested physician, surgeon, obstetrician, or alienist, with special knowledge of the condition for which the operation was suggested.

Notification

Sir Beckwith Whitehouse was of opinion that while notification was no hardship to the genuine patient, it would act as a deterrent to the potentially criminal type of applicant. The mere fact that the case had to be notified would reduce the number of cases in which it was necessary. Some form of notification of therapeutic abortion was a reform urgently and increasingly necessary. By its means the light of medical and public criticism would be focused for good or evil upon those individuals who developed a penchant for this type of practice. The reference to a board of three persons would also have the effect of tightening up the existing law and limiting the activities of the medical abortionists. He added that if reform of the law on abortion simply implied increased licence in the performance of an operation which the majority of obstetric surgeons detested, then he would be no party to it. What he wanted was the law so amended that when the genuine indication arose they might say to themselves and their patients, irrespective of questions of life or death, "This operation is both justifiable and legal." Further, they were anxious to eliminate from the profession anything that savoured, even remotely, of illegality.

Dr. W. H. F. OXLEY, in opposing the proposition, said the agitation for reform came from three groups: those who wished to enlarge the scope of abortion so as to include all cases where women wished to have their pregnancy terminated, whatever the reason; those who wanted to reduce the number of illegal abortions by increased stringency of regulation; and those in the medical profession who desired a clear statutory definition of the indications which would make artificial termination of pregnancy lawful. There was no need to spend time over the first group, whose main thesis was entirely immoral. He instanced the experience of Soviet Russia, which found that it had made an error in permitting wholesale abortion, and had now passed repressive legislation. As for the second group, he believed that many of the arguments they advanced were unsound and the methods they advised would prove ineffective.

Is Abortion Increasing?

In the first place, there was no proof that abortion was increasing in this country. He gave certain figures compiled in representative localities which appeared to show that the percentage of pregnancies ending in abortion had remained constant over the last forty years. The deaths attributed to abortion had remained steady between 400 and 490 each year from 1926 to 1934. The problem was comparatively small and did not warrant panic legislation.

In pressing for notification by doctors attending cases of abortion, whether spontaneous or induced, the advocates of such a course forgot the clandestine character of illegal operations. Doctors were not called in at all in illegal cases, and therefore the cases on which information was wanted would be the very ones in which it would not be forthcoming. Another suggestion was that the sale of substances used for procuring abortion should be restricted under the Pharmacy and Poisons Act. This would be futile, for the most effective and most commonly used drugs were simple aperients taken in excess. For such

restrictions to be effective the sale of Beecham's pills, Higginson's syringes, and knitting needles would have to be made illegal, which was absurd.

Recent reports had led to the conclusion that the vast majority of intentional abortions were brought about by simple means by respectable married women with families, chiefly for economic reasons. Only by eradicating the economic causes at work could the desired result be secured. Dr. Oxley's conclusion was that the doctor must act in accordance with his generally recognized duties—namely, those of saving the life or the health of his patient; he would not be justified in performing abortion for sociological or eugenic reasons. He did not believe there had ever been a prosecution of a doctor who had kept within his province, and he saw no reason for alteration of the law.

Mr. V. B. GREEN-ARMYtage considered that if the law was to be altered in the direction Sir Beckwith Whitehouse desired a state of inelasticity would be created, no extenuating circumstances would be allowed, and neither doctor nor patient would be benefited. Dr. LETITIA FAIRFIELD also thought that the practical interpretation of the law as regards the health of the mother, not her life only, was so broad that in practice it seemed entirely to do away with the necessity for the very limited reform Sir Beckwith Whitehouse proposed. Her "blood curdled" at the thought of a medical board of three persons: she knew what it meant in necessary formalism—delay, obstruction, and interference. It did credit to the "adolescent innocence" of Sir Beckwith Whitehouse when he suggested setting up such a regulation for the profession. She agreed with Dr. Oxley that there was no considerable increase in abortion. The case histories of over 17,000 women in the maternity wards of L.C.C. hospitals had lately been investigated—women who had come to term or given birth to a viable child—and among them there was a history of under 7 per cent. of abortions. The number of septic abortions in these hospitals was precisely the same in 1936 as in 1931, although in the meantime the maternity accommodation had been greatly extended. The deaths from abortion, although they had fluctuated considerably, were lower in 1936 than at any time during the previous seven years.

Legal Opinions

Mr. T. ANDERSON DAVIES (solicitor) thought there was something to be said for the unmarried prospective mother applying to a board of three persons—he suggested two doctors and a third person such as a court probation officer—who would decide whether it was in the interests of the State that the child should be born. If they said "No," then let an abortion be performed under proper circumstances. But the mother should not be kicked about, the stigmatized parent of an illegitimate child or the partner of an unwilling husband. Dr. BINNIE DUNLOP said he could not vote for either side. He considered that the law should be abolished altogether. If it was said that it was a law against murder, then they had no right to interfere, even on therapeutic grounds, with a pregnancy. They were in that dilemma. It struck him as strange to hear medical people discussing this as if it were a medical law; it was a religious law, an old Church law, and they were endeavouring to produce medical reasons for it.

Mr. HARCOURT KITCHIN (barrister-at-law) thought it a pity that the law should be vague. The medical profession did not want to behave illegally, and he would like to see a subsection declaring that it was lawful for a registered medical practitioner to bring about the miscarriage of a woman if he believed reasonably and in good faith that should her pregnancy be continued it would cause damage to her health. He would also include the rather rare cases of pregnancy following rape and incest. Dr. G. H. ALABASTER pointed out that the reform of the law regarding abortion really turned on

GRANTS FOR SCIENTIFIC RESEARCH

The fourteenth annual report of the trustees of the Ella Sachs Plotz Foundation for the Advancement of Scientific Investigation shows that twenty-six grants were made, eighteen of which were awarded to scientists outside the United States. In the fourteen years of its existence the Foundation has made 308 grants to scientific investigators throughout the world. The list of grantees during the current year includes Dr. Melville Arnott of Edinburgh, for further research into the connexion between renal damage and hypertension; Dr. Ernst Fraenkel of London, for research on the chemical nature of an inhibitory substance in the Rous fowl sarcoma and other malignant growths; Professor William Frei of London, who is studying the questions whether it is advisable to substitute for the original vaccine of the "Frei test" vaccines of animal origin and whether renal stricture is caused by the virus of lymphogranuloma inguinale; Dr. Honor B. Fell of Cambridge, for continuation of Miss S. Glasstone's nutritional studies; Dr. David E. Green of Cambridge, for the isolation and purification of coenzymes I and II from yeast and for pharmacological investigation of the conversion of adrenaline to adrenochrome; and Dr. Alexander Schönberg of Edinburgh, for the study of various chemical problems, one of which relates to a strong oestrogenic agent. Grants are at present limited to investigations in the sciences closely related to medicine and surgery, and may be used for the purchase of apparatus and supplies for special researches, but not for equipment and material which are ordinarily found in laboratories. Stipends for the support of investigators can only be granted in exceptional circumstances. The maximum size of grants is usually less than 500 dollars. Applications for grants to be held during the year 1938-9 must be received by Dr. Joseph C. Aub, Collis P. Huntington Memorial Hospital, 695, Huntington Avenue, Boston, Massachusetts, before the end of April.

ROYAL MEDICAL BENEVOLENT FUND

At a recent meeting of the committee fourteen annuitants were elected, the total amount voted being £398. In addition fifty-one beneficiaries, including twelve new applicants, were awarded grants amounting to £1,134 19s. 5d. The following are particulars of three cases:

Widow, aged 86, of M.B., C.M., who up to the time of his death in 1938 had been in receipt of a Fund annuity of £78, Epsom Pension of £62, and Old Age Pension £26, all of which ceased at his death, leaving his widow with only her Old Age Pension of £26. The Fund voted a grant of £52.

Daughter, aged 67, of M.R.C.S., who since her father's death has supported herself by giving lessons in music and languages. She had to give up her employment and enter hospital, where a panhysterectomy was performed in October, 1937. Her income during the past twelve months had been only £15 from earnings and £15 from occasional gifts. It was stated that only through the kindness of friends, who gave her clothing and many meals, had this lady been able to manage on her income. The Fund voted £31 10s. for nursing home fees, and in addition voted £36 for a period of twelve months.

Widow, aged 62, of M.B., C.M. Since her husband died in 1918 this lady had supported herself as nurse-companion until her last patient died in December, 1937. She is handicapped from getting employment owing to her age, and also to a Dupuytren's contraction. The Fund voted £26.

Subscriptions and donations are urgently needed, and may be sent to the Honorary Treasurer, Royal Medical Benevolent Fund, 11, Chandos Street, Cavendish Square, London, W.1.

An inquiry into the effect of London omnibus men's work on their health will begin early next month at the Ministry of Labour. This investigation was recommended by the Court of Inquiry into the London bus dispute last spring. Mr. John Forster, who presided over the Court of Inquiry, will be chairman of the health investigation; the other members are Air Vice-Marshal Sir David Munro, K.C.B., M.B., and Dr. A. Bradford Hill, nominated by the Medical Research Council, with two representatives appointed by the London Passenger Transport Board and by the Transport and General Workers' Union.

Reports of Societies

THE LAW RELATING TO ABORTION

A debate arranged by the Fellowship of Medicine took place on February 9 on the proposition "That the law of abortion requires reform." This was supported by Sir Beckwith Whitehouse and opposed by Dr. W. H. F. Oxley. There was a very large attendance of about 300.

Mr. JUSTICE HUMPHREYS, who presided, said that the position he occupied on the Bench made it undesirable that he should express any opinion on a proposed alteration of the law, and he contented himself with a statement of the law as it was at present. In 1837 it was made a criminal offence for any person other than the woman herself to use any means for the purpose of securing a miscarriage. In 1861, when the criminal law was consolidated, it included the woman herself as a guilty party. This was the whole law relating to abortion, except for the Infant Life Preservation Act, 1929, which brought into existence the new crime called child destruction. It provided that any person who by a wilful act caused a child which was capable of being born alive to die before it had an existence independent of its mother should be deemed guilty of a felony in the same way as the procurer of abortion, the maximum penalty in both cases being penal servitude for life.

Position of the Doctor

What of the doctor who decided, solely in the interests of the patient, and with a view to saving her life, that a pregnancy must be terminated? Did he come under Section 58 of the Act of 1861? Doctors had said to him, "Do not tell us that nobody would prosecute, or that if prosecuted we should get off. As reputable members of the profession we object to being placed in the category of persons who are committing a crime." Mr. Justice Humphreys said that he could only give his private opinion, though he thought his fellow judges would not differ from his view, that a medical man who in those circumstances terminated the pregnancy was committing no offence against the law. Criminal statutes, like other statutes, must be construed reasonably. To his mind it was unthinkable that the criminal law could have been so stupid as to have provided that a medical man in an effort to save life was committing a criminal offence. On the question whether the doctor was entitled to terminate a pregnancy with the object of improving the health of the patient, that was no doubt one of the matters which would be touched upon in the debate and on which he preferred to remain silent.

SIR BECKWITH WHITEHOUSE said that the law of 1861—in no way ameliorated in this respect by the Infant Life Preservation Act, 1929—was harsh in its implications regard the mother. The art of medicine might to-day in the legal termination of the pregnancy if the mother's or child's life was threatened. Yet both the medical and the legal professions were endeavouring to find loopholes in the law for making an obvious wrong a right. They no longer subscribed to the doctrine that the life of the child was paramount, and that so long as the mother's life was preserved it did not matter what physical or mental wreck she became. Some of the indications advanced for the termination of pregnancy were generally acceptable, others were flippant, and the majority concerned not the life but the health of the woman; but as matters stood to-day all such operations were illegal. Abortions, including so-called therapeutic abortions, were increasing. It was with regard to abortions undertaken for bona fide medical reasons that he asked for reform of the existing law. The law should be re-enacted, as suggested in Taylor's *Jurisprudence* (seventh edition), to exempt from liability the fully qualified practitioner who terminated a pregnancy

It was his considered opinion as a result of the year's work that insulin therapy provided a very promising method of treatment in schizophrenia, especially if applied during the first eighteen months of the illness. He projected a film taken by Kodak Ltd. illustrating in a patient the normal course of insulin therapy from injection to interruption, and including a number of "shots" of different patients to show the phenomena of hypoglycaemia. The facial expressions and muscular reactions of the patients were excellently shown.

General Discussion

Dr. MURDO MACKENZIE said that when drastic methods of treatment were proposed for general paralysis the justification could always be given that here was an inflammatory and killing disease which must be dealt with within a limited period. But the illness under discussion could not be described in that way, and the grounds for advising the treatment must be other than the need for resort to a desperate remedy. The treatment therefore could only be justified on the grounds of experience, and there seemed no doubt from Dr. James's communication that it was clinically worth while. What he wanted to know was whether this new insulin treatment was of any help for those who lived a quiet and aloof life at home, with occasional bursts of excitement and inertia. In mild, persisting schizophrenia was it justifiable to advise admission to a hospital for the purpose of this treatment? As it stood at present, was insulin therapy primarily for the acute and recoverable cases or were long-standing chronic cases likely to benefit? The therapy was completely empirical.

Dr. PULLAR STRECKER said that it had been a disadvantage to this form of insulin treatment that the percentage of complete remissions quoted by the first workers in this field had been too high. Such a figure as 80 per cent. was really too "encouraging." Meanwhile about 3,000 cases had been treated in different countries, and the percentages quoted had become considerably lower. In Switzerland a remission rate of 57 per cent. was mentioned—a much more acceptable figure. With further experience the figure might become lower still, and this would be all to the good, because a sound treatment like insulin therapy was not out to create records. Dr. E. H. LARKIN said that the results at West Ham Hospital had been such that he had come to the conclusion that insulin and cardiazol or one of them alone should be given in all cases of schizophrenia. The quality of the remissions was excellent. Dr. ELEANOR CREAK asked the age of the youngest patient, and whether insulin should be prescribed for the severe attacks appearing and quickly disappearing in adolescence. Dr. DONALD BLAIR pointed out that in considering the relative merits of cardiazol and insulin it should be remembered that the former was comparatively simple to inject, whereas insulin was much more troublesome and required a trained staff. Dr. HENRY YELLOWLEES asked how the duration of the symptoms had been ascertained.

Dr. JAMES, in reply, pointed out that cardiazol alone was rather terrifying for the patient. If he was allowed to become somnolent with insulin and then given cardiazol he did not mind it, and had forgotten the experience by the next day. His view at present was that the combined use was likely to prove better than the use of either agent alone. As to finding out the past duration of the symptoms, the method had been to see one or, if possible, two relatives and endeavour to arrive at the date at which the family first noticed that the patient was queer. The youngest patient was aged 17. Dr. Mackenzie was quite right in commenting on the empirical nature of the treatment. He thought that if the symptoms had not lasted longer than two years the method was worth trying.

SIGNIFICANCE OF SEX HORMONE EXCRETION

At a meeting of the Section of Therapeutics and Pharmacology of the Royal Society of Medicine on February 8, Dr. J. W. TREVAN presiding, a paper was read by Dr. R. K. CALLOW on the significance of the excretion of sex hormones in the urine.

In reviewing recent work, Dr. Callow said that the sex hormones known to be excreted in the urine were not identical with the hormones which had been actually isolated from the organs of secretion. Experimentally it was found that when active substances were administered only a very small proportion was excreted in recognizable form, and the excreted form might even be inactive. This general statement applied to oestrogens, androgens, progestin, and gonadotropic hormone. As regards the male hormone, no data had been published on the recovery of this hormone after administration to human subjects, but in the course of an investigation designed for another purpose, under the auspices of the Therapeutic Trials Committee of the Medical Research Council, on the effect of androgens on prostatic hypertrophy, some observations had been made. The administration of testosterone appeared to produce a decrease in the excretion of androgens, which was followed, after administration had ceased, by an increase. With a dosage of 50 mg. a week the total excreted in one case was 9.2 per cent. of the intake, and in another 5.4 per cent. In general it seemed that the destruction and inactivation of male hormone in the body was so intense that the amount of the hormone recovered from the urine was only a very small proportion, unlikely to furnish results of any great significance in respect of male hormone metabolism. Hormone activity in the urine was an uncertain index of hormonal activities in the body. In the case of male hormone activity the lack of relation between urinary androgens and the sexual condition had led to the assumption that the androgens in the urine were largely derived from sources other than the gonads, probably the adrenal glands, and work on this question was being pursued. Again, with increasing knowledge of the chemistry and metabolism of hormones, methods of assaying urine had been devised which gave results capable of correlation with known or assumed physiological processes, notably in pregnancy and the normal menstrual cycle, and obvious effects were produced with certain types of tumour.

In cases where relatively large amounts of hormone were produced and excreted, hormone assay was an extremely valuable aid to diagnosis. In quite another category, with present methods, or even perhaps improved methods, were the mildly abnormal cases. He thought that the assumed significance of urinary sex hormone estimation must be justified empirically. If it were known definitely that in a certain physiological state a given sex hormone was produced in large amount, and a corresponding product was found in the urine, then a connexion was established, and it would be possible to extend to other circumstances an argument based on analogy. Argument in the other direction, from observed excretion to a process in the body, would be unsafe. He repeated the remark of R. T. Franck, based on nine years' work on hormone assays, that such studies, though they served as valuable aids, could not replace clinical examination and experience. He hoped, however, that the biochemists and chemists might improve the position.

Effect of Tumours of Adrenal Cortex

Dr. LEVY SIMPSON said that normal people, both male and female, excreted so-called male and female hormones in amounts of approximately the same order. By female hormones he meant oestrogenic hormones, and by male the hormones causing growth of comb in a capon. In 1933, on investigating, first clinically, a virile woman, it occurred to him that possibly her virilism and hirsutism was associated with an increased excretion of male

the question of making pregnancy more acceptable. Dr. DORIS ODLUM thought it Gilbertian to hold that the law should not be changed because in fact it was not enforced. The real crux of the problem was the economic question. So long as certain economic conditions persisted the law would be broken whatever the law was.

Dr. JOAN MALLESON said that Sir Beckwith Whitehouse seemed to be considering one small section of women at the expense of the others. His interest seemed to be in those women who could have therapeutic abortions to save their health, and he was not concerned with that large mass of women who were going to have criminal abortion performed in any case. He was concerned to knock out of the business practitioners who were "generous" in their interpretation of the law, but it was because some members of the profession were "generous" that many women were spared self-inflicted criminal abortion, which brought the highest morbidity and sterility rate. Dr. DOUGLAS LINDSAY spoke of the legitimate dread of the coroner's inquiry in England, and contrasted the proceedings in Scotland, to the advantage of the latter, where the inquiry was carried out by the procurator-fiscal, with no attendant publicity unless there was a criminal element, and yet in which no criminal element was allowed to escape.

The Summing-up

The openers having briefly replied, Mr. JUSTICE HUMPHREYS said that he doubted whether statistics of criminal abortion were reliable. Abortions were to a very large extent carried out by the women themselves, and when successful, of course, they never got into the statistics at all. Others were carried out by professional abortionists, people with some slight medical knowledge. He believed the crime of abortion to be increasing, though not to any great extent.

"Dr. Oxley has said—I do not say I agree or disagree, but it is what a brave man would say and would practise—'Consider your patient, consider nothing but your patient's welfare, and if you come to the honest conclusion that your patient's welfare demands that you take a certain course, take it, and run the risk of somebody taking a different view.' I am quite sure that Dr. Oxley would agree with me in this, that it should not be done in a hole-and-corner way, because in that case people may doubt your *bona fides*. You should get your brother physicians or surgeons around you, you should get a thoroughly qualified hospital nurse to come and attend whatever it is you are going to do, you should let the whole world know what you are doing and why you are doing it. Otherwise the man who carries out an abortion which in certain circumstances might be a criminal offence is a fool."

Mr. Justice Humphreys added:

"When somebody puts a concrete case to me, and gives me the history of the patient, saying that the doctor found out this, that, or the other, and came to the honest conclusion that it was essential that an operation should be done, then I do not think that the jury would disagree with the view that the judge would take of the matter, and it would be a view favourable to the doctor. But until you can get some form of words as simple as the words 'for the purpose of saving life,' I hesitate to say that the doctor is entitled to perform an operation for procuring miscarriage merely to make the patient more healthy, because I do not know what you are proposing."

A show of hands was taken on the proposition "That the law of abortion requires reform," and it secured assent by not a large majority. The numbers were not taken.

[A verbatim report of the debate will appear in the *Postgraduate Medical Journal* for March.]

At the annual general meeting of the Devon and Exeter Medico-Chirurgical Society on January 27, with the newly elected president, Dr. ROBERT SCOTT, in the chair, Dr. HUMPHREY FOY discussed the role of radiology in the early diagnosis and treatment of hypernephroma and other renal tumours.

INSULIN THERAPY IN SCHIZOPHRENIA

In the Section of Psychiatry of the Royal Society of Medicine on February 8, with Dr. J. S. GOODALL in the chair, Dr. G. W. B. JAMES (with whom Dr. Rudolph Freudenberg and Dr. A. Tandy Cannon were associated) described a year's experience of insulin therapy in schizophrenia.

The insulin shock method—Dr. James deprecated the word "shock" as unnecessarily suggestive of danger—of treating schizophrenia, introduced by Sakel in 1933 at the Potzl Clinic, Vienna, has been in use at Moorcroft House, Hillingdon, since January, 1937, and Dr. James's communication summarized his experience with twenty-four cases completed during that period. In some quarters there was a tendency to magnify the risks of the method, but Muller in 495 cases treated in Swiss hospitals gave a mortality rate of 0.5 per cent., and probably, with improvement and standardization in technique, this rate might be further reduced. During the first six months at Moorcroft House the Wellcome brand of pure crystalline insulin was used; afterwards a change was made to Boots' insulin, which was a gland extract. It was not easy to give any precise information about the average dose of insulin required to produce hypoglycaemic coma. Coma had been produced by 15 units, while, on the other hand, one case required over 400 units. Blood-sugar estimations showed a fairly constant series of changes. Within an hour of injection the blood sugar fell to 30 mg. per 100 c.cm. or even less; it remained at about that level during the whole of the hypoglycaemic period. Half an hour after interruption, when the patient was conscious, the blood sugar rose to a little below normal, and about one hour after interruption it returned to normal, and continued to rise under the influence of a large carbohydrate supply. Treatment was begun at the hour of 7 a.m., and the total hypoglycaemic period was not allowed to exceed five hours, save in exceptional cases when it went to six hours. In selected cases insulin and cardiazol combined were used, and the combination of the two agents seemed to show better therapeutic results than either alone. In the twenty-four cases there had been seventy-three epileptiform attacks due to hypoglycaemia; fourteen of these were interrupted intravenously and fifty-nine by the use of the intranasal tube. In a total of 1,628 "patient-insulin" days intravenous interruption was necessary on 106 occasions, in the majority of the cases owing to failure to arouse the patient thirty minutes after the nasal tube feed.

Classification of Results

Out of a total of ten cases with symptoms lasting up to eighteen months, nine had returned home and resumed their former occupation. The other fourteen were cases with histories of eighteen months or more, and of these only three had shown remissions; two of the three had returned home, and the third awaited his discharge. Some of the old-standing cases treated showed clinical improvement. The longest period of treatment was 118 days, the shortest twenty-six days, the average sixty-seven days. By the kindness of the members of the British Psychiatric Insulin Society Dr. James was able to present a summary of a further ninety-four cases (among which there had been one death), which, added to the twenty-four already described, gave a total of 118. The results in this total were shown as follows:

Duration of Symptoms	No. of Cases	Complete Remissions	Unimproved
Under 6 months	22	19	3
From 6 to 12 months ..	18	15	3
From 12 to 18 months ..	9	5	4
Over 18 months	69	22	47
	118	61 (51.7 per cent.)	57

hormone, and this point was investigated both on capons and on castrated rats. Fortunately for himself and his fellow investigators this particular woman had a very large excretion of male hormone. If she had been one of those virile women who did not excrete a large amount of male hormone the investigation might never have been continued. They investigated a series of cases, and the majority showed an excess of male hormone excretion. It seemed possible that the adrenal glands were responsible, but that could only be suggested, and it was not until later work was done that this possibility became a probability. Why some of the women excreted an excess while others did not was difficult to say on the assumption that excretion was a measure of secretion, but probably this was not so. Also important was the reactivity of the tissues to such hormones; in some cases the tissues were refractory and in others sensitive. Tumours threw a very interesting light on the problem. He personally had had experience of both an adrenal tumour in a female producing virilism and an adrenal tumour in a male producing feminism—namely, atrophy of the penis with impotence, together with enlargement of breast, female configuration, and a higher tone of voice. The female with the adrenal tumour excreted a very large excess of the male or comb-growth hormone, and the male with the adrenal tumour a large excess of the oestrogenic hormone. Hitherto one had always thought that the histology of two such tumours was much the same, but why should an adrenal cortical tumour in the male produce apparently oestrogenic hormone and in the female apparently male hormone? On examination of the tumour from the female a colleague found some discrete granules which she thought to be of significance and which were absent from other tumours of females which she had examined. These discrete granules were found to be present in normal adrenals, in the inner layer of the cortex, in males at or just after puberty.

If there was such a histological basis, then it must be assumed that somewhere or other the ovary converted a hormone from the adrenal cortex into a male hormone, and the testis converted a hormone from the adrenal cortex into an oestrogenic hormone, which seemed a paradox very difficult to believe. Had this finding of excess of comb-growth hormone in the urine of virile women any diagnostic significance? If the excess was gross could a tumour be assumed? That was very important, because in many cases of Cushing's syndrome it was not known whether it was due to hyperplasia from a pituitary abnormality or whether a tumour of the adrenal cortex should be sought. From the little experience he and his fellow workers had had, he thought it could be said that if the amount of comb-growth hormone was grossly in excess of 300 international units per day one should search very diligently for a tumour, and that if necessary one was justified in doing a laparotomy. Unfortunately some cases of hyperplasia might also show an excess up to 300 units, so that this finding, although suggestive, was not conclusive.

Dr. F. L. WARREN and Dr. A. C. CROOK referred to some experiments bearing out what Dr. LEVY SIMPSON had just advanced, and Dr. A. S. PARKES made some philosophical observations on hormones in general. He felt that it was difficult, if not impossible, to draw any distinction between waste products and hormones. There was something to be said for the idea that all hormones were originally waste products which the body learned later to use. The waste product of to-day might be said to be the hormone of to-morrow. The trend of vertebrate evolution would be towards universal intersexuality. Not only were both the oestrogenic and androgenic substances found in both sexes and excreted by both, but each product had an effect in reproducing the characters of the corresponding sex. [A paper by Dr. Parkes on "Effective Absorption of Hormones" appears this week at p. 371.]

TREATMENT OF OTITIS EXTERNA

At a meeting of the Section of Otolaryngology of the Royal Society of Medicine, on February 4, Mr. F. J. CLEMINSON presiding, a discussion took place on otitis externa, which is also the subject of an article, recording an investigation of 100 cases, by Flight Lieutenant George Morley elsewhere in this issue.

Dr. HENRY MACCORMAC said that the term "otitis externa" implied an eczematous or infective condition of the external auditory canal, but in dermatological practice it was rare to meet an eruption so confined, and therefore the meaning was extended to include the more widely spread eruptions of and behind the ear. He confined his observations to the two most common processes—impetigo and eczema. The treatment of impetigo presented as a rule no difficulty, the lesions responding to various agents. The parasiticide had only to be applied in sufficient concentration to kill the parasite without irritating the skin. The skin was often looked upon as a gas-tight and watertight envelope covering the body, but it was far more than this, with important functions to fulfil. Treatment might be considered in three phases: (1) simple protective and soothing; (2) selective, having specific effect on certain diseases; and (3) parasiticide, including antiseptics.

Mr. G. EWART MARTIN said that otitis externa was entirely a skin disease, and but for the curiosity of its position would come under the dermatologist. Like every skin condition it had two causal factors—the invading organism and the resistibility of the individual. The development of idiosyncrasy had been shown to be due to previous contact with the irritant, but this could be demonstrated only in a few cases, and in the large majority no reason was afforded for the change in skin response. He classified otitis externa into (1) acute otitis externa, or furunculosis; (2) croupous otitis externa; (3) acute haemorrhagic otitis externa; (4) otomycosis, including all the inflammations of the external ear due to fungi; and (5) a group usually described as an eczema of the external auditory meatus, really a meatitis, acute or chronic, for which he suggested the term "dermatitis." A four-year analysis of cases seen in the department of the Royal Infirmary, Edinburgh, showed that 55 per cent. of the cases were furunculosis and about 30 per cent. eczema of the meatus. The largest seasonal incidence of furunculosis, like otitis media, occurred in the period from December to March, and eczema of the meatus showed its largest figures in July, shortly after the start of the bathing season. The principles underlying treatment of skin conditions were: first, cleansing of the part; secondly, application of a simple non-irritating antiseptic or other local treatment; and, thirdly, treatment of the cause. It was best not to experiment with a multiplicity of methods, but having found a suitable application to learn how and when to use it. It had been his practice in furunculosis never to excise except in extreme cases, believing that incision would only act as a further point of access for the invading organisms.

Some Precautions in Treatment

Mr. ERIC WATSON-WILLIAMS said that otitis externa almost disappeared from the realm of difficulty if hydrogen peroxide were rigidly excluded from the ear and indeed from the otological department. Often all that it was necessary to do was to tell the patient to stop treating his ears with hydrogen peroxide. His guiding principle in the treatment of otitis externa for many years had been to prevent water from going into the ear. It was true that syringing was necessary when there was a hard mass of wax or epithelial debris, but he did not think that water had any other place in treatment. In cases of impetigo his experience was that if the child patients were given iron for a month it shortened and simplified the treatment of the ear condition.

Mr. RITCHIE RODGER pointed out the danger of over-treatment in the more chronic eczematous processes or

Glasgow Western Infirmary

At the annual meeting of contributors to Glasgow Western Infirmary on February 11, when Sir John Stewart presided, Sir Henry Mechan said that the managers had in view the building of an extension to accommodate paying patients such as the other two infirmaries of Glasgow had. There was no possibility, however, of this being done at present owing to lack of funds. The report of the Infirmary showed that maintenance expenditure amounted to £104,349 and ordinary income to £77,860, the deficit being met from unrestricted capital. During the year new heating plant was completed and heavy payments were made in extensions of the pathological block, laundry, and x-ray departments. The number of patients treated was 13,465, an increase of 272 on the previous year. The average number of patients per day was 661. Out-patients numbered 52,447, of whom 12,734 were casualty cases, and 14,657 were treated in the radiological department. The radium department served a large area, and the National Radium Commission had expressed its approval of the organization at the Infirmary by allocating three grammes of radium. It was hoped that the Gardiner Institute of Medicine would be completed for the beginning of the winter session 1938-9.

ENGLAND AND WALES

Hospital Almoners' Association

The annual dinner of the Hospital Almoners' Association took place on February 5 at St. Ermin's Restaurant, London. Miss Macintyre, chairman of the association, presided. The principal speaker was Sir E. Farquhar Buzzard, Regius Professor of Medicine at Oxford University and president of the Institute of Hospital Almoners, who, in proposing the toast of the association, spoke of the days before the introduction of almoners into the hospitals and the difference which their coming had made to medical work. He spoke also of the future development and extension of the social work and the possibility of the collected experience being a valuable contribution to sociological research. Mrs. A. W. Tomkins, assistant almoner, St. Thomas's Hospital, responded for the association. Mr. H. Chitty, honorary surgeon to the Bristol Royal Infirmary, replied to the toast of "The Guests," which was proposed by Miss M. Streatfield, assistant secretary of the Institute of Hospital Almoners. Among other guests present were Dr. Margaret Hogarth, assistant medical officer of health to the London County Council; Mr. E. Ridley, director of public assistance to the Middlesex County Council; Dr. Stallybrass, deputy medical officer of health for Liverpool and vice-president of Liverpool Medical Institute.

Institute of Ray Therapy

The hopes and plans of many months, and indeed of years, were brought to fruition on February 5, when an extension of the Institute of Ray Therapy in Camden Road, London, was opened by the Princess Royal. This "hospital for electro-physical treatment," which is its subtitle, was opened eight years ago, but hitherto its excellent work has been done under extremely cramped conditions. The new wing affords adequate, if not abundant, space, and it is declared that the hospital is now equal to anything of its kind in this country or on the Continent. Some account was given of the project when its purpose was announced at an earlier function (*Journal*, April 24, 1937, p. 884). The first floor of the extension provides for treatment by diathermy of several patients at a time. There is a section for the older forms of treatment by medical electricity, but with up-to-date appliances, and another section furnished with much

interesting apparatus for physical and remedial exercises. The ground floor is also to be equipped for electrotherapy when funds are available.

On the occasion of the opening the Princess Royal was received by the Mayor of St. Pancras, the president of the Institute, Lord Horder, and the hon. medical director, Dr. William Beaumont. After a number of presentations had been made, including the chairman of the governors, Lord Sempill, and the chairman of the medical advisory committee, Sir Robert Stanton Woods, a short address was read to the Princess by Lord Horder in asking her to declare the extension open. Lord Horder pointed out that the general hospitals, limited as they were by space and funds, could provide only for those conditions which were their first concern, such as acute illnesses, serious accidents, and complex and obscure diseases. They were unable to deal with many of the chronic diseases which gave rise to a great amount of incapacity. Illnesses which caused only partial incapacity had been sadly neglected in the past. Here was the value of the Institute of Ray Therapy, which filled many gaps and afforded treatment for minor ailments which reduced the efficiency of the worker. It aimed to prevent such ailments from becoming major maladies.

"We in the medical profession," Lord Horder continued, "know that in our history occasions arise when the clamour of the public brings about the adoption and amplification of certain methods of treatment which would otherwise remain of theoretical interest only. We recognize that to a great extent it is this urge which has been responsible for the great expansion, during the last few years, of physical medicine. No more striking argument could be put forward for the need of this institution than the fact that we are gathered to-day to see the opening of this extension, made necessary by the demand for still more accommodation and still greater advances in these methods, although already three thousand and more treatments are being given every week."

After the Princess Royal had declared the building open a prayer of consecration was offered by the Archbishop of York, a "human account" of the work of the Institute was given by Lord Sempill, and then an old patient and a present patient offered purses on behalf of old and present patients respectively, and other gifts were made. The Princess spent some time inspecting the new wing, and manifested particular interest in the gymnasium, the various electrical appliances, and the labour-saving devices to ease the work of the nursing staff. One feature of the new building is its admirable lighting by very large windows.

Scientific Treatment of Delinquency

The Institute for the Scientific Treatment of Delinquency has acquired a house, No. 8, Portman Street, W., for the purpose of a clinic, and the opening ceremony took place on February 9 in the presence of the Mayor of St. Marylebone, representatives of the Home Office, and a number of prominent magistrates and medical men. The clinic contains departments for vocational guidance, graphological research, intelligence tests, and the measurement of temperament, for which last purpose an instrument known as the McDougall-Schuster dotting machine excited some interest. The clinic is intended to be used for investigation into the various forms of mental maladjustment. About seven years ago a scientific investigation was carried out on a number of prisoners in Holloway by a psychologist on behalf of the Medical Research Council, with assistance from the Home Office. As a result it was considered desirable to have a permanent centre for the examination and treatment of cases of anti-social conduct, especially among young people coming into conflict with the law, and the movement just started has been widened into an organization for research into the causes, treatment, and prevention of anti-social conduct of all kinds.

Lord Roche, Lord Justice of Appeal, in declaring the clinic open, said that in his view the first function of such an institute was to determine with more certainty than

that the same vitamin which restored normality to the biochemistry of the tissue *in vitro* would rapidly cure the opisthotonos in the pigeon showing symptoms. Hence there was a direct connexion between these central symptoms and a fault in the enzyme system of the brain, due to lack of the vitamin. The only other tissue from the avitaminous bird in which these vitamin effects had been demonstrated *in vitro* experimentally was the kidney. This perhaps helped to explain oedema. Increased lactic acid could also be explained by this scheme when it was realized that pyruvate accumulated in the blood in B₁ avitaminosis in both pigeons and rats, because pyruvic acid was known to block the oxidation of lactate. The abnormal appearance of pyruvate was soon stopped by giving the animal vitamin B₁. The increased pyruvate in blood did not necessarily coincide precisely with the induction of the symptoms, but it was wrong to consider the symptoms as induced by the pyruvate. It was not yet certain whether the known biochemical fault in brain and kidney would explain the increased pyruvic acid in the blood, or whether there were still other unknown disturbances concerned.

The above gave a clear and logical picture of abnormalities in the avitaminous animal, with two exceptions: (1) the initial failure in appetite, occurring long before any other avitaminous manifestations; and (2) the increases in sugar tolerance found in the terminal stages of vitamin B₁ deficiency together with occasional disturbances in the regulation of the storage of glycogen in the liver. If these changes were considered to be primary defects due to lack of vitamin, then there was some other biochemical system, as yet unknown, with which vitamin B₁ acted; but if they were secondary to the initial fault in the brain, then some of them became intelligible. They would be the results of dysfunction of the essential brain cells concerned in carbohydrate regulation. This formed a useful working hypothesis.

Dr. B. S. Platt said there were substances normally present in human blood which bound bisulphite. They were found in increased amounts in the blood of cases of fulminating beriberi. Pyruvic acid was one of these substances. Increased amounts of it were shown to occur in trichloroacetic extracts of blood, urine, and cerebrospinal fluid taken from patients with fulminating beriberi. In uncomplicated cases of fulminating beriberi with increased amounts of pyruvic acid normal levels were restored in the course of ten to fifteen hours after intravenous administration of 5 mg. of pure vitamin B₁. It had been shown that vitamin B₁ was concerned in the intermediate metabolism of carbohydrates. Changes in amounts of metabolites in the blood in states of vitamin B₁ deficiency were considered to be evidences of disturbances arising in tissues whose carbohydrate metabolism involved vitamin B₁. The operation of some factors—fever, increased intake of carbohydrates, muscular effort—which were known to affect metabolism in the body led to accumulation of pyruvic acid in the blood in states of vitamin B₁ deficiency. It was suggested that the effects of accentuating factors contributed to the development of the various clinical types of beriberi. These effects might be of more importance in this respect than the differences in the grade of vitamin B₁ deficiency. When accentuating factors were minimal it was probable that well-defined changes only appeared after a comparatively long period of deficiency. Changes secondary to the failure of various organs and associated disease modified the clinical picture of beriberi. The effects of treatment with vitamin B₁ must be assessed with cognizance of the fact that damage to tissues might ensue, especially in long-term deficiency, which could not be repaired merely by correcting the vitamin deficiency.

Miss HARRIETT CHICK said that the work just presented was very encouraging, inasmuch as it gave overwhelming evidence that vitamin B₁ had everything to do with the development and symptomatology of beriberi—at least in this particular form. She asked why the therapeutic results in the past had been so contradictory. Professor

HAWES, in reply, pointed out that defective standardization and insufficient dosage accounted for this.

Dr. J. BARCROFT ANDERSON referred to Dr. Rowland's work, which had shown that continued deficiency of the vitamins of grain germ resulted in a diminution in the size of nerve cells and fibres, reduced unstriated muscle to one-third of its bulk in the intestine of rats, and produced degenerative changes in the kidney. Sir LEONARD ROGERS asked if the effect of B₁ injections had been determined in infantile beriberi. Dr. PLATT said that infantile beriberi was probably the purest form of B₁ deficiency. Dr. WILLIAM HUGHES said the therapeutic results were excellent in children; after 1,500 units were injected it took about three days before the child cried.

Dr. H. M. SINCLAIR asked if the neuritis in beriberi was due to a deficiency of B₁ and whether it responded to therapy. Professor HAWES, in reply, said that in only a few cases was the nervous condition cured dramatically; in many cases the symptoms persisted for months. Obviously another factor was involved in the neuritis. In regard to infantile beriberi it was easier to give injections of B₁ to the mothers before childbirth and when breast-feeding the baby to prevent attacks. The mothers frequently had no signs of beriberi, yet the infants might develop an acute attack and die.

SCOTLAND

Empire Exhibition, Glasgow, 1938

The Scottish Committee of the British Medical Association has co-operated with the Department of Health for Scotland in arranging for a demonstration of "The Contribution of Scotland to Medicine" at the forthcoming Empire Exhibition in Glasgow. This demonstration will be largely historical in character and will deal with the part played by individuals, medical schools, and hospitals. A special subcommittee has already held several meetings. The Scottish Secretary (Dr. R. W. Craig, 7, Drumsheugh Gardens, Edinburgh) will be glad to hear from any member of the Association who is prepared to lend interesting relics or photographs.

Edinburgh University

The Senatus Academicus of Edinburgh University at a meeting on February 11 awarded the Cameron Prize for 1938 to Karl Landsteiner, M.D. Vienna, a member of the Rockefeller Institute for Medical Research, New York, in recognition of his researches on iso-haemagglutinins and blood groups, and for the influence of his discoveries on the practice of therapeutic blood transfusion. The Senatus also awarded the Straits Settlements Gold Medal to Thottakat Bhaskara Menon, M.D. Madras, D.Sc., for the excellence of his thesis on "Pathological Studies on Splenomegaly."

Scottish Committee on Nursing

The Departmental Committee on Nursing, which is inquiring into the recruitment and the terms and conditions of service of nurses in Scotland, has held two further meetings. At these meetings oral evidence was given by representatives of the Scottish Branch of the Queen's Nursing Institute, the Scottish Matrons' Association, the General Nursing Council, the Scottish Institution of Nurses, the General Board of Control for Scotland, Stirling Royal Infirmary, and Fife County Council.

Correspondence

An English Pneumonia Service

SIR,—As was pointed out in a leading article (*Journal*, January 8, p. 76), good results have been obtained in America from the serum treatment of pneumonia. In view of the high mortality in this country it was felt that the Circular 1499 and the Memorandum of the Ministry of Health (Med. 189) upon this matter should be acted upon. Incidentally, neither the circular nor the memorandum mentions pneumonia sera. After consultation with some keen practitioners in my area I arranged to have available some Type I, Type II, and mixed Types I and II serum, and a service for the typing of pneumococci. Some dramatic results were quickly obtained, and a demand was made for the serum to be available day and night; this was arranged. So far as I am able to tell—and I hope someone will correct me if I am wrong—we, as a county council, have no power to supply pneumonia serum. Obviously with serum at 25s. per 10,000 units we were heading for a surcharge of some dimensions when patients (some agricultural labourers) were unable to meet bills of £10 to £12 or more. We were therefore forced to charge more for the serum than it cost us in order to prevent a loss on our accounts. It might be asked, "Why not leave the practitioners to get their own serum?" At 25s. per 10,000 units for a serum which deteriorates rapidly, they just won't. So it is left to the public authority to sustain another puling wail of curative medicine!

The Holland County Council pneumonia service began in January, 1936; the Ministry's circular was received in October, 1935. The routine method used is to prepare and stain a film of sputum immediately upon receipt; this gives information as to whether the pneumococcus is present or not, and if present in what numbers, and proves helpful when doing the actual typing. In view of the fact that half the pneumococci belong to either Type I or Type II, it is our custom when pneumococci are present to examine first for these two types.

Small flecks of sputum are separately well mixed on marked slides with Types I and II diagnostic anti-pneumococcus sera (rabbit), the amount of sera depending on the consistency of the sputum. A small loopful of alkaline methylene-blue stain is then added and mixed. Cover slips are applied, the slides inverted and pressed out on blotting paper to ensure a thin film, and the edges sealed with vaseline. These preparations are then examined with the oil-immersion lens under artificial blue light, the condenser diaphragm being regulated to give the most satisfactory illumination. In the event of pneumococci being found in a stained film and the Neufeld reaction not being obtained in either of these two cover-slip preparations, recourse is had to the group mixtures of the other various types of anti-pneumococcus diagnostic sera, using the same technique.

It is important when running a service of this kind to impress general practitioners with the necessity for submitting only fresh specimens of sputa—that is, the specimens are to be examined within two hours of production. Autolysis of the capsule takes place after this period. Specimens that cannot be examined within two hours should be kept on ice, and then may be examined up to twenty-four hours later. Some practitioners when unable to obtain a typing test give anti-pneumococcus sera Types I and II mixed as a precautionary measure until they can have such a test carried out.

The call upon the service is almost confined to the winter months, especially during influenza epidemics. In

this small scattered rural county of 95,000 population we have carried out approximately fifty examinations of sputum at a cost of 5s. per test. It is not possible to give exact figures, as records of the typing were not kept in the first few weeks of the scheme, and our consulting staff sometimes come to the laboratory at night to type sputum of which no record is kept. For us this work has been in the nature of an experiment, but there is no doubt that many lives could be saved if it were extended to every authority with a laboratory. We are, of course, greatly handicapped by having no powers to supply sera to patients free of charge or at a greatly reduced price. To type without keeping and supplying serum is useless. Will the Ministry allow us to take advantage of the knowledge gained by our American colleagues? Surely we have passed the stage of collecting statistics: may we get on with the job?—I am, etc.,

W. G. BOOTH,

Holland, Lincs, Feb. 7.

County Medical Officer of Health.

Recovery in the Spinal Cord

SIR,—Dr. F. A. Pickworth (February 5, p. 307) is apparently dissatisfied with my statement of the requirements for recovery of function in the spinal cord (*British Medical Journal*, December 18, 1937, p. 1242), and says summarily: "Recovery of function in the cord is primarily dependent upon the restoration of blood supply to ischaemic areas."

I must point out that I placed absence of interference with the circulation in my first set of conditions for recovery, and put it on an equality with, not subordinate to, absence of severe damage to the structure of the cord. That is its rightful position. It cannot be more important than structural continuity. Restoration of blood supply avails little if nearly all the fibres of the cord are divided.

In regard to non-surgical diseases of the cord Dr. Pickworth's insistence upon the restoration of blood supply to ischaemic areas is not of much practical help. We do not yet know whether in such diseases there are any ischaemic areas (in his sense) or whether, if there are, the ischaemia is of sufficient degree to cause interruption of function and structural degeneration, or whether recovery of the cord follows restoration of the blood supply alone. Dr. Pickworth has unguardedly allowed himself to state as fact what is merely inference from unconfirmed theory. If ischaemic areas in his sense are present in the cord in subacute combined degeneration or in the acute phases of disseminated sclerosis, or if they occur in consequence of infection of the bladder, ischaemia is at most only the means by which more primary factors exert their influence, and for practical purposes we are concerned with the more primary factors. Mott's experiment, to which Dr. Pickworth refers, is of very limited application to the diseases mentioned in my talk or to any condition involving paraplegia with spasticity.

Relative integrity of the blood supply to the affected parts of the cord is one of a number of factors essential to recovery of function, but it would be wrong in the present state of our knowledge to call it "primary" and blind ourselves to the equal practical importance of others. Different requirements assume special importance in different conditions.—I am, etc.,

London, W.1, Feb. 14.

JAMES PURDON MARTIN.

could be done at present into which of the categories of criminals a convicted person was properly to be placed, whether he belonged at the one extreme to those who offended against the law because of a weakness or infirmity which might be cured, or, at the other, to those who were determined to live preying on society. The second function was, by the care and skill of psychiatrists, to endeavour to remove the cause which had led the offender to commit the offence. His own experience of seventeen years as a judge in the King's Bench Division, spending a considerable proportion of his time trying criminal cases on Assizes and at the Central Criminal Court, was that administrators of the law badly needed such an institute and could derive essential help from it. He hoped that those in judicial authority would increasingly seek the aid of the right judgment which such an institute could in appropriate cases afford. Lord Roche went on to say that there was a certain suspicion of "odium medicum" attaching to this as to all comparatively new branches of medical science. "There is a certain justification for this attitude in general because new developments have a way of attaching to them exponents who make extravagant claims or may be even charlatans. Believe me, there is nothing of the sort here. This Institute is administered and served by men of high scientific attainments, having the honesty and humility that impel them to recognize and observe the due limits of their science and their art. You need have no fear that you are supporting cranks or charlatans; the whole thing rings true." He added that one of the great merits of the new home of the Institute was that it seemed in its arrangement and appearance to wear the respectable air of a series of adequate consulting rooms. Dr. E. T. Jensen, chairman of the Institute, in expressing thanks to Lord Roche, suggested that this movement was only on the threshold of what might prove to be a large national institute of criminology. Dr. Denis Carroll described the work of the Institute, of which he had been one of the chief directive forces. The courts referred to the Institute a number of delinquents, who were tested for intelligence and in other respects, and an impartial review was given to the court as to the delinquent's mental state and its relevance to the offence with which he was charged. Some were found to be suffering from various diseases, physical or mental, and among the mental conditions certain eccentricities and some instances of psychopathic personality were to be classed. Of some 500 persons seen since the Institute began its work roughly one-half had been treated in one way or another. It was necessary to wait at least ten years before talking about successes, but so far only twenty relapses were known. Dr. Edward Glover, chairman of the Scientific Committee of the Institute, also spoke to a vote of thanks, after which the building was inspected by the large company present.

Co-ordination of Newcastle Hospitals

Newcastle-upon-Tyne, following the example of a number of other large provincial centres such as Manchester and Liverpool, has set up a Newcastle Hospitals Joint Advisory Board, with representation on it of the municipality, the voluntary hospitals, and King's College. At the opening meeting Lord Eustace Percy, Rector of King's College, was chosen to be its first chairman. The purpose of the board is to act as a joint body for consultation between the corporation and the voluntary hospitals, and it is empowered to advise the constituent bodies on all matters affecting the hospital services of the city, both municipal and voluntary, so as to promote the best use of all available hospital facilities in the development of an efficient service for the city as a whole. Matters to be discussed may include the provision of new in-patient, out-patient, and casualty facilities and new bed accommodation, buildings, and equipment, and the extension of existing facilities; the principles underlying the medical and surgical staffing of hospitals concerned; financial arrangements between municipal and

voluntary hospitals for services undertaken; medical education and research; and "all matters of common interest to municipal and voluntary hospitals, whether directly or indirectly connected with the hospital services." The founder members, elected for three years, are the Lord Mayor and nine other members of the City Council, together with the medical officer of health, Dr. John A. Charles; Lord Eustace Percy, Sir Robert Bolam, Professor R. Bramble Green, and Mr. H. B. Saint, representing King's College; Sir Ralph Mortimer, Professor W. E. Hume, Mr. F. C. Pybus, Dr. S. Whately Davidson, Councillor W. Cook, and Mr. J. H. Burn, representing the Royal Victoria Infirmary; Dr. W. MacMurray, the Hospital for Sick Children; Professor R. P. Ranken Lyle, the Princess Mary Maternity Hospital; Mr. L. H. Booth, the Eye Hospital; Mr. S. Phillips, the Throat, Nose and Ear Hospital; and Dr. J. C. Spence, the Babies' Hospital and Mothercraft Centre. The board has power to co-opt, without voting power, any person's possessing special knowledge which would be of material assistance to the board or its subcommittees.

Bradford Health Services

At a public dinner in Bradford last week the Lord Mayor, Alderman H. Hudson, asked if any city in the kingdom could equal Bradford's record as a pioneer in matters pertaining to the health and well-being of the people. In 1920, ten years before any county borough or county council possessed such a hospital, Bradford opened a municipal general hospital. It appointed a school medical officer in 1894, thirteen years before Parliament made such appointments compulsory. As long ago as 1904 Bradford was agitating for powers to feed children who went to school underfed, and when the Education (Provision of Meals) Act, 1906, became law Bradford was the first authority to put it into effect. In 1907 the first open-air school in England was opened there; the first municipal maternity hospital was opened there more than twenty years ago; and municipal midwives were appointed in the city in 1917. Bradford used to have a school for blind children, but as a result of the vigorous steps taken the school had been closed because blindness among children in Bradford was now rare.

Fracture Services

Sir Kingsley Wood, the Minister of Health, recently visited Ipswich and inspected the council's housing estate, the health clinic, and other institutions, and performed the opening ceremony for the new orthopaedic out-patient department and fracture clinic at the East Suffolk and Ipswich Hospital. Speaking at the Town Hall, Sir Kingsley said that a substantial proportion of incapacity in the community was represented by fractures and allied injuries caused by accidents, whether in industry, on the road, or in the home. To-day well over 200,000 fractures were treated annually in hospitals up and down the country. It was of first importance that the organization should be improved and the best and most modern forms of treatment devised and made available. Throughout the country fracture services were needed which would place within the reach of every injured person the benefit of treatment. By this means we could mitigate suffering, reduce the period of disablement, and do much to secure restoration of working capacity. There was a general demand for a better service, inasmuch as only about a quarter of the cases treated were dealt with in departments organized in accordance with modern principles. Industry was particularly interested in this development because experience had shown that the period of disability could be enormously reduced by modern methods of treatment. Workers could be saved much suffering and discomfort and the employers saved much dislocation of their business. He was glad to know that in a number of leading industries of the country financial support was being given to schemes for improved fracture services.

contact with someone else who is acutely infected. With regard to the standard of normality we are, therefore, compelled to rely upon the opinion of an experienced oto-rhino-laryngologist.

In conclusion, we should like to say how much we appreciated Dr. Colebrook's most critical letter and to point out once again what both communications have already stressed—"all pyrexias in the puerperium must be regarded as streptococcal in origin until proved to the contrary by a bacteriological examination."—"We are, etc.,

J. L. MILLER WOOD.

F. E. CAMPS.

Chelmsford, Feb. 8.

Temporary Sterilization by X Rays

SIR,—Although temporary sterilization by x rays is possible the length of time it lasts is so uncertain that those of us who have had experience of deep x-ray therapy have given up this method for other more certain ones. It is extremely difficult to induce temporary amenorrhoea of a definite length of time in a very young subject. In my own experience I find that I can promise an amenorrhoea lasting two years or more in a patient of over 43 years if I give a 40 per cent. to 49 per cent. unit skin dose to each ovary. The same dose in a patient of 25 may have to be repeated in three or four months to induce an amenorrhoea of even five or six months' duration. Temporary sterilization by x rays in a young married woman is too uncertain to justify what, after all, is a somewhat drastic treatment. The application of an intra-uterine dose of radium for the same purpose has been suggested, but here again the results are very uncertain. Indeed, there are cases in which, after a full cancer dose—which is at least seven or eight times as great as the dose used for menorrhagia—the patient has later on conceived and been delivered of a full-time child.

I have frequently induced amenorrhoea in older patients suffering from metropathia haemorrhagica or small fibromyomata, and among these, occasionally, the periods have recurred some years after. But for the first few months after treatment I have always advised contraceptive measures in addition when it was advisable that the patient should not become pregnant—I am, etc.,

London, W.1, Feb. 14.

L. MARTINDALE.

Contraceptives and Fertility

SIR,—The Medical Subcommittee of the National Birth Control Association has ventured to contest Mr. V. B. Green-Armytage's statement that "contraceptive measures in the early days of marriage were inimical to pregnancy at a later date," and has declared its inability to find evidence in support of his statement. May I be allowed to assist the subcommittee? In the monograph on sterility and conception by Gardner Child (1931, p. 89) it is stated: "When artificial means are used to prevent conception and are indulged in for any length of time they are quite liable to create a habit of sterility." In the London Medical Society *Transactions* (1936, 59, 120) Mr. Lane Roberts states: "At times the endocervical secretion becomes hostile to spermatozoa because of the mechanical viscosity resulting from either poor cervical drainage or an endocervicitis"; and (p. 130): "To take at random some infertility factors found in one series of one hundred cases, in the woman, in 28 per cent. endocervicitis was the factor." Professor James Young (1933, *Textbook of Gynaecology*, third edition) states that chronic endocervicitis is a cause of sterility of uncertain importance; "it may prevent insemination by leading to an inflammatory

blockage of the canal or by producing discharges which are hostile to the spermatozoa." Eden and Lockyer's *Gynaecology* (fourth edition, by Beckwith Whitehouse) states: "There can be little doubt that the lesion [erosion], accompanied as it is with alteration in the amount and character of the cervical secretion, is a cause of diminished fertility."

It can hardly be doubted that the practice of contraception, with all its mechanical, chemical, and infective possibilities, is capable of causing chronic changes in the cervix. Contraception involves insertion of the finger, and contamination from handkerchiefs must sometimes occur.—I am, etc.,

London, W.1, Feb. 13.

GEORGE H. ALABASTER.

SIR,—When the secretary of the National Birth Control Association submitted her apology in the *Journal* of February 12 she picked out one line of a verbatim report and neglected to refer to the answer which I supplied when she wrote to me on January 25 on the matter. It was as follows:

In answer to your letter of the 25th instant, I did use the words which you quote at the meeting of the West London Medico-Chirurgical Society, and my conviction is as stated for the following reasons:

(a) That if the hymen is unruptured at the time of marriage, inversion of jellies or medicated pessaries upsets the physiological pH of the vagina, with the result that the cervix is bathed in an acid medium far lower than pH 4 for some hours. The result is irritation of the external os with subsequent erosion and endocervicitis.

(b) Should in the early years or months of matrimony rubber caps with a containing soluble pessary be applied to the cervix for a matter of twelve hours or longer the resulting effect is the same as in (a).

(c) I have noted this particularly during the last twenty years, during which time I have seen over 800 cases of sterility. A large number of these have used (a) or (b).

(d) In the discussion I stated that if for medical or other reasons contraception was necessary in the early months of matrimony it should be relegated to the use of a condom by the husband and not by the insertion of chemicals of any kind by the woman.

(e) It is of course well recognized and taught psychologically that the early and continued use of contraceptives, either by husband or wife, diminishes libido and orgasm in both parties.

(f) I also referred to the statement by Professor Miles Phillips which appeared in the *B.M.J.* a few weeks ago under the heading of "Endometrioma" in a discussion at the North of England Gynaecological Society, stating the opinion that the early use of contraceptives was responsible for the increasing number of cases of endometrioma which are seen to-day in young people.

(g) There are other moral and minor factors with which I need not detain you, but I think you will find that experienced gynaecologists, male or female, will agree with my statement that contraceptive measures in the early days of marriage are inimical to pregnancy at a later date.

—I am, etc.,

London, W.1, Feb. 11.

V. B. GREEN-ARMYTAGE.

Time for Midwifery

SIR,—There is still much nonsense written about maternal mortality in the Press, but surely the statement of Dr. John Elam in the *Journal* of February 5 (p. 310), that "the basic reason of inexpert midwifery is only want of time," is the most absurd. Time without knowledge and skill will not cure inexpert midwifery. If he means that practitioners will not take time over their cases the statement is objectionable.

A Warning against Excision of the Patella for Recurrent Dislocation

SIR.—Recently Mr. Ralph Brooke published^{1,2} and showed the results of excision of the fractured patella. Since that time I have seen two cases in which different surgeons had removed the patella for recurrent dislocation. In each the symptoms of recurrent dislocation of the extensor apparatus continued after the operation.

Case 1.—A maidservant, aged 23, had begun six years previously to suffer from attacks of locking of the left knee with outward displacement of the knee-cap. The patella had been excised on this account thirteen months before I saw her. A month after operation the attacks of locking had returned, with all their previous characteristics, except that the patella itself was absent. Elmslie's operation of re-alignment of the extensor apparatus was performed five months ago, and there has been no recurrence of the symptoms since.

Case 2.—A girl, aged 16, a leather worker, had first experienced giving way of the right knee, with locking, two years before. This had continued to happen about once a week, sometimes in bed, and she had discovered that the event was accompanied by outward displacement of the knee-cap. Reduction would be achieved by a kicking movement. She had been treated at first with a walking caliper and later by excision of the patella. Six or seven weeks after the operation the symptoms had returned, attacks occurring with about the same frequency as before. Re-alignment of the extensor apparatus has been advised.

Neither patient showed knock-knee or any radiological abnormality of the external femoral condyle.

This note is written as a matter of urgency, in the hope that surgeons contemplating removal of the patella for recurrent dislocation will be dissuaded, and perform rather a physiological operation of re-alignment of the extensor apparatus on the lines of Elmslie's³ operation.—I am, etc.,

H. JACKSON BURROWS, M.D., F.R.C.S.

London, W.1, Feb. 7.

Throat Carriers in Midwifery Practice

SIR.—We were disappointed when our original paper (*Journal*, October 23, 1937, p. 811), which was meant to be provocative, failed to elicit any correspondence, and we are, therefore, still more disappointed when we find that Dr. Dora Colebrook's most interesting criticism (*January 29*, p. 253) has failed in a similar manner. We feel, however, that we cannot let some of her remarks pass unchallenged.

In the first place, with regard to the nomenclature we employed, since the definition which she has quoted was put forward knowledge has increased, and we feel that *Streptococcus pyogenes* may now be defined as a β haemolytic streptococcus which is pathogenic to man. It will usually fall into Group A of the Lancefield classification, but there is evidence to suggest that organisms which fall into other groups of this classification may cause human infections. It is in this matter that we are inclined to disagree with Dr. Colebrook about the value of grouping alone. The technique employed in this laboratory is to attempt to type the organisms by agglutination, and if agglutination fails, to determine the group. By this method one detects and includes among the known pathogens certain types not in Group A without ignoring other streptococci, which, though not yet identified as types, can be classed as

belonging to Group A and are, therefore, potentially pathogenic. We cannot follow Dr. Colebrook's argument that the name Group A without any prefix is a sufficient identification of the pathogenic streptococci. We feel that if we have been confusing then the point should be clarified, especially as on questioning practitioners recently we find that not only does the name Group A convey nothing to them but neither does *Str. pyogenes*, whereas the term haemolytic streptococcus is immediately recognized; this is, of course, most undesirable.

With regard to her second point, there is a good deal of evidence to suggest that a person whose throat is clinically normal is not infectious even though *Str. pyogenes* can be cultivated from it. In ordinary practice such persons would be allowed to mix with other people, as is shown by the fact that 80 per cent. of patients who are discharged from fever hospitals are still carrying *Str. pyogenes* in their throats. The fact that a person can carry *Str. pyogenes* without being infectious must be accepted, and the following two examples are of interest, allowing, of course, that one swallow does not make a summer.

Two years ago, during a ward epidemic, the ward sister contracted a clinical tonsillitis due to infection with *Str. pyogenes*, Type 6, a strain which was one of the causes of the outbreak. She was off duty for some weeks, but was allowed to return to work when her throat was clinically normal, although bacteriological examination showed that *Str. pyogenes* was still present. Eighteen months later she was still carrying the organism in her throat, and there had been no cases of Type 6 infection in the interval, and it is the custom in the hospital to swab all cases of colds, sore throats, or septic conditions. It may be stressed that this was in spite of the fact that the ward of which she was in charge was for children.

Some three years ago, in a certain public school, all the boys in one house were swabbed during an investigation, in the course of which swabs from one boy were found to give a profuse growth of *Str. pyogenes*, Type 14. Again routine swabs are done of all colds and tonsillitis in the school, and no cases of infection with Type 14 have been noted, although this boy's swab was still positive two terms later.

We do agree, however, that there is no proven evidence of this fact other than personal observations and experiences, but we hope to be able to add some further knowledge to the subject in the near future. With regard to midwifery practice, where not only is the subject more susceptible but the question of compensation looms largely on the horizon, one cannot afford to risk its being said that a patient has been knowingly exposed to a person who has a swab-positive throat. Dr. Colebrook has, we are afraid, misunderstood exactly what our procedure is. We do recommend the swabbing of all contacts of cases of puerperal sepsis. We do recommend swabbing of all midwifery attendants who have had a cold or sore throat or who have been in contact with a known case of infection of any kind. Finally, we do recommend the swabbing of all midwifery attendants who have a clinically abnormal throat, but we do not recommend the witch-hunting process of the indiscriminate swabbing of persons who, even if found to be positive, we believe to be in ninety-nine cases out of a hundred perfectly harmless.

We believe that persons whose throats show streptococci are not infectious except in the following cases: (1) If there is a chronic focus of infection present, such as an infected sinus or chronically infected tonsils; not all of these are in fact infectious, but the chance in favour of their being so is much greater than in the clinically normal cases. (2) When the person is recovering from a recent infection. (3) When a person is acutely infected. (4) When the person has recently been in

Continuous Intravenous Saline

SIR,—In the administration of continuous intravenous saline a leg rather than an arm is to be preferred as the site of introduction. Unfortunately immobilization of the limb in a rigid splint is frequently badly tolerated by restless patients. By the use of the method described the leg is sufficiently fixed but the patient is as comfortable as may be in virtue of the movement permitted.

The cannula is inserted into the saphenous vein at the ankle. The delivery tube is looped around the foot, being conveniently held by passing it through an interdigital cleft. The whole is maintained securely in position by elastoplast strapping around the foot and ankle. The cannula cannot now be dragged out of the vein. The leg from the knee to the toes is swathed in wool and loosely bandaged. By means of three loops of six-inch bandage the leg below the knee is suspended from a cradle so that it swings free of the bed: the patient is now able to flex and extend the knee and move the limb from side to side. Passive movements of greater amplitude than those possible for the unaided patient are also soothing. To prevent any excessive voluntary flexion a generous length of bandage connects the ankle to the bed rail.—I am, etc.,

GEOFFREY PEBERDY.

Cancer and Vitamin A Deficiency: Geographical Distribution

SIR,—I have studied with great interest the reports and the maps of the geographical distribution of cancer compiled by Dr. Percy Stocks for the British Empire Cancer Campaign (*Journal*, December 11, 1937, p. 1181). I think the whole profession owes a great debt of gratitude to him. His maps show geographical differences which require explanation and variations in site incidence which are puzzling. Some of the North Wales counties have death rates for gastric cancer amongst the highest in the country, and they also have high death rates for tuberculosis and high maternal mortality rates. Is there any factor common to these three rates? I think all those who have studied the question in Anglesey will agree that the prevalent lack of a well-balanced diet is one, if not the main, cause of this state of affairs. In many homes the staple diet is tea and white bread and butter, fresh meat is only sparingly used, the milk consumption is small, and potatoes and some root vegetables are eaten. The most astonishing thing is the almost entire absence of fresh green vegetables and fresh fruit as articles of diet. Dr. Emrys Jones, the tuberculosis officer for Anglesey, giving evidence at the Ministry of Health Commission at Cardiff last week, is reported as stating that in his opinion most of the tuberculosis encountered was due to a lamentable neglect of the nutrition of children. He said that green vegetables were never used in some homes, "they were looked on just as green leaves." My own observations lead me to the conclusion that there is in Anglesey a well-marked deficiency of vitamin A in the diet, and that this is a vital factor in the production of these three high death rates. If this is so we should expect a high incidence of gastric carcinoma, as it has been shown by Roller and Wills that vitamin A is a vital necessity for the normal functioning of the gastro-intestinal tract, and that a deficiency causes degeneration of mucous membranes; it is clear from Dr. Stocks's reports and maps that while the rates for cancer of the tongue, larynx,

tonsils, bladder, and prostate are low in North Wales compared with other areas, the gastric cancer rate is one of the highest in Great Britain. Dr. Stocks does not think this is a racial characteristic, but suggests that dietary conditions may have something to do with it. I am inclined to think that the vitamin A deficiency is a predisposing factor in gastric cancer, and that large quantities of hot tea, taken at very frequent intervals through the day, act as an irritative factor on a debilitated and degenerated mucous membrane.

The similarity between the geographical distribution of cancer and that of tuberculosis is interesting and may be significant, as shown in the work of Stocks and M. N. Karn on the distribution of cancer and tuberculosis in England and Wales. Pearl has demonstrated that there is an antagonism between acute tuberculosis and cancer, so that they hardly ever occur in the same individual. If this is so, why should these two diseases often have high death rates in the same areas? These and other considerations prompt me to make the following suggestions:

1. Dark-adaptation tests should be carried out on a large scale in areas with high death rates from cancer and tuberculosis to prove or disprove the coexistence of a vitamin A deficiency.

2. If these tests show there is such a deficiency, an intensive educational campaign should be conducted in these areas on diet and nutrition, with special reference to the consumption of more milk and dairy products and more green vegetables.

3. The revival of agriculture and market gardening will be necessary to meet these increased requirements.

4. Further dark-adaptation tests should be undertaken at intervals to see if the vitamin A deficiency is made good, and a close study of the rates and distribution of cancer and tuberculosis when the deficiency is lessened should also be made.

J. L. MOIR.

Insulin for Local Sepsis

SIR,—I have read with interest the letters of Dr. R. D. Lawrence (*Journal*, January 15, p. 143) and the late Dr. Otto Leyton (*Journal*, January 22, p. 203) commenting on my results of the local application of insulin. I am well aware that work on the effect of insulin in cutaneous ulceration has been reported abroad, and reference to this was made in my communication, but I have been unable to find any similar records in this country. With the statement that there is nothing to show why insulin should have a local effect I cannot agree. Cohen and Libman (*Quart. J. Med.*, April, 1937, p. 157) in experiments with injections of posterior pituitary extract and glucose show that there is a more marked and prolonged rise in the blood sugar than that following the ingestion of an equivalent amount of glucose alone, and conclude that the posterior pituitary extract antagonizes insulin hypoglycaemia by retarding the peripheral utilization of blood sugar. If, as this tends to show, there is carbohydrate metabolism in remote tissues, it supports the theory put forward in my memorandum that by reducing the sugar content of the area by local application a morbid condition might be relieved. Naturally much research with careful controls is essential before any new treatment can be considered of proven value, but I hope that the encouraging results which have so far attended this therapy will be maintained.—I am, etc.,

London, W.1, Feb. 4.

NEVIL LEYTON.

Reform of maternity work has begun at the wrong end. A great deal of that work—probably 50 per cent. at least—has been taken out of the hands of the general practitioner and has been handed over to less-experienced midwives, with no better results. Maternity work used to be considered the general practitioner's specialty and was the foundation of his practice. What is at fault is the training of the student—the lack of training after graduation. A few years ago I wrote in the *British Medical Journal* that every practitioner who intended to practise midwifery should either have had a term as house officer in a maternity hospital or an assistantship with a practitioner who had a large midwifery practice. This elicited no criticism.—I am, etc.,

Erdington, Birmingham, Feb. 7.

ROBERT ANDERSON.

Expulsion of Placenta Praevia in Advance of Foetus

SIR.—With reference to the recent correspondence on this subject the following case may be of interest.

An eight-months-pregnant Burmese woman, aged 29, who had given normal birth to six children, was admitted to hospital on September 27. The pregnancy had been normal except for slight bleeding for a day in July. On the day of admission pains had begun at 6 a.m., and were accompanied by some haemorrhage. Twelve hours later the placenta was ejected with profuse bleeding. The cord was then tied but not cut, and the patient was removed by bus to a hospital ten miles distant. On the journey the cord snapped, and the placenta was thrown into the jungle by the bus conductor. On admission to the second hospital at 10 p.m. the patient had collapsed and was almost pulseless. Uterine contractions were present and foetal heart sounds absent. Vaginal inspection revealed no bleeding, but there was evidence of recent haemorrhage. The cervix was fully dilated with the head presenting, and an arm and the severed cord prolapsed—an appearance suggestive of a twin labour in which the first child had been born. After catheterization, the administration of intravenous glucose-saline, and amputation of the foetal arm, a dead child was delivered by the breech. Intravenous glycerin, anti-streptococcal and anti-tetanus sera, intravenous calcium and soluseptasine supplemented the usual treatment for shock. The following day a piece of membrane was passed and the general condition of the patient was improved. Later, however, fever developed, and the patient died on the sixth day.

Rangoon, Dec. 1, 1937.

KENNETH LINDSAY.

Technique of Blood Transfusion

SIR.—The article on methods of giving blood transfusion by Dr. H. F. Brewer in the *Journal* of January 29 (p. 241) prompts me to refer to a few practical points.

Apropos of technique, I can only speak from experience of three methods—namely, (a) the funnel gravitation method; (b) Keynes's flask; (c) Jubé's syringe. The first two have been described in detail by Dr. Brewer, but I am unable to agree with his method of using Jubé's syringe, and, I think, it is not the method suggested by the designer.

I have used this syringe (5 c.cm.) on many occasions during the past ten years for transfusion of undiluted blood direct from donor to recipient, and have found it satisfactory in all cases where the donor was of robust type with large veins. I use sterile liquid paraffin to flush out the syringe and fittings and have a second syringe in readiness if necessary. A pneumatic tourniquet is fixed to the arms of both persons, and after infiltration of a small area of skin with 1 per cent.

novocain the largest-size cannula is inserted into the vein of the donor pointing against the flow of blood, and in the opposite direction in the recipient. No incision of the skin is made, as by doing so one loses the natural elastic grip which the skin exerts on a large needle (excepting those frequent cases in which the recipient's vein must be completely exposed, and for these I would recommend the citrate method). The syringe is filled with blood from the donor and the liquid paraffin ejected immediately before the fitting—on the recipient's side—is connected, to avoid any air embolus. The suction and plunging movements of the syringe must then be carried out as quickly as possible, when it will be found that 250 to 300 c.cm. of blood can be given within five or six minutes. The only difficulty I have encountered is clotting in the needle of the recipient, but this does not usually arise until about fifty syringefuls have been administered. This method is perhaps difficult to begin with, but, like most operations, technique improves with experience. In practised hands I believe it is one of the best methods at our disposal for the repeated administration of blood, and this can be taken from the same donor—a valuable consideration when one has not an organized team of donors to draw from.

For those who are only called on to carry out blood transfusion infrequently I would recommend Keynes's flask, using citrated blood, or a flask and a three-way 50-c.cm. syringe (specially made for the purpose). The disadvantages of the citrate method are: (1) It is not an infallible remedy against clotting. (2) Exposure to air destroys some of the blood platelets—a serious matter in purpuras and certain forms of anaemia. (3) There is greater risk of contamination. (4) Reactions appear to be more frequent after using citrated blood.

With regard to the typing of blood it is not necessary to use any stock grouping sera and it is not advisable (as Dr. Brewer points out) to depend on this test alone. The best practical results will be obtained by testing the serum of the recipient against the corpuscles of the donor, and it is also advisable to test the serum of the donor against the corpuscles of the recipient. By this method the presence of minor agglutinins in the respective sera can be detected and the possibility of subsequent reaction in the patient further eliminated.

We are all agreed on the value of blood transfusion, even though we may differ slightly on the indications. Out of four cases recently treated in hospital (diagnosed as secondary anaemia and debility) three had 20 per cent. haemoglobin and one had only 15 per cent. (Haldane's method). None of these patients received a transfusion, although it was indicated in all, owing to the failure to obtain donors. The patients themselves made a fair recovery, though this was naturally slow and prolonged. The point, however, I wish to stress in referring to these cases is that it is difficult to decide when a transfusion becomes "imperative," and it may be of interest to some readers to know that a patient with secondary anaemia, a haemoglobin of 15 per cent., and red cells 1,280,000 per c.mm. could even exist.

The fact that patients so seriously ill in a Poor Law hospital did not receive a blood transfusion elicits the question, Why? The answer is simple: Donors could not be procured. This is a matter which might receive attention from the Public Health Department. Pending the advent of an organized scheme I am afraid that such a valuable remedy as blood transfusion will continue to remain a privilege for the minority of our sick population, and, as a therapeutic measure, will still be conspicuous by its absence in the practice of Poor Law and other hospitals.—I am, etc.,

J. F. O'CONNOR, F.R.C.S.I.

Limerick County Hospital, Feb. 7.

could ring up relatives four counties away (telephone number and exact name not known) to ask permission for the anaesthetic before doing anything else.

Lest Mr. Clarke should fear that I have hindered the flow of patients through what he would consider the proper channels, I would hasten to point out that on the slightest pretext I attempt to throw the burden on to the broad, competent, and obliging shoulders of my surgical colleagues—whatever happens I want my alibi watertight. In spite of my lack of special training, my judgment is extraordinarily good, because not once have I heard a surgeon complain that the condition was too trivial to benefit from his wide experience, or that I should have sent it back to be dealt with by the general practitioner; in fact I have always been given to understand that he was just the man for the job.—I am, etc.,

February 9.

B.M./MC5W.

A Word of Caution

SIR,—The Council of the Medical Defence Union is somewhat disturbed at the continuing volume of requests it receives for advice and assistance from practitioners who have entered into contracts with a body known as the Consolidated World Research Society Limited. On a previous occasion a report appeared in your columns (February 13, 1937, p. 337) as to certain action taken by our solicitors arising from representations made to a practitioner on completion of a contract with the above-mentioned society. Perhaps it would be useful to quote a few sentences from that report:

In December last the Consolidated World Research Society Limited instituted proceedings against a medical man practising in Sussex claiming the sum of £18 said to be due under a contract signed by this doctor for the supply of the *Consolidated Encyclopaedia*. The conduct of the defence was assumed by the Medical Defence Union, and a defence was filed repudiating liability on the ground that the defendant had been induced to enter into the contract "by fraud and wilful misrepresentation by the plaintiffs' representative." A few days before the date for the hearing notice was given on behalf of the plaintiff of the withdrawal of the claim.

Members of the Medical Defence Union are requested to communicate with its Secretary before entering into any contract with the Consolidated World Research Society, whilst, at the same time, it would be desirable to indicate the scope and character of the representations made by any representative employed by the above society when canvassing on its behalf.—I am, etc.,

ROBERT FORBES,
Secretary.

49, Bedford Square, W.C.1.

Universities and Colleges

UNIVERSITY OF CAMBRIDGE

A public lecture will be given in the Physiological Department on Monday, February 21, at 5 p.m., by Professor Simon Flexner, formerly director of the Rockefeller Institute for Medical Research. His subject is epidemic poliomyelitis and epidemic encephalitis.

During the month of January titles of the degrees of M.B., B.Chir. were conferred by diploma on A. C. Clark and V. E. A. Sykes (Newnham College), and of M.B. on G. E. Grove (Girton College).

The following candidates have been approved at the examination indicated:

DIPLOMA IN MEDICAL RADIOLOGY AND ELECTROLOGY.—Part I: F. Bush, S. J. H. Douglas, Heather D. Dowling, T. Fichardt,

Kathleen M. Henderson, T. H. Hills, F. B. Kiermader, O. C. Levine, K. Lumsden, R. L. Mansi, A. M. Mansour, J. Morton, R. S. Padaki, C. N. Pulvertaft, S. J. R. Reynolds, Alice M. Ross, A. Smeravuta, C. G. Talwalkar, S. Li Din H. El Taoudi, W. E. McL. Topping, L. Werbeloff, M. A. A. Zohdy.

UNIVERSITY OF LONDON

UNIVERSITY COLLEGE HOSPITAL MEDICAL SCHOOL

The Sydney Ringer Memorial Lecture will be delivered by Professor J. H. Gaddum at University College Hospital Medical School, University Street, Gower Street, W.C., on Tuesday, March 8, at 5 p.m. His subject is "Ephedrine." The chair will be taken by Sir Henry Dale, F.R.S., and the lecture is open to all qualified practitioners and medical students.

Amendment of Regulations

Amended regulations for the Academic Postgraduate Diploma in Public Health (*Red Book*, 1937-8, pp. 649-52) have been approved for examinations in and after 1939. Copies may be obtained from the Academic Registrar, London University, Bloomsbury, W.C. Revised regulations for the External Diploma in Public Health have been approved, and will be published in the *Blue Book* in September.

Appointment of Representatives

Mr. John Fawcett, F.R.C.S., has been appointed governor of Allen's College, Dulwich, in the place of the late Sir Andrew Taylor, and Professor W. W. Jameson representative of the University at the Health Congress of the Royal Sanitary Institute at Portsmouth, July 11 to 16.

UNIVERSITY OF DURHAM

At its meeting on February 11 the Senate conferred the title of Emeritus Professor on Professor H. J. Hutchens, M.R.C.S., L.R.C.P., D.P.H., on the occasion of his resignation from the Heath Professorship of Comparative Pathology.

UNIVERSITY OF SHEFFIELD

At its meeting on February 11 the University Council received notification of payment by the Sheffield City Council of £11,998 as grant to the Faculties of Arts, Pure Science, Medicine, and Law for the year ending March 31.

A special degree congregation will be held on Monday, March 21, at 3 p.m.

ROYAL COLLEGE OF SURGEONS OF ENGLAND

A meeting of the Council was held on February 10, with the President, Sir Cuthbert Wallace, Bt., in the chair.

The Hallett Prize was presented to Bertram Alfred Edward Johns of Birmingham.

Diplomas

Diplomas of Fellowship were granted to Frederick Charles Durbin of St. Thomas's Hospital and Denis Frederic Elison Nash of St. Bartholomew's Hospital.

Diplomas of Membership were granted to the 159 candidates whose names were given in the report of the meeting of the Royal College of Physicians of London published in the *Journal* of February 5 at page 317; as were the names of the twelve candidates who have been granted Diplomas in Public Health, and the names of the four candidates who have been granted Diplomas in Tropical Medicine and Hygiene.

Diplomas in Medical Radiology were granted, jointly with the Royal College of Physicians, to D. M. Harper, T. Lodge, and J. T. McGinn.

It was reported that at the recent Primary Fellowship examinations held over-seas eleven candidates out of seventy-six were successful in India and five out of fifteen in Cairo.

Mr. Eardley Holland was reappointed to represent the College on the Central Midwives Board, and Mr. Sampson Handley and Mr. Graham Simpson were appointed to represent the College on the Committee on the Geographical Distribution of the Industrial Population.

Museum Demonstrations

A course of museum demonstrations in the theatre of the College begins on February 28, when Mr. L. W. Proger will show new specimens. Mr. Proger will repeat this demonstration on March 7 and 14. On March 4 Dr. A. J. E. Cave will speak on anatomy of the tongue, on March 11 on anatomy of the diaphragm, and on March 18 on anatomy of the skin. All the demonstrations commence at 5 p.m., and are open to advanced students and medical practitioners.

Two Unusual Cases

SIR,—The following two cases may be of interest, as they present somewhat unusual features.

CASE I

A nurse, aged 22, had been nursing a case of shingles for two or three weeks when a neuralgic pain began in the neck. Shingles appeared on December 7 and she came to me on December 9. She then had a massive infection of the right side of the neck, the whole area supplied by the third (or is it the fourth?) descending cervical nerve being involved. Fortunately the area was a small one, as it was impossible to put a threepenny-bit (old style) on it without overlapping a scar. On December 13 she came out in a typical chicken-pox eruption, distribution and character being absolutely according to the book. As she had a pock on her soft palate and another by the inner canthus of her left eye her discomfort was complete. The pain from the shingles was bad but not too severe. The last pock came off on December 30, but her shingles did not clear up till January 8, leaving her neck very badly scarred.

On December 7 the younger sister of the patient developed chicken-pox, which ran a perfectly normal course, but the family let me down: they none of them developed shingles. The younger girl's infection traced back to her sister's shingles, as a reference to the dates will show.

I suppose every practitioner of experience has seen cases of shingles following chicken-pox and the reverse, but this is my first experience, after thirty-five years of it, of the two occurring in the same patient at the same time. I have frequently noticed that these massive cases of shingles are not as painful as one would expect. Also I have used pituitrin for some time now and find that in most cases it acts like a charm, the only exceptions being three which had a chicken-pox complex. I wonder if this has been the experience of others.

CASE II

A married woman, aged 76, had a ruptured gall-bladder removed some four years ago. On her return from hospital she showed a definite Stokes-Adams syndrome: blood pressure 220/120, pulse rate 50. She was able to carry on her light duties about the house, take short walks, and altogether enjoy a fair measure of comfort. I was constantly in the house and her pulse never varied. In the beginning of November, 1937, she developed bronchitis, which slowly cleared up without causing undue trouble and without altering the cardiac condition, which remained typical. On December 8 I was sent for and found her sleepy and stupid; blood pressure was 300+/145 and pulse rate 32. As neither of my instruments will register more than this, and as her heart-beats were still coming through gaily, I cannot give her actual systolic pressure. The next day her blood pressure was down to its old figure (220/120), but her pulse continued at 32. On the morning of December 14 a scared night nurse looked in on her way home to say that she could not make the pulse more than 22 at the wrist. This I confirmed shortly after and proved it by the stethoscope over the jugular. We were getting it all at the wrist. The rate remained the same all day, my last visit being about 9 p.m. The next day it had risen to 28, and oscillated between 28 and 32 till the Friday. Her blood pressure did not vary from the 8th. On the Friday (December 17) she was unconscious; blood pressure was 155/95 and pulse rate 85. On Saturday she was quite conscious and placid but sleepy; blood pressure was 220/120 and pulse rate 50. On Sunday she was again unconscious, and by the Tuesday her blood pressure had dropped to 95/0 and her pulse rate risen to 145. She died that afternoon.

I have had a pulse rate of 32 before in a man whose pulse pressure was too high for my instrument, but I have never heard or read of a pulse rate of 22. The other interesting point seems to me to be the return to consciousness on December 18, coincident with the rise in blood pressure and drop in pulse rate.

—I am, etc.,

Clevedon, Somerset, Jan. 29.

R. STUART RENTON, M.D.

The Radiologist's Range of Service

SIR,—In your issue of February 5 Mr. H. Osmond Clarke says:

"All fractures require treatment, and the appropriate treatment for any individual fracture can be determined only by the experienced surgeon who has before him all the facts, clinical and radiological."

The statement is clear. It means that the general practitioner must never treat a fracture, except with the assistance and advice of a consulting surgeon. But do general practitioners in fact accept this doctrine—or are they likely to within any predictable future? If they do not, two courses are open to them: (1) To decide entirely on their own responsibility whether or not to call in a surgeon. (2) To talk over the matter with a radiologist in whom they have confidence, and thus to receive some help in reaching a decision.

Which of these courses is the better? I leave it to your readers to judge. I must, however, protest against any attempt on the part of one specialty to lay down rules as to what may or may not lie within the province of another specialty. Radiologists are determined that they themselves shall decide what work they may usefully undertake, what advice they may give. They are constantly striving to reach a standard of professional qualification such as shall not be exceeded by specialists in any other branch of medicine. Hence the institution of a higher diploma in radiology, with a physician, a surgeon, and a pathologist on the board of examiners.

If radiologists are wrong in these ideas—if the profession at large does not appreciate their efforts at acquiring a wide clinical training—then the attempt will fail, and the remnant that are left will become "hewers of wood and drawers of water" to those who have been wise enough to choose a real specialty.—I am, etc.,

London, W.1, Feb. 11.

F. HERNAMAN-JOHNSON.

SIR,—Knowing as he does that broken bones contain only black ingratitude, I am sure that no radiologist wishes to be connected in any way with the treatment of fractures; he has so many worries of his own that he grasps with alacrity at any opportunity of disclaiming responsibility for the misfortunes and mistakes of others.

However, Mr. H. Osmond Clarke in his letter (*Journal*, February 5, p. 310) claims that the radiologist has not the wide experience to enable him to speak with authority on clinical end-results. I would like to point out that in fact a radiologist does see patients at all stages, and that he sees (assuming he is single-handed) at least as many films as the rest of his hospital staff put together, and, supposing that he has any intelligence at all, he gets a very good idea not only of the efficacy of various surgical performances but also of the judgment and ability of the surgical performers. He could quote the odds, for instance, fairly accurately against Mr. X. getting a Smith-Petersen pin of the correct length anywhere near the head of a femur, or against Dr. Y. getting any lipiodol into a chest at all.

I find that I am frequently asked not only to decide if "competent surgical advice" is indicated, but to choose and therefore be responsible for a nursing home, book a bed suitable to the patient's medical and financial condition, recommend, locate, and arrange with a surgeon, and possibly an anaesthetist, unless I can manage to fix the operation for 7 to 8 p.m., in which case the referring doctor could give the anaesthetic, and, if this is possible perhaps I would leave a 'phone message at the "Dog and Duck" before 4.30 p.m., when he will be calling there. Incidentally everyone would be very much obliged if I

lights only three were affected with nystagmus, and these had always used candles. In strong contrast to this, out of 524 men using safety-lamps 164 were affected. There was not a single case in torch-lamp pits among those men who had always used torch-lamps. He therefore looked upon the cause of the trouble as being essentially the insufficient light of a safety-lamp, which threw shadows and tried the eyes severely. When the light was improved, as by the use of a candle, the disease became rarer, and in the light of a torch-lamp giving two and a quarter times that of a candle (which he held was the best light of all) there was no disease. The difficulties in getting good light at a coal face, the black surface of which does not reflect rays but absorbs so very many of them, may be seen from the following observations. The average illumination at the coal face in safety-lamp pits was 0.018 of a foot-candle, in candle pits 0.09; while the smallest illumination which would enable a seamstress to work with black velvet, which absorbs about 97 per cent. of all incidental light, without experiencing discomfort was very much greater. Court took part in a discussion on the subject at the B.M.A. Annual Meeting at Nottingham in 1892, and his important contribution to this appeared in the *British Medical Journal* with those of other observers. In the better-lighted mines of recent years the trouble is not so often met with, but it is still a frequent cause of claims made under the Workmen's Compensation Act.

Court was naturally interested in the threatened invasion of our coal mines with the *Ankylostoma duodenale* of warmer climates. A grave outbreak of this occurred in the chief tin mine of Cornwall at Dolcoath, which was investigated by Haldane and Boycott in 1903. The hookworm also appeared in some Scottish pits. Court wrote a paper in the *World's Work* of the same year on "A New Form of Disease amongst Miners." This gave some account of the distribution of the disease, its main symptoms and the best methods to adopt in its prevention.

H. W. P. sends the following note:

By the death of Sir Josiah Court the Association loses one of its most distinguished general practitioners, and the members of the Derbyshire Branch their oldest and most venerated colleague. Josiah Court was born at Warwick the son of a chemist but of yeoman farmer stock. Through his grandfather, of Charlecote, near Stratford-on-Avon, he could trace descent from Richard Courte, a contemporary of Shakespeare's father. Indeed, the records of the town of Stratford show how the Courtes and the Shakespeares in the time of Elizabeth were associated as aldermen of that borough. Educated at King Henry VIII School at Warwick, Court, at the age of 14 years, entered the offices of a shipping firm in Liverpool, where he stayed for three years. Here he met and began a lifelong friendship with another boy clerk, who subsequently became Sir John Brunner, the founder of the famous chemical firm of Brunner, Mond and Co. At the age of 17 Court decided to enter the medical profession, and was sent to the Sydenham College of Medicine, Birmingham, associated with the old General Hospital, both long since demolished. At the hospital he held the position of resident medical assistant and afterwards moved to Guy's, where he completed his curriculum and qualified.

In 1864, a young man of 24, he bought a practice at Staveley in Derbyshire, and there he was destined to stay for seventy-three years. In his early days there Staveley was a place of green fields and woodlands, and Court led the life of an ordinary general practitioner of the period.

Travelling on horseback or in an old-fashioned gig he covered many miles a day, and his work was general enough for the most general of general practitioners. Medicine, midwifery, and surgery, minor and major, occupied his time. It was before the days of Listerism. Nurses were scarce or unavailable and ambulance and hospital facilities inadequate. Such major operations as amputations and trephines were done in cottages, on kitchen tables, and, as Court used to say, the results were quite good. For over fifty years he gave ungrudging and devoted service to the community. No one was too humble or too poor to claim his help and ready sympathy; no trouble among his people too small to secure his interest and assistance. His humour, his common sense, his outspokenness and sincerity, his hatred of sham and pretence endeared him to all. The great assemblage at his funeral at Staveley was only a slight token of the position he held in the hearts of all, from the Lord-Lieutenant of the county to the humblest worker in the pit. His interests were many and varied. Birds, dogs, and children had his special affection, and his recreations were fishing and shooting. He was a crack rifle-shot, and in 1880 won the Robin Hood Cup at Wimbledon with seven bulls out of seven shots at 200 yards. In 1874 he was mainly responsible for the formation of the Staveley Rifle Volunteer Company and was gazetted captain. In politics he was a strong Conservative, though his independent spirit never allowed him to submit to dictation from party wire-pullers. He was chairman of the local Conservative Association in 1868, and in subsequent years. On six occasions he contested the North-East Derbyshire Parliamentary seat without success; Liberalism at first, and then Labour, in the constituency were too strong for him. Yet in 1895 he reduced a majority of 2,170 to 527, and in 1900 to 268. This, under the circumstances, was a triumph; as the miners said at the time, "Nobbut 't'owd Doctor could 'a' done it." A strong and sincere Churchman, his private benefactions to Church and people were many. During his ninety-first year he walked to church on fifty-two successive Sundays. Up till the same great age, too, he was to be seen week after week attending the open-air services of the Salvation Army in the main street of Staveley. In 1901 he was made a Justice of the Peace for Derbyshire, and in 1920 received the honour of knighthood.

In the medical profession he will be chiefly remembered for his researches into the causes of miners' nystagmus. Among the offices he held was that of consulting surgeon to the Derbyshire Miners' Association, and at the request of that body he undertook the task of inquiring into the question of nystagmus. In the course of his investigations in 1890-1 Court descended numerous pits in Derbyshire, Durham, and the Forest of Dean, and also, abroad, in Belgium, and personally watched the miners at work under varied conditions of lighting, etc. His inquiries covered the cases of no less than 1,400 miners, working with safety-lamps and naked lights. In May, 1891, he unequivocally reported to the Miners' Association that in his opinion the cause of the condition was the defective lighting in the pits. He had received some help in the inquiry from a Dr. Pegler of Stonebroom, Alfreton. It is difficult for us to-day to realize the bitterness of the controversy which arose. The writer, at that time house-surgeon to a famous ophthalmologist, Priestley Smith, well remembers the disturbance which followed. Professional opinion as expressed by Simeon Snell of Sheffield was that "the chief cause is not the safety-lamp, but the position in which the men work." In July, 1892, Court read a paper at the B.M.A. meeting in Nottingham. He

Obituary

SIR F. TRUBY KING, C.M.G., M.B.

Formerly Director of Child Welfare, Dominion of New Zealand

We regret to announce the death on February 9, at Wellington, New Zealand, of Sir Truby King, whose name and teaching are known all over the world through his books *The Expectant Mother*, and more especially *Feeding and Care of Baby*, which is the official handbook of the many Truby King and Mothercraft Training Societies.

Frederic Truby King was born in 1858 at New Plymouth, New Zealand, the son of Thomas King, and studied for the medical profession at the University of

Edinburgh, where he graduated M.B. and was awarded the Ettles Scholarship. Before deciding to make medicine his career he had worked with growing reluctance as a bank clerk in New Zealand. After graduation he spent two further years at Edinburgh, studying preventive medicine, and was one of the first to take the degree of B.Sc. in Public Health. He then held resident posts at the Edinburgh and Glasgow Royal Infirmaries, and returned to New Zealand in

1888, becoming superintendent at Seacliffe Mental Hospital and lecturer on mental diseases in Otago University. In 1907 he founded the Royal New Zealand Society for the Health of Women and Children, which was later named the Plunket Society because of the interest taken in the movement by the Governor, Lord Plunket, and his wife. For thirty years the society and its nurses have followed Truby King's teaching as closely as possible and have spread his doctrines far and wide. Between 1907 and 1928 the infant mortality of the Dominion was halved, and there was a notable improvement in the health of mothers before and after childbirth. In 1913 Truby King visited this country as delegate from New Zealand to child welfare conferences in London, and in 1917 he accepted an invitation to organize work here on corresponding lines; thus was established the mothercraft training centre in Trebovir Road, Earl's Court, and similar centres have arisen in every English-speaking country as well as in other parts of the world, their common aim being to practise and teach the principles laid down by the founder. In 1919 he toured Australia with a view to establishing welfare centres there, and he paid three more visits to England. Now nearly 800 nurses hold the certificate of the Mothercraft Training Society at Highgate, and there are six branches in London and the provinces. From 1921 to 1927 Truby King was Director of Child Welfare in the Department of Health of the Dominion of New Zealand. He had been created C.M.G. in 1917 in recognition of his pioneer work in infant welfare, and received a knighthood in 1925. The American Pediatric Society made him an honorary member.

Sir Truby King had been a member of the Wellington Division of the British Medical Association for more than thirty years. An excellent account of his methods of

infant feeding and management will be found in Dr. Reginald Jewesbury's *Mothercraft, Antenatal and Post-natal* (1932), of which a new edition has lately appeared. Public tributes to his fruitful enthusiasm for infant welfare have been paid by the Prime Minister of New Zealand, Mr. Savage; and the Dominion Government has accorded him a State funeral.

SIR JOSIAH COURT, J.P., M.R.C.S.

Sir Josiah Court, who died on February 8 at Staveley, Chesterfield, aged 97, was a general practitioner in a colliery area, who, in the face of strenuous and not always agreeable opposition, established the position of miners' nystagmus as due mainly to the lighting of the mines and not to the posture of the men while at work. He had long been the senior member of the British Medical Association in Derbyshire, having joined the Chesterfield Division more than sixty years ago. At the Annual Meeting of the Association at Newcastle-upon-Tyne in 1921 he was vice-president of the Section of Preventive Medicine with Industrial Diseases.

Josiah Court was born on January 17, 1841. He qualified to practise with the M.R.C.S.Eng. in 1863; two years later he became L.R.C.P.Lond., and after acting as assistant medical officer at Guy's settled in practice. In time he became a leading practitioner at Staveley, and filled many official posts there. Over his many years of busy life he was consulting surgeon to the Derbyshire Miners' Union for claims under the Workmen's Compensation Act, surgeon to the Great Central Railway at Staveley, certifying factory surgeon, public vaccinator, and medical officer of health. As surgeon to the local miners' association he gained first-hand acquaintanceship with the diseases incidental to that occupation, and became well known at home and abroad for his study of miners' nystagmus.

As long ago as 1832 miners were known to have trouble with their eyes and heads which in time disabled them from working in a mine. It was more fully recognized and described by a Sheffield doctor in 1854. The first case recorded in literature occurred in Belgium. The eye muscles were described as being overburdened from continued effort in a deficient light. Thenceforward the disease received much more notice by mine doctors, and the awkward position assumed by the miner hewing at the coal face was looked upon as contributing to its cause. Many observers have written about nystagmus since then, additional symptoms have been described and varying causes assigned to it.

Dr. Court came into the records and discussion of the disease in 1891 and subsequently by writing several papers on it. A lengthy report was then prepared by him for the Derbyshire Miners' Association, and in 1920 his papers on miners' diseases were collected and published by the *Sheffield Daily Telegraph*. By careful observations he showed that nystagmus was common in fiery mines where the safety-lamps must be carried but rare in mines where there was no gas and in which naked lights were used. He found that out of 573 miners using naked

echoes of Stevenson's "Christmas Sermon." I have associated much of it with my old friend Stewart—he is a war-worn veteran who laid down his arms without dishonour, yet hardly had the barrack gates clanged behind him than his strength failed. His steps faltered literally on the day of his release from service. His joy of life might have afforded him a lot of happiness, but if the pleasures of leisure have been denied him its pains have not been experienced. As a loyal friend and as a trusted and loved doctor he will be greatly missed both in public and private life.

Dr. PERCY COLEMAN, who died at Clacton-on-Sea on February 4, studied medicine at St. Thomas's Hospital and at Newcastle-on-Tyne, qualifying M.R.C.S., L.R.C.P. in 1890 and taking the M.B., B.S. of Durham University in 1892. Before settling in practice at Clacton he was house-physician at the Middlesex Hospital and house-surgeon at the Colchester Hospital. In 1899 Dr. Coleman joined the staff of the newly built Clacton and District Hospital, and was for many years chairman of its board of management: in 1929 he was presented with his portrait in oils, with an album containing the names of 335 subscribers and a wallet containing the residue of the testimonial fund. Dr. Coleman was also for many years medical officer to the Middlesex Hospital convalescent home at Clacton and to the Essex and East Counties Asylum convalescent homes. He had been a member of the British Medical Association for forty-four years, and was chairman of the North-East Essex Division in 1924-5.

A HOSPITAL CLEARING HOUSE

A scheme to centralize the arrangements in London for the admission to hospitals of emergency and acute cases is on the point of completion. The co-operation of the hospitals likely to be affected has been secured, and King Edward's Hospital Fund has promised a substantial donation towards the cost. The task of bringing the proposal into practical shape has been that of a sub-committee of the Voluntary Hospitals Committee of the County of London, which is the body set up under the Local Government Act, 1929, for consultative purposes with the local authority regarding hospital provision. It is proposed to set up a central office where a record of beds available at voluntary hospitals will be maintained, and practitioners who desire cases admitted will be encouraged to refer by telephone to that office instead of directly to the hospitals. Practitioners will not, of course, be precluded from making direct application to a particular hospital, and the choice of hospital will be left, as at present, to them; but it is felt that a centralized system will avoid frequent delay and disappointment by discovering at once where beds are available and where they are not, and will also save the time of hospital officers. One necessary step will be to have the admission of cases controlled by only one office in each hospital, so that the clearing house will not have to make inquiries from different sections in turn when applying for a bed. This arrangement, simple as it seems, is said to necessitate quite a considerable amount of reorganization in some cases.

Extensions and Improvements

The latest report of the Voluntary Hospitals Committee, although not concerned with hospital finance, does not seem to reflect the rather dreary picture of the future of voluntary hospitals which has been painted in the correspondence columns of some newspapers. The voluntary hospitals within the county of London number 105, with 16,113 beds, an increase of nearly 1,000 beds upon the figure for 1931. Westminster is erecting a new and enlarged hospital at some distance from its old building; Great Ormond Street is rebuilding on its present site;

St. Bartholomew's is reconstructing section by section behind its existing façade; and the rebuilding of St. George's will be undertaken shortly. Extensive programmes, including the provision of pay-beds for middle-class patients, are in hand or have recently been completed at eight other general hospitals, five more are building new out-patient departments, and much other reconstruction and enlargement is proceeding. All these proposals as they come along are referred by the committee to the London County Council for its observations. One instance of such consultation is mentioned in the case of the London Fever Hospital, which is building an isolation block. The authorities of that hospital approached the committee and asked whether, in view of the provision made by local authorities for fevers, it was considered that the hospital fulfilled a useful purpose within the voluntary system. The question was gone into carefully with the London County Council, which took the view that the services rendered by the London Fever Hospital should be regarded as complementary to its own. The conclusion has been arrived at that the hospital does serve a useful function, and the erection of the isolation block is accordingly proceeding. The hospital programme of the London County Council is also continually expanding. In its general hospitals it has 17,534 beds, and in its special (including fever) hospitals it has 14,136, but extensions are in progress which will increase the total by a further 1,834. The more important of these extensions are at Lambeth, Mile End, Paddington, and St. Nicholas (Woolwich) general hospitals, and the North-Eastern Fever Hospital. A scheme is also in preparation for a new general hospital of 500 beds on part of the site of St. Benedict's, Wandsworth.

A New Contributory Scheme

A matter which has received the attention of the committee is the inadequacy of payments frequently made by provincial contributory schemes to London hospitals treating their patients. Some schemes were found to be paying only 3s. per in-patient day, or even less. As a result of representations a great improvement has lately taken place. It is stated that a contributory scheme is likely to be launched early in 1938 with a basis of contribution of 6d. a week, and income limits of £5 a week for single persons, £7 for married couples, and £8 for married couples with dependants. The corresponding income limits recommended by the British Medical Association, subject to economic and local variation and periodical revision, are £4, £5, and £6. The scheme is put forward by the Advisory Hospital Committee of the Hospital Saving Association. The Voluntary Hospitals Committee has been considering hospital insurance for the middle classes, or at least for persons of moderate means but above the usual income limits, and has had some discussions with the British Provident Association, but the proposed raising of the Hospital Saving Association limits brings a new factor into the situation.

The Voluntary Hospitals Committee at present represents only the voluntary hospitals within the county, but it is proposed to extend its constituency to an area corresponding to that of the King's Fund. The extension to a radius of eleven miles from St. Paul's will bring in forty-two additional hospitals with nearly 3,000 beds. London for hospital as for other purposes can no longer be considered as confined within the county boundary.

A new periodical dealing with research in rheumatism with the title *Zeitschrift für Rheumaforschung* will be published this year in Germany by Theodor Steinkopf of Dresden. It will deal particularly with the medical and sociological aspects of this disease, and is intended to help in the campaign against rheumatism by bringing together information derived from various sources. It will be edited by Dr. P. Köhler of Bad Elster, Professor R. Jürgens and Dr. H. Kaether of Berlin.

was supported by Tatham Thompson of Cardiff, but all the other ophthalmic specialists present were opposed to him. It is on record that so violent was the controversy that after the meeting one well-known ophthalmologist declined to travel home in the same compartment as Court. In strong opposition, too, were the mine inspectors, who feared the adverse effects of Court's suggestions on the introduction of safety-lamps into "gassy" pits, and the owners, who were apprehensive of the expense entailed by a more efficient method of lighting. But Court went on with his work, and gradually professional opinion veered round in his favour. In February, 1922, J. S. Haldane and Llewellyn read a paper before the Royal Society endorsing Court's views, and in the following July he finally triumphed, when, at the Ophthalmological Congress at Oxford, after he had read his paper, it was resolved: "That the character of the illumination is the chief factor in the production of coal miners' nystagmus." The importance to the mining industry of his research can hardly be overestimated. No longer can it be held that miners' nystagmus is an inevitable corollary of the industry, but, on the contrary, it is clear that, given proper precautions, it is almost entirely preventable.

A. E. HODDER, D.S.O., M.A., M.B.

Dr. Andrew Edward Hodder died at his home in Stafford on February 3, aged 62. A native of Dulwich, he was educated at Bedford School, from which he proceeded to King's College, Cambridge, gaining the Vintner Exhibition and graduating in Arts in 1898, with second-class honours in Natural Science, and in Medicine in 1901. After qualifying he held the appointment of house-surgeon at his old hospital, St. Mary's, Paddington, and later practised for several years in Lancashire. He settled in Stafford in 1911, and was appointed to the Staffordshire Insurance Committee as a representative of the Minister of Health in 1913, in the same year being made a member of the Panel Committee. He later served as chairman of the Insurance Committee for several years, and in 1927 succeeded the late Dr. Ridley Bailey as chairman and honorary treasurer of the Staffordshire Panel Committee, holding these offices, together with that of chairman of the Medical Benefit Subcommittee, at the time of his death.

Dr. Hodder from his earliest days took an active interest in the service of his country and joined the school Cadet Corps, the Volunteers, and the Territorial Army. Proceeding to France as captain in 1915 with the Third North Midland Field Ambulance, his brilliant work in the field gained him rapid promotion, and in 1917 he was given command of the Ambulance, with the rank of lieutenant-colonel, and was awarded the D.S.O. On his return to Stafford after the war Dr. Hodder continued his public activities. He was a Governor and for some years chairman of King Edward VI Grammar School, a Governor of the Girls' High School, and for a period a member of the Town Council, doing valuable work on the Health Committee. He was also chairman of the Stafford Branch of the English Association, a member of the Staffordshire Nursing Association, and a vice-president of the Stafford Cripples' Centre. He took an active part in the modern development of orthopaedics. Dr. Hodder was an active and staunch member of the British Medical Association for thirty-three years and secretary of the Walsall and Lichfield Division in 1922, a member and past-president of the North Staffordshire Medical Society, and a foundation member of the Mid-Staffordshire Medical Society, of

which he was elected president last October. For many years he was also a member of the honorary staff of the General Infirmary, Stafford, first as anaesthetist and later as physician. He leaves a widow and four children.

Even a mere catalogue of a man's activities may give some indication of his character. Hodder, by culture, temperament, and experience, made an ideal chairman. He held the balance of debate with an even poise and had the gift of seeing the other man's point of view; but amidst his various interests one stood out above all others—his efficiency in his daily job. He had a high sense of the dignity of general practice, and while he made full use of the modern methods of diagnosis he regarded the clinical acumen of the family doctor as the final arbiter. He took an active part in preventive medicine, and on more than one occasion acted as liaison officer between the Public Health Service and other branches of medicine.

Hodder had a high code of ethics. He had few dislikes, but to him all forms of pedantry and ostentation were taboo. His services on the Insurance Committee were particularly valued; for while he took every reasonable care to safeguard the interests of the profession, his impartiality and experience were recognized by those representing other interests, and, as the clerk of that committee has expressed it, "He could make the intricacies and difficulties of medical practice plain to all." When all has been said and written concerning Hodder's qualities and achievements, those who knew him best will also cherish the memory of a loyal friend.

Dr. Frank Bryan writes from Tavistock:

His indeed was a sterling character. He came up to King's, Cambridge, about a year older than most of his intimate friends, and, because of this and the solid worth of his common sense and keen sensibility, he greatly endeared himself with a happy fraternity in which were representatives graduating for the Services and all the various professions. His loyalty and steadfastness to those early friendships was continued to the end, and even in the trying days of the great war he found time to keep in touch with some of us away on other fronts and some at home. Not only was he the centre round which friendship for himself revolved, but through him in large part was maintained the friendship of many other of his contemporaries one with another. So much was this the case that he was affectionately known to us all as "Pa Hodder." We all valued his opinion, and he never failed to be anything but absolutely conscientious with his advice to us, just as I am sure he ever was with his patients.

Dr. R. Stirling sends the following tribute to the late Dr. C. PARKER STEWART: The character of the man is my concern. Let it suffice to say that he obtained first-class honours at Edinburgh University in many subjects and also B.Sc. in Public Health. He finally selected public health as a career. His abilities and dexterous fingers early qualified him for any branch of medicine or surgery he chose to adopt. He certainly was a man of more than average ability, full of resource and energy. After a few years of hospital life and in general private practice he gained a clinical knowledge which later proved invaluable in his work as medical officer of health. His interests were too varied to allow him to drift into a narrow groove, and he never became purely an administrator. He brought to bear human sympathetic understanding in all he did. In no department did he show his originality and success more than in the creation of the Perth child welfare centre, which will remain a model worthy of imitation for many years and a lasting tribute to his memory. My thoughts are still lingering with the

that if there was a successful appeal he thought the general damages would be £200 and the special £72 10s. Every surgeon knows how easily infection can track up a metal wire which pierces the tissues, and a major operation may well lower the general resistance to infection. The learned judge's finding seems by far the most likely explanation of the mishap.

Medical Notes in Parliament

The Divorce and Nullity of Marriage (Scotland) Bill was down for consideration in the House of Lords this week.

The business of the House of Commons included the second reading of the Housing (Financial Provisions) Bill and the National Health Insurance (Amendment) Bill, as well as later stages of the Blind Persons Bill and the Population Bill.

The report of the inquiry into the recent outbreak of typhoid fever at Croydon was issued to M.P.s on February 14 (see p. 404). No immediate request was made for a debate on it.

On February 15 there was issued a report by the Departmental Committee on questions arising out of the Workmen's Compensation Acts, making recommendations on the certification of miners' nystagmus, on the appointment and powers of medical referees, and on kindred matters. Appointment of medical appeal tribunals is recommended.

Progress of Slum Clearance

In the House of Commons on February 15 Sir KINGSLEY WOOD moved the second reading of the Housing (Financial Provisions) Bill, which, he said, provided for the furtherance of the work of slum clearance and of dealing with overcrowding. Special provision was also made for agricultural housing, and the exceptional conditions prevailing in small urban areas would also be met. The slum clearance programme covered about 400,000 houses. Some 800,000 persons had passed from slums to new and good housing conditions, and others would be dealt with at the rate, on an average, of 25,000 a month. It was estimated that for the execution of the present programme of slum clearance and for dealing with overcrowding on the present standard some 600,000 new houses were required—400,000 for slum clearance and 200,000 for the abatement of overcrowding. About 200,000 houses had been built to date towards that total, and another 70,000 houses were under construction, while houses were being completed at the rate of about 7,000 a month.

Under the Bill, houses completed not later than December 31, 1938, would rank for subsidies fixed by the Acts of 1930 and 1935. Those finished after that date would rank for subsidies fixed by the present Bill. It was provided that a further review of the position should be made after December 31, 1941. Two important changes were contained in the new financial provisions. The first was the fixing of the two subsidies for slum clearance and overcrowding at the same level, and the second was that there would be an annual contribution for each house built over a period of forty years. The uniform subsidy, so far as slum clearance was concerned, would allow local authorities to let houses at practically the same rents as were contemplated when the slum clearance subsidy was fixed in 1930. With regard to rural housing, the Government proposed to introduce legislation at an early date to extend for four years the Housing (Rural Workers) Act, which would expire in June.

A motion for the rejection of the Bill, moved by Mr. Greenwood, was defeated, and the Bill read the second time.

Mr. ELLIOT, replying to Mr. Henderson Stewart and Mr. Westwood on February 15, said he intended to submit to Parliament a draft order designed to continue the existing rates of subsidy under the Housing (Scotland) Acts of 1930 and 1935.

Medical Aid in China

On February 14 Mr. EDEN informed Mr. Mathers that an English-speaking group appointed under the League of Nations' plan of anti-epidemic assistance to China had been constituted under the leadership of Dr. R. C. Robertson and was already in China.

Pasteurized Milk: Reports of Milk Nutrition Committee

Mr. W. S. MORRISON, replying to Captain A. Evans on February 14, said that the Milk Nutrition Committee had published a report dealing with experiments on rats at the National Institute for Research in Dairying, Reading, and at the Rowett Institute, Aberdeen. Two further reports, dealing respectively with the work at these two institutions on the feeding of calves on raw and pasteurized milk, and with an investigation into the effect of dietary supplements of raw and pasteurized milk on the growth and health of school children, were in preparation and would be published shortly. The committee proposed to issue thereafter a final report dealing with their inquiries as a whole.

Derating of Hospitals.—Sir COOPER RAWSON asked, on February 10, whether the Government would introduce legislation to effect the derating of hospitals in view of the heavy burdens consequent on rebuilding and reassessment. Sir KINGSLEY WOOD regretted it was not possible to do this. Proposals of this kind had been considered on many occasions and strong objections to their adoption had been found.

Silicosis Scheme: Claim by Sheffield Widow.—Mr. A. V. ALEXANDER asked on February 10 that the Home Secretary should further consider the claim of a Sheffield widow, under the Silicosis Scheme, in respect of the death of her husband. He said her claim had been rejected in spite of the fact that this man had previously been awarded compensation for silicosis at the full rate for a period of five years upon a certificate of total disablement due to this disease, and that, after a post-mortem examination, the coroner certified that death was primarily due to silicosis. Sir SAMUEL HOARE said there were two examinations in this case, and that the final authority, the Silicosis Medical Board, came to the decision, after a post-mortem examination, that death was caused by independent conditions and not by silicosis. The Board had unique experience in diagnosis of silicosis, and its decision was authoritative. The Board had always been regarded as a final authority and he did not see what other authority one could have. Mr. ALEXANDER said there should be a right of appeal from the decision of the Board, and Mr. JAMES GRIFFITH remarked that the Medical Board was compelled to find silicosis as the primary cause of death, although in many cases it was a subsidiary one. Sir SAMUEL HOARE promised to look into the points raised, though he had no reason to believe that the Board was not an effective tribunal.

Medical History of ex-Service Men.—On February 14 Mr. ORR-EWING asked the Minister of Pensions whether in future the full medical history of an ex-Service man while in any of the Services could be supplied to his medical adviser if such a man made a written request to this effect. Mr. H. RAMSBOTHAM replied that the Service records were confidential. He could not, therefore, adopt the suggestion. It was, however, the practice of the Ministry to welcome any reasoned statement in support of the claim from the man's own medical adviser, and to give him an opportunity to discuss the case with a medical officer of the Ministry in his area.

Notes in Brief

The report of the Committee on Miners' Nystagmus has been presented to Parliament. Sir Samuel Hoare stated on February 3 that it would be issued shortly.

No special investigation has been made or is contemplated by the Ministry of Health into the nutritive value of margarine that has or has not been vitaminized. The Advisory Committee on Nutrition has recommended that where margarine is used it should be vitaminized. This recommendation has been conveyed to local authorities.

Medico-Legal

EFFECT OF A DELUSION ON A WILL

Not every testator of doubtful sanity is incapable of making a valid will. The classical instance of this principle is *Cartwright v. Cartwright* (1793), in which a chronic mental patient made a sensible will which was held to be valid, although her conduct immediately before and after was disordered and violent. The question before the court is not whether the testator was mad but whether his will was affected by his mental disorder. A frequent, because obvious, form of mental disorder rendering a will invalid is a definite delusion. Until the case of *Bohrmann* (1938) the court had never pronounced one clause in a will invalid for this reason and granted probate of the rest. In that case, however, Mr. Justice Langton found that a clause in one codicil was vitiated by an insane delusion but the rest of the will was not.

An elderly bachelor left an estate worth £180,000. He had made a will in 1926 in which he left small legacies to some of his relatives and the bulk to charities in England. He afterwards executed four codicils, in the last of which, made in 1932, he directed that the clause of the will by which he gave his money to charities should be "read and construed as if the word England were deleted therefrom and the words United States of America were substituted for the word England."

The relatives contested the will and codicils, alleging that the testator when he made them was suffering from insane delusions and obsessions, and was so devoid of ordinary human instincts as not to recognize the claims of family sentiment. The evidence showed that, as the learned judge put it, he was a man of very few friendships; he gave very little in life and got very little out of it. He was not a kindly or an affectionate man, and on smallest provocation he gave way to fits of ungovernable rage. He was a chronic asthmatic and a hypochondriac. In short, he was a most eccentric, very unreasonable, very spoilt, and rather useless human being. From medical evidence it appeared that in 1933 he ought to have been under some form of supervision. Dr. R. D. Gillespie, whom the judge complimented very highly both on his knowledge of psychiatry and on his ability and impartiality as a witness, noted that many of the testator's collateral relatives had been schizophrenes and suffered from paranoia. The testator was a paranoid psychopath, a person who was likely to entertain a definite delusion on one point and to have a clear intelligence on others, and who was deficient in human affections and the common instincts of mankind. The judge had to apply to this evidence the test formulated by Sir Alexander Cockburn, Chief Justice, in *Banks v. Goodfellow*.

"If the human instincts and affections, or the moral sense, become perverted by mental disease; if insane suspicion or aversion take the place of natural affection; if reason and judgment are lost and the mind becomes a prey to insane delusions calculated to interfere with and disturb its functions, and to lead to a testamentary disposition due only to their baneful influence—in such a case it is obvious that the condition of the testamentary power fails, and that a will made under such circumstances ought not to stand."

The law, said Mr. Justice Langton, has not recognized any half-way house between sanity and delusional insanity. One is treading upon dangerous ground if one goes a step further and says that a person who lacks to a certain degree the human instincts is therefore incapable of making a will. Such a step, he considered, could only be taken by legislation. He therefore could not find that this testator was incapable of making a good will. He was particularly impressed by one action of the testator in making a present of £400 to a needy relative and suggesting that if the relative desired to pay interest he should pay it into the bank for the benefit of his children. The testator had also carried out instructions, which had no legal force, in the wills of his brother and his mother

to leave two sums of a thousand pounds each to two cousins. The judge therefore could not believe that the testator was incapable of the human instincts of affection and consideration for relatives, and held that although the testator was a paranoid psychopath he had none the less made a valid will and three valid codicils.

A Delusion of Persecution

The fourth codicil, however, was a different matter altogether. The London County Council, desiring to enlarge a hospital, gave the testator notice that they would expropriate his home on Denmark Hill. Although they treated him with great consideration and twice extended the time within which he should have left the premises, he convinced himself that they were persecuting him because one of their valuers had a private grudge against him. He characterized them on many occasions in ridiculous terms, and even wrote a doggerel poem cursing them. The judge was quite satisfied that the testator had harboured an insane delusion against the Council. From the beginning of 1932 he had thrown his whole energies into a battle with them which was the overmastering motive of his life till he died. His fourth codicil, in which he deflected his bounty from English to American charities, was an expression of his hatred for the Council. His lordship therefore considered it right and proper to treat this particular clause as affected by the testator's delusion and to delete it, while allowing probate of the will, the first three codicils, and the rest of the fourth codicil. He admitted that he knew of no previous case in which a judge, on the ground of delusion, had disturbed a part of a will and left the rest. He could not, however, see that his decision conflicted with established law: the court frequently deleted from wills matter which they were satisfied had never been brought to the knowledge and approval of the testator. The learned judge felt that he was only applying the same principles when he deleted matter which he believed to have been tainted by delusion.

LIABILITY OF A JEWELLER

The standard of care required of a person who does any kind of surgical operation depends upon the profession which he makes to the public. If he says he is a specialist the standard is very high. If he does not claim to be qualified at all it is fairly low. Mr. Justice Goddard had recently¹ to determine what standard of care and skill is required of a jeweller who pierces a client's ears for earrings. A lady asked the jewellery department of a large store to arrange to have her ears pierced. They employed a man who was used to the operation; he sponged the ears with an antiseptic, dipped his fingers into it, and pierced her ears with an instrument which he had brought with him and which he first held in a flame. She had chosen the particular day on which this was done because she was to go into a nursing home on the following day for a severe operation, and considered that her convalescence would give her a good opportunity of healing her ears before the earrings were fitted. For this purpose she had to wear "sleeper" rings, which are rather unsightly. She had her operation, and about ten days after the piercing she developed an abscess of the lymph glands in the neighbourhood of the left ear, for which she had to undergo an incision. She sued the firm, alleging that the employee had been negligent and had not taken reasonable precautions against infection. The learned judge said in his judgment that the jeweller could not be expected to use the degree of care which a doctor should use. The firm would be liable if he had used a wholly unsuitable or dirty instrument. The degree of cleanliness must be one reasonable for a jeweller—not for a surgeon. He saw no grounds for holding that the jeweller had departed from the standard of care appropriate to his profession, nor could he find that the abscess was due to any action of the jeweller's. He thought it much more likely that the infection took place after the piercing. He therefore dismissed the action, but said

¹ *Times*, January 29: *Phillips v. Wm. Whiteley, Ltd.*

EPIDEMIOLOGICAL NOTES

Enteric Fever

During the week there have been 4 more cases of typhoid fever in the Somerset outbreak, bringing the total to 39, while an additional death has brought the total deaths to 5. The outbreak has remained confined to the original districts of Highbridge and Huntspill. Although the source of the infection has not been traced, the initial outbreak appears to have come to an end, and the last few cases probably resulted from contact with the primary cases. Of the two cases of typhoid fever notified in London during the week under review, 1 each occurred in the borough of Kensington and the city of Westminster.

Diphtheria and Scarlet Fever

As pointed out last week the incidences of diphtheria and scarlet fever are appreciably higher this year compared with the corresponding week last year in all five countries. In most of the countries the diseases appeared to be on the increase, but this week there is a drop in the notifications of both diseases for all five countries with the single exception of scarlet fever in Northern Ireland, where 88 cases were notified compared with 84 in the previous week.

Influenza

Notifications of influenzal pneumonia continue to fall in England and Wales—1,128 compared with 1,302 in the previous week—while for London the figures are 78 and 110 respectively. The increase of 6 deaths in England and Wales is probably attributable to the lag of 7 to 14 days between notification and death.

Measles and Whooping-cough

During the week under review there were 37 notifications of measles in the London boroughs in which the disease is notifiable, compared with 23 in the previous week. During the same period 1,152 cases were reported from the L.C.C. elementary schools compared with 784 last week and 522 in the previous week, and the average daily measles admissions to the L.C.C. fever hospitals was 39 compared with 32 and 25 in the two previous weeks. On the other hand, the measles epidemic in Scotland appears on the whole to be abating; there have been only 1,330 notifications compared with 1,661 in the previous week, while the deaths remain at 17. The fall in notifications was seen in Edinburgh and Dundee, while in Glasgow the figures have risen from 1,013 to 1,020. The Belfast outbreak has probably reached its peak, the figures for the last three weeks being 832, 728, and 789 respectively. Mortality from whooping-cough appears to be increasing in England and Wales, deaths for the week being 27 for the whole country and 5 for London, compared with 20 and 2 for London in the previous week.

Acute Poliomyelitis

During the last few months there has been an epidemic of acute poliomyelitis in Victoria, Australia, with 1,695 cases and 88 deaths. The peak of the epidemic has probably been reached. While immune serum continues to be used both in treatment and prophylaxis, there have been no reports so far of the application of chemical substances such as zinc sulphate to the nasal mucous membrane in the hope of averting attack. Sister Kenny's system of treatment of paralysis is being given a thorough trial in the State of Victoria.

Medical News

The 163rd anniversary dinner of the Medical Society of London will be held at Claridge's on Tuesday, March 1, at 7.45 p.m.

The eighth Sir Robert Jones Lecture will be given by Dr. Frederick C. Kidner, President of the American Orthopaedic Association, on the subject of congenital dislocation of the hip, on February 24, at the Hospital for Joint Diseases, Madison Avenue, New York City.

A meeting of the Lancashire and Cheshire Branch of the British Medical Association will be held at Salford Royal Hospital on Wednesday, February 23, at 4 p.m., when Mr. R. Ollerenshaw and Mr. W. Sayle Creer will speak on "Common Foot Deformities and the Function of the Chiroprapist attached to a General Hospital." Further particulars appear in our Supplement.

The annual general meeting of members of the Medical Peace Campaign will be held to-day (Saturday, February 19) at Friends House, Euston Road, N.W., at 5 p.m. Dr. Adrian Stephen will take the chair.

A meeting of the Medico-Legal Society will be held at 26, Portland Place, W., on Thursday, February 24, at 8.30 p.m., when a paper will be presented by Dr. Gerald Slot and Mr. B. A. Levinson on "The Status, Scope, and Legal Position of the Unqualified Practitioner."

The Hunterian Oration before the Hunterian Society will be delivered at the Mansion House, E.C., on Monday, February 28, at 9 p.m., by Sir Frederick Hobday, on "John Hunter—Pioneer of Veterinary Science."

A meeting of the West London Medico-Chirurgical Society will be held at West London Hospital, Hammersmith, W., on Friday, March 4, at 8.30 p.m., when Dr. Donald Hunter will speak on "Industrial Diseases."

A medical congress will be held at Tunis on April 11 to 13 under the presidency of Dr. Etienne Burnet, director of the Pasteur Institute of Tunis. The chief subject for discussion will be the aetiology, epidemiology, clinical aspects, prophylaxis, and treatment of trachoma. Further information can be obtained from the general secretary, Maison du Médecin, 25, Avenue de Paris, Tunis.

The Grenfell Association of Great Britain and Ireland has arranged a lantern lecture on medical work in Labrador and North Newfoundland, to be given by Dr. Charles Hogarth Forsyth of Labrador, in the Assembly Hall of the Royal Empire Society, Northumberland Avenue, W.C. (entrance in Craven Street), on Tuesday, February 22, at 5 p.m.

Two £100 scholarships are again being offered at Port Regis Preparatory School to sons of medical men. The examination is being held in March, 1938, and candidates must be under 9 years of age at the time of competing. Applications for the scholarships should be addressed to the Headmaster, Port Regis, Broadstairs, not later than February 20. The school is situated in the healthiest and most bracing position in Broadstairs and Kingsgate-on-Sea, and has an excellent record.

The issue of the *Bulletin de l'Office international d'Hygiène publique* for December, 1937, is devoted to plague, scarlet fever, tularaemia, infectious diseases, and mental disorders.

The issue of *Paris Médical* for January 15, which is devoted to dermatology, contains an interesting but by no means flattering description of the new buildings of the *Infirmerie Saint-Lazare* used for the treatment of prostitutes suffering from venereal diseases.

Geh. Rat August Bier, emeritus professor of surgery at Berlin University, celebrated the fiftieth anniversary of his qualification on January 30.

Sir Comyns Berkeley has been nominated an honorary member of the German Society for Gynaecology.

INFECTIOUS DISEASES AND VITAL STATISTICS

We print below a summary of Infectious Diseases and Vital Statistics in the British Isles during the week ended February 5, 1938.

Figures of Principal Notifiable Diseases for the week and those for the corresponding week last year, for: (a) England and Wales (London included). (b) London (administrative county). (c) Scotland. (d) Eire. (e) Northern Ireland. Median values for the last 9 years for (a) and (b).

Figures of Births and Deaths, and of Deaths recorded under each infectious disease, are for: (a) The 125 great towns (i) in England and Wales (including London). (b) London (administrative county). (c) The 16 principal towns in Scotland. (d) The 13 principal towns (ii) in Eire. (e) The 10 principal towns (iii) in Northern Ireland.

A dash — denotes no cases; a blank space denotes disease not notifiable or no return available.

Disease	1938					1937 (Corresponding Week)					1928-36 (Median Value Corresponding Weeks)

* 789 cases in Belfast alone.
† After October 1, 1937, puerperal fever was made notifiable only in the Administrative County of London.

‡ Deaths from puerperal sepsis.
§ Includes primary form in figures for England and Wales, London (administrative county), and Northern Ireland.

EPITOME OF CURRENT MEDICAL LITERATURE

Medicine

140 Diagnosis of von Recklinghausen's Disease

F. NØRGAARD (*Hospitalsidende*, November 16, 1937, p. 1209) gives an account of two cases of neurofibromatosis in which various abnormalities of the skeletal system were demonstrable, and suggests that when the other manifestations of von Recklinghausen's disease are ill developed these changes may be of value in differential diagnosis. His first patient was a woman aged 21, and the skeletal abnormalities were confined to one side of the body. This fact, and the existence of these changes in infancy, made it probable that they were congenital. After giving details of the second case, that of a cigar-sorter, aged 49, who since childhood had been hunch-backed, the author reviews the bony changes which have already been recorded in the literature. They consist of deformities of the spine, including scoliosis and kypho-scoliosis, changes resembling those of osteomalacia, periosteal cysts, and an increase or decrease in the growth in length of certain of the long bones or of the whole of one limb. The skiagrams taken of the author's two patients revealed most of these skeletal changes, which, in his opinion, must be traced back to defects in the germ cells rather than to later circulatory disturbances or to the influence of the neurofibromata on growth.

141 Chronic Mastopathy

R. WANKE and H. PAULSEN (*Klin. Wschr.*, December 4, 1937, p. 1727) support the view that chronic mastopathy is due to an endocrine dysfunction affecting particularly the production of follicular hormone. In experimental animals mammary conditions resembling those of fibrocystic disease have been found where there is follicular inhibition. The exhibition of folliculin causes regression of the same condition in the human subject. Wanke and Paulsen have measured the amounts of anterior pituitary hormone and follicular hormone excreted in the urine in two patients, aged respectively 32 and 27, with chronic cystic mastopathy. In the first the excretion of anterior pituitary hormone was normal; but the follicular hormone excretion was reduced to 472 units, compared with a normal total of 1,000 to 3,000 mouse units, and showed an inversion of the normal curve—that is, the excretion was least in the interval between the menstrual periods, whereas normally it is greatest at that time. In the second patient the results of the pituitary hormone estimations are not given, but the month's follicular hormone excretion was only 230 units, and from the fifteenth to twenty-third days the average excretion was 8 to 9 units as compared with a normal of 120 to 180 units. Wanke and Paulsen point out that chronic mastopathy with its diminution of folliculin metabolism may be regarded as the antithesis of glandulo-cystic endometrial hyperplasia, in which overproduction of follicular hormone is proved; a coexistence of the two morbid conditions, they state, has so far never been reported.

142 Malaria in Italian East Africa

G. LEGA, G. RAFFAELE, and A. CANALIS (*Riv. Malariol.*, 1937, 16, -5, 325) have surveyed malarial conditions in Abyssinia, Amhara, Eritrea, and Italian Somaliland during 1936. Owing to the paucity of communications epidemic regions were rare, but diffuse endemic infection was noted over extensive areas, especially 900 to 1,400 metres above sea level. In the plateaux and mountains more than 2,000 metres above the sea malaria was not encountered. At about 1,000 metres splenic indices of 70 to 90 per cent. were not uncommon; *Plasmodium falciparum* and *P. vivax* were found, chiefly the former. *P. vivax* prevails at great altitudes and in the eastern

plains. *P. malariae* is comparatively uncommon. Quartan infection was rarely seen, but the benign tertian cases seemed more severe than in Italy, and a new variety of *P. falciparum* was found in certain malignant tertian cases; the ringed trophozoites averaged 3.7 μ in diameter as compared with 2.66 μ for the typical *P. falciparum*, and the male gametocytes become flagellated in as little as three to five minutes. Thirteen species of anophelids were found, in the higher regions chiefly *A. cinereus* and *A. demeilloni*.

Surgery

143 Osteosynthesis for Fracture of the Femoral Neck

K. LEHMANN (*Hospitalsidende*, November 30, 1937, p. 1) has performed Johansson's osteosynthesis on thirty-four patients suffering from fracture of the neck of the femur. Of the twelve patients in one hospital two died as a result of the operation and one some time after it of cancer. After an observation period of two to three years it could be claimed for six of the surviving nine patients that the results were perfect, and for two that they were comparatively good. Only in one case was the result bad. In another hospital the observation period for the twenty-two patients was too short to warrant claiming final results. Four of the operations had already to be regarded as failures, and one of the patients had died at operation. In fifteen cases the results promised to be good. The author is on the whole greatly impressed by recent achievements in this field, and he draws attention to the way in which Johansson's operation is approved by all with an extensive experience of it. Three failures in the second series were due to late dislocation or the formation of a pseudarthrosis. These failures have taught the author to keep his patients in bed for as long as six weeks, and not to let any weight be borne by the pegged femur till at least two months after the operation. Only in one case did necrosis of the head of the femur threaten. This complication, which is fairly common to judge by the literature, is, in the author's opinion, the most important cause of the failures for which the surgeon is not responsible. It is generally agreed that the foreign body introduced into the bone is not responsible for this complication, which occurs even when no operation is attempted. The author advises against massage for after-treatment as it is difficult to control and may be carried out with injurious forced movements. The operation should be performed early; an interval of two to three months between fracture and pegging is enough to affect the results. The author is reserved in his advocacy of pegging for lateral fractures of the neck of the femur.

144 Lobectomy for Bronchiectasis

J. HOLST (*Finska Läk.Sällsk. Handl.*, October, 1937, p. 794) believes that the combination of dilated bronchi and infection creates a vicious circle which cannot be broken solely by combating the infection with drugs, vaccines, or bacteriophage. But it can be broken by mechanical means directed against the factors responsible for the retention of secretions in the bronchi. His indications for lobectomy are liberal, as, in his opinion, the wait-and-see alternative leads sooner or later in most cases to pneumonia, pulmonary abscesses, empyema, metastatic abscesses, or amyloid disease after years of suffering. His material consists of nineteen cases of "primary" bronchiectasis, in as many as ten of which the disease was limited to the left lower lobe. In five cases it was limited to the right lower lobe, and in one to the middle lobe. In the remaining three cases several lobes were involved. In as many as ten cases the disease had begun before the age of 15, and only in seven cases was the onset after the age

Letters, Notes, and Answers

All communications in regard to editorial business should be addressed to THE EDITOR, BRITISH MEDICAL JOURNAL, B.M.A. HOUSE, TAVISTOCK SQUARE, W.C.1.

ORIGINAL ARTICLES and LETTERS forwarded for publication are understood to be offered to the *British Medical Journal* alone, unless the contrary be stated. Correspondents who wish notice to be taken of their communications should authenticate them with their names, not necessarily for publication.

Authors desiring REPRINTS of their articles published in the *British Medical Journal* must communicate with the Secretary, B.M.A. House, Tavistock Square, W.C.1, on receipt of proofs. Authors over-seas should indicate on MSS. if reprints are required, as proofs are not sent abroad.

All communications with reference to ADVERTISEMENTS should be addressed to the Advertisement Manager. Orders for copies of the *Journal* and communications with reference to subscriptions should be addressed to the Secretary, B.M.A. House, Tavistock Square, W.C.1.

The TELEPHONE NUMBER of the British Medical Association and the *British Medical Journal* is EUSTON 2111.

The TELEGRAPHIC ADDRESSES are
EDITOR OF THE BRITISH MEDICAL JOURNAL, Aitiology
Westcent, London.

SECRETARY, Medisecra Westcent, London.

Garden, Edinburgh; tele-
phone : : : : : and of the Office of the Irish Free
State : : : : : A. and B.M.A.), 18, Kildare Street,
Dublin (telegrams: *Bacillus, Dublin*; telephone 62550. Dublin).

QUERIES AND ANSWERS

Primary Vaccination at the Age of 12

"CHELSEA" writes: Can any reader advise me in regard to the following problem? My son, aged 12, was not vaccinated as an infant, and he is now being entered as a scholarship candidate at one or two public schools. The memorandum published by the Ministry of Health deprecates primary vaccination after the age of 1 year owing to the risk of encephalitis, and I fear that most schools will be closed to him unless he is vaccinated. Have any readers faced this problem with their patients' children? If so, I should like to know how they dealt with the situation.

Enlarged Foliate Papillae

"D. Y. C." writes: I have had difficulty in treating a case of enlarged foliate papillae in a woman, aged 26, who for the last two years has had attacks of granular pharyngitis, which usually occurs in December or January. There is periodic enlargement of the papillae on one or other side, sometimes on both, accompanied by severe tenderness and dryness; sucking lozenges, for example, aggravates the condition. I have tried painting with Mandl's paint, with argyrol, and with glycerin. I have prescribed various gargles, and have administered tonics containing iron and vitamin preparations. I have also had her teeth seen to, but there are no dentures to cause this condition. I should be grateful for any advice on the subject.

Fomites et Alia

Professor MILES H. PHILLIPS writes: Of course "Senex" is correct in his condemnation of my misuse of the word "fomites." Actually I had realized the danger and had intended, but forgotten, to throw the responsibility on to Dr. Henry by placing the word in quotation marks. It would be clearer and fairer to use Henry's phrase "contagion of fomites." I am glad of this opportunity to correct two other mistakes. In my desire to confine my lecture within a time limit I discarded a sentence stating that "my own attention was first forcibly directed to this danger of spray infection by the Scottish Board of Health Report on Maternal Mortality in Aberdeen by Parlange Kinloch, J. Smith, and J. A. Stephen (Edinburgh, 1928), and, later, by the further investigations and papers of J. Smith" (*J. Obstet. Gynaec. Brit. Emp.*, 1933, 40, 991). Colebrook in his book drew special attention to the work of J. Smith of Aberdeen. I now realize that I thus came to omit the name of one of the most convincing of the pioneers in this special quest. However, I cannot explain the blunder I made in referring to Professor DeLee as Benjamin instead of Joseph B., but I can ask for his forgiveness.

Herpes and Varicella

Dr. E. R. HARGREAVES (East Keswick, near Leeds) writes: The close association of varicella and herpes zoster is well known, but it is impossible to exclude other sources of infection. In this respect the following case is perhaps worthy of record. On December 3, 1937, I was called to see a governess employed at an old manor house in the depths of the country; she was suffering from a very mild attack of right-sided cervical herpes zoster. Eleven days later I visited the youngest son of the house, a boy of 15, who had contracted chicken-pox. This boy, who had been "backward" since birth, had his own rooms at the back of the house, his education being in the hands of the governess. Apart from daily walks in the surrounding park, the boy had not been out of his rooms during the month preceding his illness. So far as I am aware there has been no case of chicken-pox in the district for over a year.

Sterilization of Catheters

Dr. C. L. L. MURRAY (Box 322, Murraysburg, South Africa) writes: Some time ago I came across a prescription for a special non-corrosive solution for keeping rubber and metal catheters constantly sterile. Would anyone who knows this prescription kindly communicate with me?

LETTERS, NOTES, ETC.

Strength of Intravenous Saline Infusion

Dr. W. KERR RUSSELL (London) writes: As the number of doctors who are becoming interested in artificial fever treatment is greatly increasing I think it may be helpful to draw the attention of readers to a small error which appeared in the reprint of a very interesting article on fever therapy by Drs. P. S. Hench, C. H. Slocumb, and W. C. Popp of the Mayo Clinic in the *Journal of the American Medical Association*, pp. 1779-90. On page 25 of the reprint there is a typographical error. In mentioning that in about 3 per cent. of cases having hyperpyrexia treatment there are protracted anorexia, nausea, and frequent vomiting for a period lasting from twenty-four to forty-eight hours, they say that "the condition can be promptly overcome by the intravenous administration of from 500 to 1,000 c.cm. of 10 per cent. dextrose and 10 per cent. saline solution." This latter amount is incorrectly reprinted, and should read 1 per cent. saline solution. Though this article was published as long ago as May 18, 1935, it is still very frequently referred to and quoted.

Slough Social Centre

Dr. F. M. DAY (assistant county medical officer of health and medical officer attending the Slough Social Infant Welfare Centre) writes: In your issue of January 29 (p. 246), in an article dealing with Slough Social Centre, a statement is made that 150 children are seen weekly at the infant welfare centre by the visiting doctor. I should like to point out that this number attend the Centre weekly and that any of them may see the doctor, but that the number actually brought to him does not exceed fifty children a week.

The Bart's Journal

We welcome the enterprise shown by St. Bartholomew's Hospital Journal in persuading Mr. Eric Gill to engrave a design for the cover. The picture of Rahere healing the sick has a truly mediaeval effect, and recalls the antiquity of the hospital. Many Bart's men will be surprised to learn that Marcus was the Christian name of their founder, and will ask why Sir Norman Moore and Sir D'Arcy Power did not know it. The design on the cover is apparently but an introduction to further changes in format, and it is announced in the February issue that the letterpress will next month be printed in Baskerville type.

South African Sound Films

A programme of South African sound films is being privately displayed in the Cinema Hall at South Africa House. Among other items the programme includes films of the Zimbabwe Ruins, the Mountain Waters of Natal, and the aerial journey from Johannesburg to Cape Town. Application for admittance, which is free, should be made to the High Commissioner for the Union of South Africa, South Africa House, Trafalgar Square, London, W.C.2.

Ophthalmology

150 Vitamin A in Ocular Disturbances

A. M. YUDKIN, A. U. ORTEN, and A. H. SMITH (*Amer. J. Ophthalm.*, November, 1937, p. 1115), experimenting on adult albino rats, noted lachrymation, photophobia, and enophthalmos followed by viscosity of the tears, congestion of the eyeball, keratitis, and corneal herpes. There is a substitution of stratified keratinizing epithelium for normal epithelium with a cellular exudative reaction beneath. Later, vascularization occurs with ulcer formation. Giving vitamin A leads to recovery, and hyperkeratosis of the epithelium. Subclinical vitamin A deficiency as shown by variations in dark adaptation is fairly common. Certain cases of keratitis with ulceration, at first resembling a catarrhal, later a rodent, type, of which the treatment is often unsatisfactory, are benefited by an increased vitamin intake.

151 Infantile Glaucoma

B. J. TISCORNIA (*Rev. méd. Lat.-Amer.*, September, 1937, p. 1329) discusses the subject of glaucoma in children and examines the various theories put forward in explanation of this disease. He inclines to the opinion that infantile glaucoma, buphthalmos, or hydrophthalmos is in most cases due to congenital causes, particularly syphilis, congenital malformations, foetal rickets, and possibly to consanguinity in the parents, all of which favour the onset of the inflammatory vascular lesions which are to be seen in this condition. He administers specific treatment not so much in the hope of influencing the course of the disease (for he has never observed any improvement even in cases which were obviously due to syphilis), but mainly with a view to increasing the general resistance before operation. The author also regards symptomatic treatment as being extremely valuable both for the alleviation of symptoms and as a method of pre-operative preparation. Although he has obtained good results with other methods, Tiscornia prefers Elliot's operation to all others.

152 Cataract and Vitamin C

L. SILVA and J. L. NOVAES (*Brazil-med.*, December 11, 1937, p. 1223) discuss the aetiology of cataract and its treatment with vitamin C. The lens, being completely avascular and suspended and immersed in the aqueous humour, must derive its nourishment from the constituents of this "secreto-dialysata," which is in turn derived from the blood. Apart from traumatic cataract (including that due to x rays, ultra-violet rays, or radium) the more usual forms of cataract are accompanied by changes in the composition of these two media. The only way in which the lens can react to these changes is by losing some of its transparency—that is, by the formation of opacities of one kind or another. The chemical changes in the blood which occur in the metabolic disturbances which accompany such conditions as diabetes, nephritis, etc., cannot entirely account for the changes in the lens. The occurrence of post-asphyxial cataract is a proof that lens opacities can be produced by oxygen deficiency, and, provided the changes are not too advanced, their reversal may be accelerated by the administration of oxidizing substances. It has been shown that the lens absorbs oxygen and gives out hydrogen, so that its metabolism may be likened to a form of respiration. Vitamin C exists in three forms: reduced, oxidized but reversible, oxidized and fixed. In the aqueous humour it occurs normally in the reduced form. Hence, vitamin C forms part of a natural oxidation-reduction system. Silva and Novaes have now treated with vitamin C over twenty cases, some of which they describe in detail; many were greatly

benefited, but in others the process had gone too far for any hope of improvement. The authors are convinced that medical treatment should be tried in all early cases, and they consider that up to the present vitamin C is the substance which best assists the "respiration" of the lens. They give intravenous injections because it has been shown that vitamin C may under certain conditions be destroyed in the alimentary canal.

153 Filarial Keratitis

MARRAIX and APPLEMAN (*Arch. Ophthalm.*, Paris, November, 1937, p. 978) state that changes in the conjunctiva and cornea, cutaneous symptoms, and eosinophilia in a person who has lived in a tropical country suggest filariasis. The *Onchocerca volvulus* is a connective-tissue parasite with special affinity for the conjunctiva. The adult worm forms a subcutaneous nodule on the costal cartilage at articulations or on the cranium. The embryos are mobile in the skin and eyes. A biopsy on a piece of conjunctiva showed an infiltration of eosinophils in the glandular layer. The vessels were engorged but there was no diapedesis. A localized degenerating inflammatory nodule resembled that of leprosy, spirochaetosis, ophthalmia nodosa, or a foreign-body granuloma, but the eosinophilia pointed to parasitic disease. Microfilariae were discovered immediately below the epithelium. The parasites act not only as a foreign body but also as a chemical irritant when they decompose, causing tissue changes similar to those in cysticercosis and trichinosis. The tissue reactions noted are probably in response to dead filariae. The case of onchocerciasis described showed an almost haemorrhagic injection of the conjunctiva with no discharge. The cornea had several raised, superficial, non-ulcerated, avascular, opaque areas at its margin. The epithelium and Descemet's membrane were normal, and the vision was unaffected. The prognosis is grave, blindness often supervening from keratitis and uveitis, the microfilariae invading the interior of the eye. Treatment should be directed at extirpation of the adult nodules. Medicaments are of little use, though emetine chlorhydrate has been used with benefit.

154 Retinitis of Pregnancy

J. N. DUGGAN and V. K. CHITNIS (*Brit. J. Ophthalm.*, November, 1937, p. 585) note three interesting cases. The first had oedema of the legs and sudden failure of vision. There was a marked bilateral neuro-retinitis with much soft exudation and oedema in the macula region and detachment below. The second patient, aged 35, had "silver wire" arteries, a macular star, early secondary optic atrophy, and absorbing haemorrhages, following neuro-retinitis. This case probably began as a chronic nephritis complicated by pregnancy. The third case had unilateral retinal oedema and soft exudates. Vision improved on the termination of pregnancy. Blurring of vision had occurred with the previous pregnancy. The other eye showed past retinitis. In all three cases the eyes were unaffected in the first two pregnancies, and termination of pregnancy led to great ocular improvement. The sudden onset, the marked oedema, and the quick recovery mark this type from the retinitis of other forms of Bright's disease. Retinal lesions are commonest in pregnancy with chronic nephritis, pre-eclamptic toxæmia, eclampsia, and the low-reserve kidney, and frequently assist in differential diagnosis and in indicating when labour should be terminated.

155 Disciform Degeneration of Macula

F. H. VERHOEFF and H. P. GROSSMAN (*Arch. Ophthalm.*, Chicago, October, 1937, p. 561) analyse all recorded cases as occurring in white races at from 39 to 83 years of age. In about half the degeneration was unilateral. Central vision was greatly impaired or abolished at the first exam-

of 20. In nine cases the disease had simulated pulmonary tuberculosis for many years, several of which had been spent in institutions for the tuberculous although tubercle bacilli had never been found. The author tabulates the results of various operative interventions, including lobectomy in nine cases. Of these nine patients, seven could be considered as cured and one as improved; the ninth patient, operated on bilaterally, developed a fatal empyema. The author concludes that the literature and his own experience justify the opinion that there is no other way of effecting a radical cure of a localized bronchiectasis than by total extirpation of the diseased lobe or lobes of the lungs, and he does not think that even bilateral disease, poor general health, or an age over 50 should be regarded as absolute contraindications, provided the patient has at least two normal lobes, both on one side or one on each side.

Therapeutics

145 Non-specific Treatment of Gonorrhoea

J. FORSSMAN (*Nord. med. Tidskr.*, December 4, 1937, p. 1984) considers dead or living micro-organisms easily the most effective of the non-specific agents, and he suggests that at present non-specific treatment by parenteral injection is practised on a much greater scale than is generally realized, for all the presumably specific vaccines and sera contain proteins whose action on the body is, also non-specific. Forssman suspects that the effectiveness of specific gonococcal vaccines depends mainly on their non-specific properties, for the benefits of an injection begin too early to be attributed to any specific process, which would require at least four to five days in which to develop. The fact that intramuscular injections of milk act on gonorrhoea in the same way as specific vaccines also suggests that the effects of the latter are non-specific. For about twenty years Forssman has treated the complications of gonorrhoea with a *B. coli* vaccine given by intravenous injection, and he has been much impressed by the prompt response thereto of the most exquisitely tender gonococcal arthritis. As a rule, such joint affections subside completely after four to six intravenous injections.

146 Treatment of Female Gonorrhoea

ST. WOLFRAM (*Wien. klin. Wschr.*, December 31, 1937, p. 1776) points out that the accurate diagnosis of gonorrhoea in the female by examination of the vaginal secretion, cultural methods, and the complement fixation test is of primary importance in the prevention of the serious complications of this condition. The treatment of superficial gonorrhoea (usually with a negative complement fixation reaction) is effected by bactericidal, that of deep-seated gonorrhoea with immuno-biological, agents. Active therapy is contraindicated in the acute stages, when rest in bed and sitz-baths should be ordered. In subacute and chronic cases instillations of silver preparations into the urethra are indicated. The more acute the process the less should be the strength of the bactericidal agent employed. Warmed solutions and frequent change of the preparation used are beneficial. The patients should be encouraged to pass urine before treatment. Diuretics and urinary disinfectants should be used. The rectum should be treated by small enemas of 15 c.cm. of 5 per cent. protargol solution. Treatment of the cervix should be preceded by removal of the mucus plug by suction. Intravenous injection of 10 c.cm. of a 1 per cent. solution of trypaflavine is a useful adjuvant. Applications of acriflavine locally to the vagina are good, but the dye must be carefully removed to prevent erosion of the epithelium. Vaginal massage, electrocoagulation of the cervical mucous membrane, and iontophoresis with silver

preparations have given excellent results. An ascending infection must be treated with absolute rest in the acute stages. In the subacute stages diathermy to the pelvis, non-specific protein therapy, and the use of specific vaccines are indicated. The latter are contraindicated in tuberculosis, metabolic disturbances, and heart failure. Cure can only be established following the use of the usual provocative measures and examination of intramenstrual secretions. The administration of follicular hormones orally or intramuscularly is indicated in cases of infantile vulvovaginitis in addition to local treatment.

147

Diphtheria Carriers

J. GOECKER (*Dtsch. med. Wschr.*, December 17, 1937, p. 1902) gives an account of an outbreak of diphtheria in the autumn of 1936 in an institution for children. A systematic examination for diphtheria bacilli showed that as many as twenty-eight of the ninety inmates were carriers. Various devices were employed to treat these carriers, the infected surfaces being swabbed with solutions of potassium permanganate and various other modern preparations. The author succeeded in ridding sixteen of the carriers of their diphtheria bacilli, but twelve remained refractory after an average observation period of forty-five days. He then tried tincture of mucidan, which contains a gelatine compound of formaldehyde, the action of which is said to be promoted by certain alkalis designed to facilitate exudation from the infected tissues. This preparation was painted on the tonsils in a 20 per cent. solution, or was introduced into the nose on tampons soaked in it. The mucidan was also administered as a spray. This preparation proved more effective than those employed earlier, ten of the twelve refractory carriers being sterilized by it. In the two cases in which the carrier state persisted after futile efforts lasting ninety days, tonsillectomy proved successful. No uniform relationship could be established between the size of the children's tonsils and the duration of the carrier state, which was uninfluenced by the injection of serum. It seemed also immaterial whether the carriers had or had not previously suffered from diphtheria.

148

Properties of Benzedrine

V. FRIIS-MÖLLER (*Ugeskr. Laeg.*, December 30, 1937, p. 1408) relates his experiences with benzedrine, which is sold in Denmark as "mecodrin." He has found it markedly effective in combating a craving for sleep, lassitude, and mental heaviness. Soon after it has been taken by the mouth it begins to induce a state of mental and physical well-being, lasting for five to six hours, after which the normal desire to sleep returns. In his own case the author has observed no untoward complications. In two cases the drug proved effective in steadying the nerves and promoting the mental efficiency of young men entering for examinations. In several cases good results were obtained by giving the drug for a few pre-menstrual days, which had previously been passed in a state of depression and tearfulness. In no case has the author found it necessary to give the drug daily for more than a fortnight, and he believes that its administration should always be under close medical supervision.

149 N. PETERSEN (*ibid.*, p. 1408) gives an account of a schoolmaster who suffered from narcolepsy, and who was much inconvenienced by attacks of drowsiness which overtook him at any time of the day. He had only slight warning of their onset, and they were so imperative that he felt absolutely obliged to sleep even when they overtook him in school. These attacks were quite brief, and after three to eight minutes of sleep he would wake up and be able to resume his work. After several other drugs had been given without effect, mecodrin was prescribed, and was successful in keeping him awake during school hours. The narcoleptic state promptly returned when the drug was discontinued.

MENFORMON TABLETS

to reverse menopausal changes

"Admittedly the statement that a morbid menopause is a deficiency disease is a bold one, but there is little difficulty in accepting this view, now that animal experiments have shown that one of the actions of oestrin is to inhibit the activity of that dynamo of function—the hypophysis. Moreover, since oestrogenic deficiency spells derangement of the whole endocrine system, correction of such deficiency will replace the normal inhibition of the anterior pituitary and re-coordinate the glandular system. The results obtained from the use of oestrogenic substances corroborate this view."

PRACTITIONER. Vol. 138, 60 (1937)

"It will be apparent that oral therapy is so dependable that it should be the method of choice. About 5 times as much needs to be given as by hypodermic injection."

J. AMER. MED. ASSOC. Vol. 104, 624 (1935)

To STRENGTHEN Nutritional Defences During "Epidemic Months"...

It is a truism that the period of greatest danger from infective organisms coincides with that of lowest "resistance," due to lack of sunshine and dietetic vitamins during the winter months. This is the time to prescribe Ostomalt. For growing children and for convalescents, Ostomalt supplies Vitamins A, B, C and D. Instead of tablespoon doses, the vitamin potency of Ostomalt makes teaspoonfuls quite enough. Instead of a "fishy" flavour, Ostomalt has a clean orange "tang" especially attractive to children.

OSTOMALT

The 4-Vitamin Malt Extract

Prices (except in Eire): Jars 1s 6d and 3s 6d.
Dispensary jars (more than 7 times as much as the 3-oz. jar). Less usual professional discount.

GLAXO LABORATORIES LTD., GREENFORD, MIDDLESEX. BYRON, 1938

ination; in some cases there was a macular subretinal haemorrhage, but in most, the condition being advanced, haemorrhages were less often noted. There is a high, greenish or almost black, sharply defined mound, later becoming white with the deposition of pigment and flatter. It followed senile changes in some cases or was associated with retinitis circinata. Microscopically there were secondary degenerative changes, with much proliferated pigment and fibrous tissue forming the mound; in many the lamina vitrea showed some pathological change. The aetiology of this condition has been stated to be inflammatory or vascular. A juvenile type tends to heal, leaving little or no changes or impairment of vision. The authors describe and illustrate cases they have examined.

Obstetrics and Gynaecology

156

Pruritus Vulvae

E. VAYSSIÈRE (*Gynéc. et Obstét.*, September, 1937, p. 209) presents a very full review of the aetiology and treatment of pruritus vulvae. He insists on the necessity for a full investigation of the cause of the condition before attempts at treatment are made, except in those very acute cases where immediate treatment is necessary to give quick relief to the sufferings of the patient. Of 190 cases observed by him, fifty-six were in women during the period of genital activity without menstrual troubles, seven were associated with diabetes, sixty-one coincided with pregnancy, thirty-five were attributed to endocrine dysfunction, and thirty-one were due to the menopause, whether physiological or surgical. Causes are classified as: (1) local—for example, leucorrhoea, trichomonas, monilia; (2) regional—for example, uterine, vesical, rectal, or other pelvic conditions; (3) general—for example, jaundice, albuminuria, and diabetes; and (4) hormonal, chiefly lack of ovarian secretion. For local treatment of acute crises cold acid sitz-baths are useful. A lotion containing phenol and chloral hydrate is advised. After the bath or the application of the lotion, powdering with sterilized talc is advocated. In the pruritus of pregnancy, in which there is local infection and some endocrine disturbance, acid or alkaline injections are given according to the infecting agent; silver nitrate 1 in 2,000 solution (mycoses), stovarsol pessaries (trichomonas), painting the vulva with silver nitrate 1 in 20 solution or gentian violet 1 in 100, are indicated. Hormonal treatment is frequently required in the form of intramuscular injections of oily solutions of dihydro-folliculin benzoate, 1,000 to 50,000 international units. The good results of hormonal treatment are often very quickly seen, but it is necessary to allow at least two months' treatment before admitting failure. Radiological or surgical treatment is rarely required.

157 Prevention of Post-operative Thrombosis

R. VORSTER (*Med. Welt*, October 16, 1937, p. 1463) has been using leeches regularly for the last four and a half years after every gynaecological operation, with a view to preventing post-operative thrombosis and embolism. Three to four leeches were applied to the thighs on the day following the operation even in very anaemic patients. In cases predisposed to embolism and thrombosis the leeches were applied again on the fourth day after the operation. The women were also made to wash themselves, comb their hair, and feed themselves as early as possible. Since the introduction of this method the author has not lost a single patient from embolism or thrombosis.

158

X-Ray Treatment of Sterility

I. I. KAPLAN (*Amer. J. Obstet. Gynec.*, September, 1937, p. 420) maintains that, provided always that no embryo is present, x-ray and radium therapy properly applied produces no harmful effect on future offspring, but is actively

curative of amenorrhoea and sterility. Menstruation was restored in seventy-six of Caplan's cases, though fifty-two remained unaffected. All had been previously examined, and treated by surgery or by endocrines, without avail. The ovaries were irradiated once weekly for three, sometimes four, successive weeks. Of the 128 cases in this series, eighty received irradiation of the pituitary, and five of the thyroid also. Menstruation was re-established in seventy-five, of whom forty-four became pregnant, seventeen have conceived more than once, five aborted; thirty-six patients gave birth to forty-seven living children in all, with one abnormal foetus stillborn. Amenorrhoea had existed up to fourteen years, sterility from one to eighteen years, in some of these patients. The oldest of the children is now 10½; all are perfectly normal. The mode of action of the x rays is still debatable. It is certain that irradiation of the pituitary has the effect of stimulation, and does not result in menstruation in cases with atrophic changes in the endometrium due to the absence of gonadotropic hormones. It seems also that persistent cystic follicles or a persistent corpus luteum might be destroyed by x rays, with consequent release of menstrual function.

Pathology

159 Tuberculosis of Bovine Origin in Poland

E. PIASECKA-ZEYLAND (*Rev. d'Hyg.*, October-November, 1937, p. 540) cultivated and typed 160 strains of tubercle bacilli from human patients at Poznan suffering from various forms of tuberculosis. Altogether eleven strains were found to be of the bovine type. Seven out of eighty-six strains came from tuberculous infants, and two of the remaining bovine strains came from abattoir workers suffering from tuberculosis of the skin. Since nine out of thirty-one samples of milk bought in the open market at Poznan contained tubercle bacilli, it is surprising that a higher proportion of bovine infections was not found among the patients examined. The reason for this is considered to be twofold: in the first place breast-feeding is the rule in Poland, and in the second place milk is generally boiled before being used for human consumption.

160 Mineral Residues in Silicotic Lungs

J. B. ROBERTSON, F. W. SIMSON, and A. S. STRACHAN (*S. Afr. J. med. Sci.*, October, 1937, p. 124) report with case notes ten complete analyses on silicotic lung residues obtained by the nitric acid sliming process. There was a general similarity between the results. Free silica was always present in association with material mineralogically allied to sericite in ratios varying from 5:1 to 1:1, but mostly about 2:1. Considerable variation in the P_2O_5 content was attributed to the treatment with nitric acid. The percentage of TiO_2 was greater than in mine dust, suggesting that this oxide is selectively retained by the lungs. Comparative analyses of the same material by the sliming process and by dry ignition indicated that there was considerable loss of aluminiferous material as the result of the acid treatment. The rate of development and the extent of the silicotic lesions apparently depended on the amount of dust inhaled and the rapidity of concentration of the dust in the lung tissue. In a second part of their paper the authors report determinations of the solubilities of quartz and mica particles of a fineness comparable to the particles in silicotic lungs, in sodium chloride-bicarbonate solutions isotonic with and having the same pH as blood serum. Ten times as much silica dissolved from quartz as from mica. The addition of protein (egg albumen) reduced the solubility of silica from quartz to about half that in the saline-bicarbonate solution. They conclude that if the solubility of minute mineral particles is essential to the production of silicosis, silica rather than a silicate appears to be the chief mineral concerned.

FOUR POINTS IN HÆMORRHOIDAL THERAPY

The well-recognized value of ANUSOL Suppositories in the medical treatment of hæmorrhoids is the result of a fourfold therapeutic effect :—

- 1 **PAIN IS RELIEVED**—not by the use of opiates or local anæsthetics but by reducing congestion and thus relieving pressure.
- 2 **CONGESTION IS REDUCED**—The emollient, protective and mildly astringent action of Anusol prevents irritation of the affected parts.
- 3 **BLEEDING IS CONTROLLED**—not by means of vaso-constrictors or strong styptics but by reducing congestion and consequent tension.
- 4 **CONSTIPATION IS RELIEVED**—The Anusol base soon melts at normal rectal temperature, softening the hardened fæces, thereby making evacuation easy and less painful.

These desirable qualities distinguish Anusol Suppositories and assure their efficacy in treatment.

Anusol is also available in ointment form in collapsible tube with nozzle.

Supplies for clinical trial sent on request.

Sinusitis in Older Children

ARGYROL

BRAND
SILVER
VITELLIN

Infections in older children with larger sinuses and relatively smaller ostia require special treatment in addition to the removal of constitutional disorders.

The most approved treatment consists of the use of suction, removal of adenoids, and nasal tampons of 10 per cent. solution of Argyrol—the standard in mucous membrane inflammations for many years.

Argyrol has peculiarly sedative, inflammation-allaying qualities, and its clinical successes of 30 years' duration may be easily accounted for by pertinent chemical facts.

The very great differences between Argyrol and other silver salts in silver ion and in hydrogen ion concentration (or alkalinity) no doubt have

much to do with the irritation noted by doctors when allegedly equivalent mild silver proteins are substituted. The pH and pAg of Argyrol are especially regulated for treatment of delicate mucous membranes. Insure the results you expect—specify "ARGYROL."

Voices of authority on the dietetic value of BREAD

Prof. RUSSELL H. CHITTENDEN, Ph.D., LL.D., D.Sc.

"A diet of bread leads to the secretion of a smaller volume of gastric juice than a corresponding weight of meat produces, but the juice secreted under the influence of bread is richer in pepsin and acid, i.e. it has a greater digestive action than the juice produced by meat."

BREAD for ENERGY

C.F.H.384

WHOOPIING COUGH

Detoxicated Whooping Cough Vaccine (Genatosan) has proved remarkably successful. Reports received from medical practitioners state that it usually reduces the frequency of the paroxysms after the first injection, and subsequent injections almost invariably clear up the condition. Owing to the elimination of the toxic elements of the germ during the process of manufacture, this vaccine may be given to infants and young children, in doses sufficiently large to produce the desired therapeutic effect, with an absence of harmful reaction.

The following is typical of many reports received from physicians:—

"I have been making a somewhat extensive use of your Detoxicated Vaccine for Whooping Cough, and am pleased to say that the results have been almost invariably gratifying. In nearly all my cases the very distressing symptoms have disappeared after the third injection." M.D.

Additional information regarding this Vaccine will gladly be supplied on request.

—the obvious solution to the psychological problem created by amputation of the breast is the

SALT AIR ARTIFICIAL BREAST AND BRASSIÈRE

THE handicap experienced by the patient who has undergone amputation of the breast is very real. It may even lead to abstinence from those social and other activities which are essential for her well-being. For this reason THE SALT AIR ARTIFICIAL BREAST is a welcome innovation. Reproducing the natural line of the bust, it removes all cause for embarrassment. THE SALT AIR ARTIFICIAL BREAST is very resilient, has a beautifully smooth surface, weighs only two ounces, and, because it retains its shape when wet and is easily dried afterwards, bathing can be indulged in quite confidently. It cannot slip out of position in any circumstances. Available complete with the Saltair Brassière, or supplied separately to be sewn into patient's own foundation garment if desired. Doctors are invited to write for further details of this unique surgical fitment.

WARM, DRY BEDS FOR OPERATION AND ACCIDENT CASES

In cases of sudden emergency and for everyday use, the "Thermega" Electrically-Heated Blanket is invaluable for providing warm, damp-free beds. Hospitals and Nursing Homes throughout the country use "Thermega." It is the one proven remedy for driving out dampness and ensuring warm beds at the turn of a switch.

The "Thermega" Electric Pad for local application is ideal for relief of pain and for replacing hot water bottles.

At all good stores, chemists, electricians; or from Thermega Limited, 51/53, Victoria Street, London, S.W.1.

It is vital that
blankets should be made by
specialized machinery.

THE ABSOLUTE COMFORT and security which the Deimel Underwear affords in the most trying climate is remarked upon by all its wearers. Those whose powers of resistance have been weakened by wearing unsuitable underwear derive new strength from Deimel Mesh Garments which absorb and eliminate perspiration quickly, and provide a dry climate about the body which enables the wearer to undergo extremes of heat and cold with comfort.

The above House, which was established in 1826, is an Institution for the care and treatment of persons suffering from mental diseases and nervous disorders. Certified voluntary and temporary patients are received. Separate houses for treatment and accommodation of special cases adjoin the Institution. There is a seaside branch, Kearsney Court, near Dover, to which patients may be sent for treatment or on holiday. Motor and carriage exercise is provided as required. Patients can avail themselves of a course of physical drill. Tennis courts. Entertainments, dances, and indoor amusements held throughout the year. Terms from £3 3s. per week. Illustrated prospectus and further particulars can be obtained from the Medical Superintendent.

CHEADLE ROYAL HOSPITAL

CHEADLE, CHESHIRE

This REGISTERED HOSPITAL, with a SEASIDE BRANCH at Colwyn Bay, N. Wales, is for the treatment and care of those of the Upper and Middle Classes suffering from MENTAL and NERVOUS DISEASES.

The Hospital is governed by a Committee appointed by the TRUSTEES of the Manchester Royal Infirmary. In addition to the Main Building there are separate villas. Extensive grounds. Hard and grass tennis courts, cricket and croquet grounds, and a court for badminton. There are also wireless installations. Golf may be had within easy distance. Occupational therapy.

VOLUNTARY, TEMPORARY, AND CERTIFIED PATIENTS received.

The Hospital is nine miles from Manchester, 20 minutes by rail from Liverpool, and 3½ hours from London.

For terms and further particulars apply to the Medical Superintendent, who may be seen in MANCHESTER by APPOINTMENT.

ST. ANDREW'S HOSPITAL FOR MENTAL DISORDERS NORTHAMPTON

FOR THE UPPER AND MIDDLE CLASSES ONLY

President: THE MOST HON. THE MARQUESS OF EXETER, C.M.G., A.D.C.

This Registered Hospital is situated in 120 acres of park and pleasure grounds. Voluntary patients, who are suffering from incipient mental disorders or wish to prevent recurrent attacks of mental trouble, temporary patients and certified patients of both sexes, are received for treatment. Careful clinical, biochemical bacteriological, and pathological examinations. Private rooms, with special nurses, male or female, in the Hospital or in one of the numerous villas in the grounds of the various branches can be provided.

WANTAGE HOUSE

This is a Reception Hospital in detached grounds, with a separate entrance, to which patients can be admitted. It is equipped with all the apparatus for the most modern treatment of Mental and Nervous Disorders. It contains special departments for hydrotherapy by various methods, including Turkish and Russian baths, the prolonged immersion bath, Vichy Douche, Scotch Douche, Electrical bath, Plombières treatment, etc. There is an Operating Theatre, a Dental Surgery, and X-ray room, an Ultra-Violet Apparatus, and a Department for Diathermy and High Frequency treatment. It also contains Laboratories for biochemical, bacteriological, and pathological research.

MOULTON PARK

Two miles from the Main Hospital there are several branch establishments and villas situated in a park and farm of 650 acres. Milk, meat, fruit, and vegetables are supplied to the Hospital from the farm, gardens, and orchards of Moulton Park. Occupation Therapy is a feature of this branch, and patients are given every facility for occupying themselves in farming, gardening, and fruit-growing.

BRYN-Y-NEUADD HALL

The seaside house of St. Andrew's Hospital is beautifully situated in a park of 330 acres, Llanfairfechan, amidst the finest scenery in North Wales. On the North-West side of the Estate, a mile off sea coast forms the boundary. Patients may visit this Branch for a short seaside change or for longer periods. The Hospital has its own private bathing house on the seashore. There is trout-fishing in the park.

At all the branches of the Hospital there are cricket grounds, football and hockey grounds, lawn tennis courts (grass and hard courts), croquet grounds, golf courses, and bowling greens. Ladies and gentlemen have their own gardens, and facilities are provided for handicrafts, such as carpentry, etc.

For terms and further particulars apply to the Medical Superintendent (Telephone No. 2356 and 2357 Northampton) who can be seen in London by appointment.

HILL END HOSPITAL AND CLINIC FOR THE PREVENTION AND TREATMENT OF MENTAL AND NERVOUS DISORDERS.

(20 miles from London)

Ladies suffering from all forms of MENTAL ILLNESS are received for treatment on modern lines, as Voluntary, Temporary, or Certified Private Patients at the Hill End Hospital. Convalescent or mild cases can be treated in a delightful country mansion with extensive grounds known as—

HIGHFIELD HALL,

situate about a mile away from the Hospital. FEES: TWO TO THREE GUINEAS PER WEEK.

For further particulars, apply to the Medical Supt., W. J. T. KIMBER, L.R.C.P., D.P.M.
ST. ALBANS, HERTS.

BARNWOOD HOUSE GLOUCESTER

A REGISTERED HOSPITAL for the CARE and TREATMENT OF LADIES and GENTLEMEN suffering from NERVOUS and MENTAL DISORDERS. Within two miles of the G.W. Railway and L.M. & S. Railway Stations at Gloucester, the Hospital is easily accessible by rail from London and all parts of the United Kingdom. It is beautifully situated at the foot of the Cotswold Hills, and stands in its own grounds of over 300 acres. Voluntary Patients of both sexes are also received for treatment. Special accommodation for Lady Voluntary Patients is also provided at the MANOR HOUSE, which has its own private grounds and is entirely separate from the Main Hospital. For particulars as to terms, etc., apply to G. W. T. H. FLEMING, M.R.C.S., L.R.C.P., D.P.M., Medical Supt.
Telephone: No. 6207 Barnwood.

CHISWICK HOUSE, PINNER, MIDDLESEX

Telephone: PINNER 251.

A Private Hospital for the Treatment and Care of Mental and Nervous Illnesses in both sexes.

A modern country house, 12 miles from Marble Arch, in beautiful secluded grounds. Fees from 10 guineas per week, inclusive. Cases under Certificate. Voluntary and Temporary patients received for treatment.
Douglas Macaulay, M.D., D.P.M.

TANCRED'S STUDENTSHIPS.

Shortly after midsummer next the Governors and Trustees propose to ELECT ONE STUDENT IN PHYSIC at GONVILLE and CAIUS COLLEGE, CAMBRIDGE AND ONE STUDENT IN DIVINITY at CHRIST'S COLLEGE, OXFORD AND ONE STUDENT IN...

Candidates must have been born in England, Scotland or Wales and be members of the Church of England, unmarried, and within the ages of 17 and 20 years for Physic and Divinity and 18 and 23 for Law.

After 1938 the Election will take place about Whitsuntide, and the age limit for the Law Studentship (which will be awarded without examination) will be 19 and 23 years.

The annual stipend of each student is £100. The last day for sending in Petitions this year is May 15th.

Applications, stating kind of Studentship and mentioning this paper, should be made to the Clerk, Mr. CHAMBERS, 28, Lincoln's Inn Fields, London, W.C.2.

MANCHESTER ROYAL INFIRMARY

POST-GRADUATE DEMONSTRATIONS.

Clinical Demonstrations will be given on the Wards on Fridays at 4.15 p.m. by members of the Honorary Medical Staff, commencing February 23rd and ending May 27th. No fee is charged and the Demonstrations are open to all medical graduates.

EXPERIENCED COACHING IN PHYSIOLOGY, Pathology, and Medicine, by M.D. Lond (Hons.), M.R.C.P.Lond., B.Sc., Physiology, Lond. All exams. Classes held.—Address, No 7902, B.M.A. House, Tavistock Square, W.C.1.

ROYAL NAVAL MEDICAL SERVICE.

Vacancies exist for Medical Officers in the Royal Navy, and applications are invited for entry in April, 1938.

Candidates below the age of 28 years are preferred, and they must be registered under the Medical Acts. No examination in professional subjects will be held, but candidates will be required to attend for interview by a Selection Board.

Selected candidates will be entered for Service for a period of three years in the first instance, which may be extended to five years at the discretion of the Admiralty.

At the end of three years' service officers may retire with a gratuity of £400, but those who serve for five years will receive £1,000.

At the end of five years' Short Service permanent commissions will be given to selected officers who wish to make the Naval Medical Service their permanent career. Officers transferred to the permanent list will receive a gratuity of £1,000 (less Income Tax).

Opportunities are available for officers on the permanent list to specialise, and ample provision is made for Post-Graduate study.

Copies of the regulations for entry and conditions of service, including rates of pay and allowances, may be obtained from the Medical Director-General of the Navy, Admiralty, S.W.1, and from the Deans of all Medical Schools.

Applications for entry from intending candidates must be received not later than February 28th, 1938.

LANCASHIRE COUNTY COUNCIL SCHOOL MEDICAL AND CHILD WELFARE DEPARTMENT.

APPOINTMENT OF AN ASSISTANT COUNTY MEDICAL OFFICER.

The Lancashire County Council invite applications from registered Medical Practitioners for the post of an Assistant County Medical Officer.

Applicants must not be over 40 years of age and must possess the Diploma in Public Health.

The duties of the post include the Medical Inspection of school children; work under the Maternity and Child Welfare Acts; general Public Health work; and such other duties as may from time to time be imposed by the County Council.

The candidate appointed will be required to devote his whole time to the service of the County Council, to pass a medical examination, and to contribute to the Council's Superannuation Fund. The salary will be £800 a year, rising subject to satisfactory service, by annual increments of £50, to a maximum of £1,000 a year, together with travelling expenses.

Applications must be made upon a form which can be obtained, together with further particulars, from the County Medical Officer of Health, School Medical and Child Welfare Department, County Offices, Preston, to whom the completed forms should be returned not later than March 31, 1938. All communications must be endorsed "Assistant County Medical Officer." Any form of canvassing is strictly forbidden, and will disqualify.

County Offices, GEORGE ETHERTON,
Preston, Clerk of the County Council.
February, 1938.

COUNTY BOROUGH OF HUDDERSFIELD. ASSISTANT SCHOOL MEDICAL OFFICER.

Applications are invited for the above post, for which a good knowledge of diseases of children and experience in bacteriology are essential. Salary according to scale—£500 per annum increasing to £700. The commencing salary will be based on the candidate's previous experience.

The post is designated under the Superannuation Act, 1922, and the appointment, therefore, is subject to a satisfactory medical examination.

Applications, stating age and giving full particulars regarding training, qualifications, and appointments held since qualification, should be forwarded to the Medical Officer of Health, along with copies of two recent testimonials, so as to reach him not later than Friday, February 25th.

CITY OF PLYMOUTH. CITY GENERAL HOSPITAL (570 Beds.)

Applications are invited from duly qualified and registered medical practitioners for the following posts:—

(1) ASSISTANT MEDICAL OFFICER.

Salary at the rate of £350 per annum, with full residential emoluments. All fees received by the Officer must be refunded to the Council.

The appointment will be for a period of twelve months, terminable by one month's notice on either side. Previous experience in a maternity hospital or in the maternity wards of a general hospital is essential. As the duties of the post also include general work, preference will be given to candidates who have had such experience.

(2) JUNIOR ASSISTANT MEDICAL OFFICER.

Salary at the rate of £250 per annum, with full residential emoluments. All fees received by the Officer must be refunded to the Council.

The appointment will be for a period of six months in the first instance, and renewable for a further period of six months, and will be terminable by one month's notice on either side.

Forms of application may be obtained from the undersigned, and should be forwarded, together with copies of not more than three recent testimonials, not later than February 25th.

Town Hall, T. PEIRSON,
Stonehouse, Medical Officer of Health.
Plymouth, February 5th, 1938.

CITY OF BIRMINGHAM. SEELY OAK HOSPITAL. (520 Beds.)

JUNIOR MEDICAL OFFICER (male).

Applications are invited from fully-qualified medical practitioners for the whole-time appointment of Junior Medical Officer (male) at the Seely Oak Hospital, Birmingham. The appointment will be for a period of six months in the first instance, but may be extended at the end of that time for a further period of not exceeding six months.

Salary at the rate of £200 per annum, and full residential emoluments.

Further particulars may be obtained from the Medical Superintendent at Seely Oak Hospital, to whom applications, stating age, experience and qualifications, with copies of recent testimonials, should be forwarded not later than Wednesday, February 23rd, 1938.

The Council House, F. H. C. WILTSHIRE,
Birmingham, Town Clerk.
February, 1938.

ESSEX COUNTY COUNCIL. JUNIOR ASSISTANT MEDICAL OFFICER.

The County Council of the Administrative County of Essex invite applications for the appointment of Junior Assistant Medical Officer at the Black Notley Sanatorium, near Braintree.

This Sanatorium has 300 beds for the treatment of pulmonary and non-pulmonary tuberculosis in men, women and children, and has all modern facilities for diagnosis and treatment, together with a staff of seven Specialists.

The appointment is for a period of one year, and the salary will be at the rate of £250 per annum, together with board, lodging and laundry.

The successful applicant will be required to pass a medical examination, and will be subject to the Council's Sick Pay Rules and Regulations, a copy of which will be forwarded on application.

Applications in candidate's own handwriting, stating age, qualifications and experience, accompanied by copies of not more than three recent testimonials (which will not be returned), should be addressed to me and delivered at the County Hall, Chelmsford not later than 10 a.m. on Thursday, February 24th, 1938.

County Hall, E. S. HOLCROFT,
Chelmsford, Clerk of the County Council.
February 7th, 1938.

COUNTY BOROUGH OF DERBY DERBY CITY HOSPITAL. ASSISTANT RESIDENT MEDICAL OFFICERS.

Applications are invited for the post of Assistant Resident Medical Officer (male) at the above hospital of 300 beds. This hospital provides treatment for acute medical and surgical cases, obstetrics and children's diseases, etc. Vacancies will occur near the end of March and the end of April, and applicants should state when they are free to commence duties.

Candidates must be registered in Medicine and Surgery. The appointment is for a period of six months; two months' notice of termination of duties may be given on either side.

Salary at the rate of £200 per annum, with board and residence.

Applications, stating age, experience, and accompanied by three recent testimonials, should be sent to the undersigned as soon as possible.

Public Health Department, GORDON LILICO,
1, Derwent Street, Medical Officer of Health.

POST-GRADUATE COURSE IN VENEREAL DISEASES

LONDON COUNTY COUNCIL.

(WHITECHAPEL) CLINIC.

TURNER STREET, E.1 (ADJOINING THE
LONDON HOSPITAL).

A THREE MONTHS' COURSE OF INSTRUCTION IN MODERN METHODS IN THE DIAGNOSIS AND TREATMENT OF VENEREAL DISEASES will be given by Lieut.-Colonel E. T. BURKE, D.S.O., the Director of the Clinic, during March, April and May, 1938. Attendance at this course will qualify, subject to the other conditions in the Regulations of the Ministry of Health, for the Certificate enabling the possessor to hold the post of a Venereal Diseases Officer under the Council of a County or County Borough. The course will consist of twenty-five systematic lectures, accompanied by lantern demonstrations, on Mondays and Thursdays at 2.30 p.m., beginning on February 28th and ending on May 26th. Every Wednesday at 2 p.m. cases will be demonstrated. Those taking the course will also attend the practice of the Clinic in order to obtain tuition in intravenous injections, etc. During the three months 130 hours of attendance must be put in.

Those intending to take the course must send their names to the Director on or before February 21st, 1938. Fee: £10 10s.

CITY OF MANCHESTER.

ROOTH HALL HOSPITAL FOR CHILDREN.
(760 Beds.)

The Public Health Committee invites applications from registered medical men for the post of **RESIDENT ASSISTANT MEDICAL OFFICER** at the above-named hospital.

The salary for the appointment is £200 per annum, with board, residence and laundry in addition, subject to the Manchester Corporation conditions of service.

The appointment will be made in the first instance for a period of six months, renewable for a further six months, but not renewable thereafter.

Full information and forms of application may be obtained from the Medical Officer of Health, Sunlight House, Quay Street, Manchester, 3, and applications for the post must be received by him not later than March 5th, 1938.

Town Hall, F. E. WARBRECK-HOWELL,
Manchester, 2. Town Clerk.
February 2nd, 1938.

UMTATA HOSPITAL BOARD. SIR HENRY ELLIOT HOSPITAL.

APPOINTMENT OF SENIOR RESIDENT :
MEDICAL OFFICER.

Applications are invited from qualified Registered Medical Practitioners for the above-mentioned post. The salary attached to this position, which is whole-time, is at the rate of £600 per annum, plus free house, water, light and sanitation. A double-storied dwelling-house is shortly to be erected in which the successful applicant will be required to reside, but pending its completion he will be allowed an amount of £10 per month in lieu of quarters and incidental costs.

The successful applicant is to assume duty on July 1st, 1938, and to enter into contract of service for three years (which may be renewed), the first year to be on probation.

The Hospital has 154 beds (22 European, 112 Native), but this accommodation will be increased by approximately 60 beds in the near future. Duties include assisting at operations, anaesthetics, radiology, the general ward work of a resident medical officer, lecturing to nurses, and the general superintendence of the whole Hospital.

Applicants to state full particulars of:
(1) Their Medical and, in particular, Radiological and Surgical experience.

(2) Nationality, age, and whether married or single.

(3) Whether fully conversant with both English and Afrikaans.

Applications, with copies of three recent testimonials and health certificate, must be lodged with the undersigned not later than noon on March 15th, 1938.

Umtata, C. E. BEVAN,
Cape Province, South Africa. Secretary

BOROUGH OF CHATHAM.

ASSISTANT MEDICAL OFFICER OF HEALTH
AND ASSISTANT SCHOOL MEDICAL
OFFICER.

Applications for the above post are invited from registered medical practitioners (male or female), under the age of 45 and holding the D.P.H. or its equivalent.

The commencing salary will be £500 p.a., rising, subject to satisfactory service, by annual increments of £25 to £700 per annum.

The post is subject to the provisions of the Local Government and Other Officers' Superannuation Act, 1922, and the successful candidate passing a medical examination.

The person appointed will be required to devote his or her whole time to the duties of the office, to act under the direction and supervision of the Medical Officer of Health, who is also School Medical Officer, and must have had at least three years experience subsequent to graduation. Experience in School Medical Inspection, Refraction, Dental Anaesthetics, Ante-Natal and Child Welfare Clinics and Diphtheria Immunization is very desirable, and full details of such experience should be given in the application.

The duties of the office will be chiefly Medical Officer for the various Clinics, and will include appointment, subject to consent of Minister of Health, as Deputy Medical Officer of Health.

Applications, stating age, qualification and experience, together with copies of not more than three recent testimonials, must reach me by 10 a.m. on Tuesday, February 22nd, 1938.

Canvassing, directly or indirectly, will disqualify.

Town Hall, EDWARD B. LEE,
Chatham. Town Clerk.

February 12th, 1938.

CITY OF BIRMINGHAM. COLESHILL HALL.

DEPUTY MEDICAL SUPERINTENDENT.

Coleshill Hall, a colony for Mental Defectives of all ages and both sexes, consists of two divisions, five miles apart, situated at Colehill and Marston Green respectively, each about ten miles from Birmingham.

Applications are invited for the whole-time appointment of Deputy Medical Superintendent for the Colony, aged 40 to 45, with experience in institutional administration. Salary according to experience (Scale £500-£700 per annum), subject to satisfactory service, plus emoluments consisting of unfurnished house, fuel, light and laundry, valued for superannuation purposes at £200 per annum. An additional £50 per annum will be granted if holding a recognized qualification in psychological medicine. All fees, allowances and remunerations received other than the foregoing must be repaid to the City Council.

The candidate appointed will be required to pass satisfactorily a medical examination and to be subject to the provisions of the Asylum Officers' Superannuation Act, 1909, as modified by the Asylums and Certified Institutions (Officers' Pensions) Act, 1918. The appointment will be subject to one month's notice on either side.

Application forms may be obtained from the Medical Superintendent, Colehill Hall, Colehill, near Birmingham, and must be returned to him not later than Monday, March 7th, 1938.

Council House, F. H. C. WILTSHIRE,
Birmingham, 1. Town Clerk

SEATON VALLEY URBAN DISTRICT COUNCIL.
WHITLEY AND MONKSEATON URBAN DISTRICT COUNCIL.
LONGBENTON URBAN DISTRICT COUNCIL.

APPOINTMENT OF WHOLE-TIME MEDICAL OFFICER OF HEALTH.

Applications are invited for the appointment of a Whole-time Medical Officer of Health for the combined area consisting of the above-mentioned Urban Areas, at a commencing salary of £850 per annum, plus car or travelling allowances, in the first instance amounting to £100 per annum. The Medical Officer appointed will be required to furnish to the Joint Committee a record of his mileage and out-of-pocket expenses at the end of each twelve months, when the question of the expenses to be paid during the ensuing year will be considered.

The successful applicant will also be required to serve as Medical Superintendent of the Earsdon Joint Isolation Hospital Board, which Board receives and treats the whole of the infectious diseases occurring within the above area, together with the Boroughs of Blith and Walswood. The additional salary to be paid in connection with the Hospital appointment will be £200 per annum.

The total population of the three combined areas is 76,491; the population of the Hospital District is 15,526.

Applicants must be registered in the Medical Register as a holder of a Diploma in Sanitary Science, Public Health or State Medicine, in addition to the statutory qualifications, and the successful applicant shall be restricted by the terms of his employment from engaging in private practice as a Medical Practitioner.

The successful applicant will be required to submit to the Ministry of Health and the County Council the appropriate information required under the Local Government Act, 1933, and the Sanitary Officers' (Orders, Letters and Circulars), 1933, report to and attend the appropriate Committee of the above authorities, perform the duties imposed on a Medical Officer of Health by statute and by any orders, regulations or directions from time to time made or given by the Minister and any Byelaws or instructions of the Local Authorities applicable to him.

The appointment will be subject to the provisions of the Local Government and Other Officers' Superannuation Act, 1922, and to the passing of a medical examination.

The appointment will commence on the first day of August, 1938, and may be determined by the Medical Officer of Health appointed by three months' notice.

The successful applicant will be required to reside in the area above mentioned.

Applications, stating age and qualifications, together with copies of not more than three recent testimonials, to be sent in to the undersigned by first post on Saturday, March 19th, 1938.

Dated the 11th day of February 1938.
Council Offices, **ARTHUR S. RUDDOCK,**
Whitley Bay. Clerk to the Joint Committee

LANCASHIRE COUNTY COUNCIL.
BIDDULPH GRANGE ORTHOPAEDIC HOSPITAL.

Applications are invited from duly qualified and registered Medical Practitioners for the following posts at the above Hospital, which contains 85 beds:—

SENIOR HOUSE SURGEON (duties to commence May 1st), salary £250 per annum, together with board, residence and laundry. Candidates must have had experience in a general hospital. Preference will be given to candidates who have had orthopaedic experience.

JUNIOR HOUSE SURGEON (duties to commence April 1st).—Salary £200 per annum, together with board, residence and laundry. Preference will be given to candidates who have held resident hospital appointments, and who are competent anaesthetists.

Both appointments will be for a period of six months in the first instance, and for a further six months at the option of the Council, but will not be renewable after that time.

Applications, with copies of two recent testimonials, should be sent, not later than March 3rd, 1938, to Dr. F. HALL, School Medical and Child Welfare Department, County Offices, Preston.

CITY OF SHEFFIELD.
CITY GENERAL HOSPITAL.

JUNIOR ASSISTANT MEDICAL OFFICER.

Applications are invited from duly qualified medical men for the appointment of Junior Assistant Medical Officer at the above hospital.

The Medical Officer appointed will be required to take duty in the Medical, Surgical or Maternity Departments, as directed by the Medical Superintendent.

The appointment will be for one year only, and the salary offered is £200 per annum, with the usual residential allowances.

Previous hospital experience desirable.
Applications, stating age, qualifications and experience, and accompanied by not more than three testimonials of recent date, should be sent to the Medical Superintendent, City General Hospital, Sheffield, 5.

CANNOCK URBAN DISTRICT COUNCIL.
APPOINTMENT OF ASSISTANT MEDICAL OFFICER OF HEALTH AND ASSISTANT SCHOOL MEDICAL OFFICER.

The above Council invites applications from registered medical practitioners, of under 35 years of age, for the above-named post. The salary will be at the rate of £500 per annum, rising, subject to satisfactory service, by annual increments of £25 to £700 per annum, plus a travelling allowance of £30 per annum. Applicants must have had at least three years' experience in the practice of their own profession and special experience of practical midwifery, ante-natal, and Maternity and Child Welfare work, and hold a diploma in Public Health.

The person appointed will be required to devote the whole of his or her time to the duties, which will be performed under the direction of the Medical Officer of Health, and will consist chiefly of School Medical and Maternity and Child Welfare work, together with such other duties related to Public Health as may be required.

The appointment is subject to the approval of the Board of Education, and will be determinable by one month's notice on either side.

The Council has, subject to the approval of the Ministry of Health, decided to adopt the Local Government and Other Officers' Superannuation Act, 1922, as from April 1st, 1938, and the successful candidate will be required satisfactorily to pass a medical examination.

Sealed applications, on forms to be obtained from the undersigned (upon receipt of a stamped addressed footslop envelope), accompanied by copies of three recent testimonials and endorsed "Assistant Medical Officer of Health," must be delivered to the undersigned not later than Wednesday, February 23rd.

Canvassing, directly or indirectly, will be deemed a disqualification.
Council House, **WM. C. SPEEDY,**
The Green, Cannock. Clerk of the Council.
February, 1938.

BARRY URBAN DISTRICT COUNCIL.
ACCIDENT AND SURGICAL HOSPITAL.

Applications are invited for the under-mentioned positions:

(a) **RESIDENT SURGICAL OFFICER** (to commence duties at noon as possible).
Salary at the rate of £150 per annum, rising by two increments of £50 per annum to £450, together with board and lodging.

(b) **HOUSE SURGEON** (male, duly qualified and registered to commence duties immediately). Salary £150 per annum, with board and lodging.

The appointment of the Resident Surgical Officer is terminable by three months' notice on either side, and that of the House Surgeon will be for a period of six months; to be renewed, if thought fit, for a further period of six months, but not for any subsequent period.

Candidates for the position of Resident Surgical Officer must be capable of performing major surgical operations. Preference will be given to applicants holding higher surgical qualifications and able to assist in carrying out the X-ray work of the Hospital. This appointment is subject to the provisions of the Local Government and Other Officers' Superannuation Act, 1922, and the successful candidate will be required to pass a medical examination.

The successful candidates will act under the direction of the Medical Superintendent and the Surgeon.

Applications, stating age and full particulars with regard to experience, and copies of three recent testimonials, to be sent to Dr. E. I. DAVIS, Medical Officer of Health, Public Health Office, Barry, Glam., so as to reach him not later than March 4th, 1938.

Council Offices, **T. D. HOWELLS,**
Barry. Clerk to the Council.
February 14th, 1938.

JOINT COMMITTEE OF THE COUNTY COUNCILS OF DURHAM AND NORTHUMBERLAND AND THE COUNTY BOROUGH COUNCILS OF GATESHEAD AND NEWCASTLE-UPON-TYNE.

HOUSE SURGEON AND JUNIOR CLINICAL ASSISTANT (Male, non-resident).

Applications are invited from duly qualified Medical Practitioners for the post of House Surgeon and Junior Clinical Assistant to the Joint Committee of Venereal Diseases Clinics, situated at beds in the Newcastle General Hospital. Duties include assistance in the male and female out-patients' departments and in the in-patients' departments, and commence April 1st, 1938. Appointment is for one year. Salary £150 per annum, plus an allowance of £100 per annum in lieu of residential expenses (if any) and will be provided when on duty. Applications, stating age, nationality, qualifications, special experience in Venereal Disease work (if any) should be forwarded to Dr. A. E. W. McLachlan, Clinical Medical Officer, Joint Committee's Clinic, Newcastle General Hospital, Westgate Road, Newcastle-upon-Tyne, 4 on or before February 26th, 1938.

COUNTY COUNCIL OF MIDDLESEX. PHYSICIAN—GRADE I. REDHILL COUNTY HOSPITAL, EDGWARE.

Applications are invited from registered medical practitioners for the above appointment on the pensionable staff. The appointment is a senior one in the Council's general hospital service, and applicants are expected to be medical men or women of high qualifications and professional attainments, who are devoting their time wholly or chiefly to the practice of clinical medicine. The officer appointed will work under the direction of the Medical Superintendent of the Hospital and will give his whole time to the duties of the post. He must be prepared to undertake the teaching of nurses and, if required, of students and to carry out such other duties as the Council may from time to time direct.

The Hospital is one of 225 beds for acute medical and surgical cases and for maternity. Large extension of over 300 further beds are nearing completion. In addition to a full-time physician, surgeon, obstetrician and pathologist, there is a resident medical staff of five and a part-time radiologist, pathologist, and dental surgeon.

Salary £1,000 per annum, rising by annual increments of £50 to £1,500 per annum. The salary is inclusive and any fees received by the officer appointed must be paid over to the Council.

The appointment is non-resident, but the successful candidate will be required to reside within a short distance of the Hospital. The appointment, which will be subject to medical examination, will be held during the pleasure of the Council, and is terminable by three months' notice on either side.

Applications, stating age, qualifications, and experience, together with copies of not more than three recent testimonials, must be received by the undersigned not later than February 26th. Relationship to any member or officer of the Council must be disclosed in the application. Application forms are not provided. Envelopes must be endorsed "Physician, Redhill County Hospital".

Canvassing, directly or indirectly, will be a disqualification.

C. W. RADCLIFFE, "Z,"
Clerk of the County Council.

Middlesex Guildhall,
Westminster, S.W.1

February 3rd, 1938.

COUNTY BOROUGH OF DERBY. DERBY CITY HOSPITAL.

SENIOR ASSISTANT MEDICAL OFFICER (RESIDENT).

A vacancy as Senior Assistant Medical Officer (male) will occur, at the beginning of April, at the above Hospital of 300 beds for the treatment of acute medical and surgical cases, obstetrics and children's diseases, etc., and applications are invited for the post.

Candidates, who must be registered in Medicine and in Surgery and have held resident appointments in a General Hospital, must not exceed 40 years of age. The Officer appointed will work under the control of the Medical Superintendent, and will devote his whole time to the official duties, which may include acting as deputy to the Medical Superintendent.

Salary at the rate of £350 per annum, rising by annual increments of £25 to £450, with board and residence.

The appointment (determinable by two months' notice on either side) is subject to the provisions of the Local Government and Other Officers' Superannuation Act, 1922, and the successful candidate will be required to pass a medical examination.

Applications, stating age, qualifications and previous experience, and accompanied by copies of three recent testimonials, should be sent to the undersigned as soon as possible.

Public Health Department, GORDON LILICO,
1, Derwent Street, Medical Officer of Health
Derby.

COUNTY OF THE CITY OF WORCESTER. ASSISTANT MEDICAL OFFICER (FEMALE)

Applications are invited for the above appointment from women of not more than 35 years of age, who are duly qualified Medical Practitioners holding a Diploma in Public Health.

The duties will include work under the School Medical Service and the Maternity and Child Welfare Service, and experience in this work is desirable. Special experience in refraction and ante-natal work will be an advantage.

The Officer appointed will work under the direction of the Medical Officer of Health and will be required to assist him in other duties as directed.

The salary offered is £500, rising by annual increments of £25 to £700, and the post is designated for purposes of superannuation.

Further particulars and a form of application may be obtained from the Medical Officer of Health, to whom applications should be returned not later than March 5th.

Canvassing, directly or indirectly will be a disqualification.

C. H. DIGBY-SEYMOUR,
Town Clerk

Worcester
February, 1938

COUNTY COUNCIL OF MIDDLESEX. OBSTETRIC SURGEON.

Applications are invited from registered Medical Practitioners for the appointment on the pensionable staff of an Obstetric Surgeon, Grade II, at West Middlesex County Hospital, Isleworth. The appointment is a senior one in the Council's general hospital service, and applicants are expected to be medical men or women of high qualifications and professional attainments, who have devoted their time wholly or chiefly to the practice of obstetrics and gynaecology. The successful candidate will work under the direction of the Medical Superintendent of the Hospital, and the whole of his time must be given to his official duties. He must be prepared to undertake the teaching of midwives and students, if required, and to carry out such other duties as the County Council may from time to time direct.

Salary £650 per annum, rising by annual increments of £50 to £900; and after eight years' service in this grade, two additional annual increments of £50 each. The salary is inclusive, and any fees received by the officer appointed must be paid over to the County Council.

The appointment is non-resident, and the successful candidate will be required to reside within a short distance of the Hospital. In the case of an unmarried officer, if accommodation is available, board, lodging, laundry, and service may be provided by the County Council, and in this event a deduction of £150 per annum will be made from the officer's salary.

The appointment, which will be subject to medical examination, will be held during the pleasure of the Council, and is terminable by three months' notice on either side.

Applications, stating age, qualifications, and experience, together with copies of not more than three recent testimonials, must be received by the undersigned not later than February 26th. Relationship to any member or officer of the Council must be disclosed in the application. Application forms are not provided. Envelopes must be endorsed "Obstetric Surgeon, West Middlesex County Hospital".

Canvassing, directly or indirectly, will be a disqualification.

C. W. RADCLIFFE, "Z,"
Clerk of the County Council.

Middlesex Guildhall,
Westminster, S.W.1

February 3rd 1938.

URBAN DISTRICT COUNCIL OF CHEADLE AND GATLEY.

APPOINTMENT OF MEDICAL OFFICER OF HEALTH.

The Urban District Council of Cheadle and Gatley invite applications for the appointment of a Medical Officer of Health.

The Officer appointed will also act under the Cheshire Education Committee as Assistant School Medical Officer for the Urban District of Cheadle and Gatley and a surrounding area.

Every candidate must not be less than 28 years and not exceeding 45 years of age, and must be a duly qualified Medical Practitioner and registered in the Medical Register as the holder of a Diploma in Sanitary Science, Public Health, or State Medicine.

The salary will be at the rate of £800 per annum, with a travelling allowance.

Office accommodation will be provided by the Council.

The person appointed will be required to devote the whole of his time to the performance of the duties of his office, and he will not be permitted to engage in private practice as a Medical Practitioner. He will be required to enter into an Agreement, and also to reside within the Urban District.

The appointment will be made subject to the approval of the Minister of Health, the provisions of Section 110 of the Local Government Act, 1933, and the Sanitary Officers' (Outside London) Regulations, 1935.

Full particulars of the appointment and forms of application can be obtained from the undersigned.

Application forms, duly completed and endorsed "Medical Officer of Health, etc.," together with copies of three recent testimonials, must be delivered to the undersigned not later than the first post on Monday, March 7th, 1938.

Council Offices, W. TIPHERLEY,
19, High Street, Clerk to the Council.
Cheadle, Cheshire.
February 10th, 1938.

CITY OF EDINBURGH. PUBLIC HEALTH DEPARTMENT. EASTERN GENERAL HOSPITAL

Vacancies exist at this Hospital for TWO RESIDENT MEDICAL OFFICERS at a salary of £100 per annum, with apartments, board, laundry, etc. The appointments will be made for a period of six months commencing April 1st.

Applications, giving age, qualifications, and enclosing copies of testimonials, should be addressed to the Medical Officer of Health, Johnston Terrace, Edinburgh

COUNTY COUNCIL OF MIDDLESEX. RESIDENT CASUALTY MEDICAL OFFICER.

Applications are invited for the above appointment at West Middlesex County Hospital, Isleworth. Candidates must be registered medical practitioners who have held the post of both house physician and house surgeon at a general hospital, and have had considerable all-round experience.

Salary £350 per annum, with board, lodging and laundry, valued at £100 per annum.

The officer appointed will be required to deal with casualties and admissions to the hospital, and to carry out such other duties as may be allotted to him.

The appointment, which does not at present carry any superannuation rights, will be subject to medical examination, is for a period of six months in the first instance, and is terminable by one month's notice on either side.

The officer appointed will work under the direction of the Medical Superintendent and will devote his whole time to official duties.

Applications, stating age, qualifications, and experience, together with copies of not more than three recent testimonials, must be received by the undersigned not later than February 26th. Application forms are not provided. Envelopes must be endorsed "Casualty Medical Officer, West Middlesex County Hospital". Relationship to any member or officer of the Council must be disclosed in the application.

Canvassing, directly or indirectly, will be a disqualification.

C. W. RADCLIFFE, "Z,"

Clerk of the County Council.
Middlesex Guildhall, Westminster, S.W.1.
February 1st, 1938.

LONDON HOSPITAL E.1.

There is a vacancy for the post of ASSISTANT PHYSICIAN at this Hospital.

Candidates must be Members of the Royal College of Physicians in London.

Applications should be sent to the House Governor, and should arrive not later than Saturday, March 12th, 1938.

ARTHUR G. ELLIOTT,
House Governor.

LONDON HOSPITAL, E.1.

A vacancy occurs for the post of PHYSICIAN to the London Hospital. An Assistant Physician is a candidate for the post.

ARTHUR G. ELLIOTT,
House Governor.

WEST LONDON HOSPITAL, Hammermith Road, W.6 (239 Beds).

Required, one HOUSE PHYSICIAN and one HOUSE SURGEON. The duties of the House Physician include some work in the Children's Department, and the House Surgeon will have some work in the Genito-Urinary Department. These appointments (males) are tenable for six months from April 1st next, subject to one month's notice on either side. Salary at the rate of £100 a year, with board, lodgings and laundry allowance. Candidates must be registered under the Medical Act.

Applications (which must be made on printed forms obtained from me) must reach me not later than the first post on Wednesday, March 16th. Selected candidates will be required to call upon such Members of the Medical Staff as directed, to be in attendance at the Medical Council meeting on Friday March 25th, at 4.30 p.m., and the House Committee meeting at 5 p.m. the same day, when the appointments will be made.

H. A. MADGE, Secretary.

THE CHILDREN'S HOSPITAL (King Edward VII Memorial), Birmingham, 16.

RESIDENT MEDICAL OFFICER.

Applications are invited for the above post. Candidates must be qualified and registered, and have held a responsible Resident appointment at a teaching Hospital. The salary is at the rate of £175 per annum, with board, residence and laundry. The appointment is tenable for one year, and the Officer is eligible for re-election for a second year. Candidates should forward their applications, with Certificate of Registration, and any credentials which they may desire to offer, to the undersigned on or before March 5th, 1938.

Owing to the resignation of the present holder of the office, the duties will commence forthwith.

HAROLD F. SHRIMPTON,
February 14th, 1938. House Governor.

ST. BARTHOLOMEW'S HOSPITAL.

RESIDENT ASSISTANT PHYSICIAN-ACCOCHEUR AND DEMONSTRATOR OF PRACTICAL MIDWIFERY.

Applications are invited for the post of Resident Assistant Physician-Accoucheur and Demonstrator of Practical Midwifery.

Candidates must be Fellows of the Royal College of Surgeons of England.

The salary attached to the Office is fifty guineas per annum, with residence in the Hospital, plus £1,000 per annum payable by the Medical College.

Appointment will be made for one year as from July 1st, 1938, with eligibility for re-election.

Applications, with testimonials (copies only), should reach the undersigned not later than Saturday, March 5th, 1938.

C. C. CARUS-WILSON,
Acting Clerk to the Governors.

ST. BARTHOLOMEW'S HOSPITAL.

APPOINTMENT OF DENTAL HOUSE SURGEON.

Applications are invited for the office of House Surgeon to the Dental Department. Candidates must hold a registrable Dental qualification, and a Medical qualification in addition is desirable but not essential.

Appointment will be required to call upon the three Dental Surgeons and the three Assistant Dental Surgeons. Appointment will be made for six or twelve months as from May 1st, 1938. The salary attaching to the office is £50 per annum (non-resident).

Twelve copies of applications, with testimonials, should be left with the undersigned not later than Monday, February 25th.

February 8th, 1938. C. C. CARUS-WILSON.

THE QUEEN'S HOSPITAL FOR CHILDREN, Hackney Road, London, E.2.

HOUSE PHYSICIAN required April 1st, 1938. EAR, NOSE AND THROAT HOUSE SURGEON required April 1st, 1938.

Six months' appointments. Salary at the rate of £100 per year, with board, lodgings, and laundry in each case.

Applications must be made on forms to be obtained from the undersigned, and must be sent in, with copies of not more than four testimonials, on or before March 7th, 1938.

CHARLES H. BESSSEL,
February 10th, 1938. Secretary.

THE QUEEN'S HOSPITAL FOR CHILDREN, Hackney Road, E.2.

CLINICAL ASSISTANT to Medical Out-Patients required. Attendance on Saturday at 9.30 a.m. for about 2½ hours. An honorarium of 25s. per attendance will be paid. The appointment will be for six months in the first instance and cannot be held for longer than two years. Applications, with copies of not more than three testimonials should be addressed to the undersigned.

CHARLES H. BESSSEL,
February 3rd, 1938. Secretary.

COVENTRY AND WARWICKSHIRE HOSPITAL, COVENTRY.

Applications are invited for the appointment of two HONORARY ANAESTHETISTS.

Candidates must be duly qualified practitioners. The appointments will be made for one year subject to reappointment annually.

Candidates shall be resident in the City of Coventry, or within six miles radius thereof, or shall take up their residence within that radius within six months from the date of appointment.

Canvassing, either directly or indirectly, will be deemed a disqualification.

Applications, with original testimonials and registration certificates, must reach the undersigned on or before February 25th, 1938.

Candidates will in due course receive notice of their eligibility or otherwise from the House Governor, and after receipt of such notice eligible candidates are at liberty to send through the post printed copies of their application and testimonials to the Members of the Board of Management of the Hospital, a list of whose names and addresses will be furnished by the House Governor. No such applications or copies of testimonials shall be sent until receipt of such notification from the House Governor.

By Order of the Committee,
S. CECIL HILL,
House Governor and Secretary.

February 10th, 1938.

Practices and Partnerships for Disposal (continued).

24 S.W. OF ENGLAND.—FOURTH PARTNER required in mixed country town Practice of nearly £6,800 p.a. Panel 4,600. Share worth about £1,100 p.a. at two years' purchase. Partner must be young and have made special study of medicine. Preliminary Assistantship.

25 S.E. COAST.—PARTNERSHIP in non-dispensing Practice, about £4,500 p.a. Panel 1,400. Suitable house would be available. One-fifth share at first at two years' purchase. Preliminary Assistantship. Scotsman preferred.

26 LONDON, W.2, and W.6.—Non-dispensing and non-panel PRACTICES run by two men in partnership. Receipts about £1,150 each practice. Premium two years' purchase and £1,000 respectively.

27 LONDON, N.W.—Steadily increasing PRACTICE in growing residential district within 14 miles of London. Receipts last year just over £700. Panel 60/70. Very attractive detached house (4 bedrooms), with good garden and garage, for sale or rent at £120 p.a. Branch close by to rent. Premium £1,250, or near offer.

28 LONDON, E.C.—City PRACTICE doing about £300 p.a. No visiting, panel or midwifery. Premises to rent at £135 p.a. Premium £500.

29 SURREY.—PARTNERSHIP in old-established PRACTICE, averaging over £2,800 p.a., in outlying suburban district on the Thames. Small panel. Visits 5/- upwards. Outgoing partner's house (5 bedrooms, etc.), could be purchased if desired. One-third share at two years' purchase.

30 MIDLANDS, Cathedral City.—Old-established non-dispensing PRACTICE, averaging £1,550 p.a. Small panel. Visits 6/- to 10/6. Convenient house (about 6 bedrooms), in best residential part to rent at £65 p.a. Excellent prospects for one experienced in clinical pathology. Premium one and a-half years' purchase.

31 DEATH VACANCY.—CUMBERLAND.—Old-established good-class non-dispensing PRACTICE, over £700 p.a., in rapidly growing town. No panel. Large house for sale or rent. Good scope.

32 S. OF ENGLAND.—SURGICAL PARTNER required in good-class Practice in first-rate residential district. Applicant should be aged 30/35 or thereabouts, must hold the English Fellowship and be prepared to do some general practice. Modern up-to-date hospital. Share about £1,000 p.a. at first at two years' purchase.

33 BRITISH WEST INDIES.—SURGICAL PRACTICE in favourite town. Cash receipts, 1937, £1,900. Fine opportunity for experienced surgeon. Well-equipped nursing homes, X-ray and laboratory facilities. Rent of consulting rooms £5 monthly, and house £12 monthly. All kinds of sport. Premium £800.

34 S.E. COAST.—Old-established middle and working-class PRACTICE, about £950 p.a., in favourite summer resort. Clubs worth about £130 and panel about 1,490. Detached corner house (5 bed and dressing-rooms), with large garage and about half-acre of garden, for sale. Scope. Premium one and three-quarter years' purchase.

35 LONDON, N.W.—Old-established PRACTICE doing over £1,100 in residential district under ten miles from

Marble Arch. Select panel 303. House (5 bedrooms), with large garden and garage. Price freehold, £2,750, or rent £150 p.a. Scope. Premium £2,000.

36 NEW ZEALAND.—Eye, Ear, Nose and Throat PRACTICE in a most important commercial city. Cash receipts last year, £2,277. Expenses light. Premium £2,460 cash or £2,400 terms (English currency). Purchaser should be at least 30 years of age with experience.

37 YORKS (N. RIDING).—Well-established country PRACTICE near small market town. Receipts, 1937, about £1,000. Panel 480 (approx.). Appointments £60. Fees 2/6 to 1/1s. Good house with 5 bedrooms, 3 reception rooms, etc., good garden and field, £65 p.a. Premium two years' purchase.

38 S.W. OF ENGLAND.—Country PRACTICE, averaging £2,500 p.a., easy distance of coast (appointments and panel return about £650 p.a.). Large house (3 reception, 6 bedrooms, etc.), in grounds of four acres, including orchard. Price £3,200. Hunting, golf, etc. Premium one and three-quarter years' purchase.

39 EASTERN COUNTIES.—Country PRACTICE, averaging £1,750 p.a., within easy distance of county town. Panel 1,070. Good house (in 2½ acres) with 7 bedrooms, etc., garage, company's water and main drainage. Price £2,000 freehold. Premium two years' purchase.

40 S. COAST.—PARTNERSHIP in mixed Practice, averaging £2,800 p.a., in seaside resort. Panel about 2,000. Semi-detached house (5 bedrooms, etc.), with good garden, for sale or rent. Excellent hospital. Scope for major surgery. Premium one half-share two years' purchase.

41 W. OF ENGLAND Inland Watering Place.—Old-established good-class easily worked PRACTICE. Receipts past year, £722. No panel. Practically non-dispensing. House with 6 bedrooms, etc., large garage and small garden, to rent on lease. Premium £1,000.

42 LONDON, E.1.—Old-established PRACTICE of about £800 p.a., including appointments about £150 p.a. and panel 1,300. Large house (6 bedrooms, etc.), to rent or purchase. Very good scope for increase. Premium £1,600, to include contents of surgery and waiting room, etc.

43 NORTHERN IRELAND.—Middle and working-class PRACTICE in suburb of important seaport. Receipts past year, £963. Panel nearly 1,200. Well-situated house (5 bedrooms), garage, etc., to rent. Practice capable of expansion. Premium £1,400.

44 HOME COUNTY.—PARTNERSHIP in country town Practice, averaging over £4,000 p.a. (increasing), within 25 miles of London. Good appointments and panel about 2,000. Suitable house obtainable. Incoming partner should not be over 30 and must have had one year's P.G. work. One-fourth share at first at two years' purchase.

45 MIDLANDS.—Unopposed country PRACTICE in very pleasant hunting district. Cash receipts last year, £1,097, including good appointments and panel about 500. Well-built house (5 bedrooms, etc.), with good garden and garage. Main electric light and water supply. Price £1,100 freehold. Golf, etc. Premium £1,600.

Purchasers can raise additional capital for the purchase of approved practices or shares.
Particulars will be forwarded on application.

Various appointments producing £250-£300 p.a. Low expenses. Suitable house with 5 bedrooms, etc., can be purchased or rented. Premium 2 years' purchase.
30. **NORTH LONDON.**—Well-established middle and working-class PRACTICE producing about £600 p.a., but offering considerable scope, especially for Panel, which has only recently been started. Suitable accommodation available on rental. Reasonable offer for quick sale, vendor taking up appointment.
31. **NORTH LONDON SUBURB.**—Recently established PRACTICE in fast developing area. Receipts last year about £720, including Panel of about 200 patients. Architect-built modern house with ample accommodation. Freehold for sale. Premium £550 or near offer.
32. **GLoucestershire.—A ONE-THIRD SHARE** in beautiful country district averaging for past 4 years about £1,300 p.a. Panel over 1,100. Appointments about £80 p.a. Good house in own grounds. Freehold for sale. Premium 2 years' purchase.
33. **LONDON, EAST.**—Exceptionally sound old-established PRACTICE in populous area averaging for past 3 years over £2,240 p.a. Panel of approximately 3,500. Suitable house with excellent professional accommodation can be rented at £120 p.a.
34. **LANCS.—SEASIDE RESIDENTIAL TOWN.**—Easily worked, mostly non-dispensing PRACTICE producing about £1,000 p.a., including Panel of about 325. Low expenses. Suitable house available with consulting and waiting rooms, 2 reception, 3 bedrooms, maid's room, etc. Large garden. Garage. For sale or can be rented. Premium 1½ years' purchase.
35. **LEEDS.—PARTNERSHIP** with succession in 6 or 12 months. A 2/3rds share is offered in an old-established Practice which has been held by the vendor, who is now specialising, for the past 2 years. Receipts for last year amounted to £1,176, including £492 from a Panel of about 1,150 patients. Suitable house available, freehold £900. Premium 1½ years' purchase.
36. **WEST OF ENGLAND.**—Good-class residential town.—A ONE-THIRD SHARE with increase up to one-half is offered in a better middle-class Practice and present averaging £1,200 p.a. Appointments worth about £350. Panel of 300 patients. Freehold for sale. Available in vendor's house for single man. Rent £40 p.a., inclusive of rates.
37. **NORTH WALES.**—Good-class long-established PRACTICE in very attractive residential and seaside resort. Cash receipts for last 16 years over £1,200 every year. Panel 425. Good house with 2 small gardens to rent or purchase freehold. Socially very pleasant. Premium £1,800.
38. **EAST ANGLIA.**—Within reach of two good towns.—Old-established unopposed country PRACTICE averaging over £1,000 p.a., including Panel producing over £450 p.a. Low expenses. Detached house with 2 sitting and 5 bedrooms, etc. Rent £70 p.a. Premium £1,750.
39. **NORTH CORNWALL.**—Country PRACTICE in picturesque district near coast and within easy reach of two good towns. Stated to produce nearly £1,000 p.a., including Panel of £320.
40. **WITHIN 25 MILES OF LONDON.—PARTNERSHIP**, with surgical scope. A one-fourth share, with increase later, is for disposal in an old-established Practice, producing about £4,500 p.a. Fees 3/6 to 21/-. A suitable house can be secured. Incoming partner must have a Fellowship, be experienced and on 1½ years' purchase.
41. **WEST COAST.**—Including Panel of 1½ years' purchase.
42. **SURGICAL PARTNERSHIP** in delightful district within easy reach of London. A fifth partner is required in an old-established Practice. There is little visiting done under 10/6, although the patients come from all classes. Incoming partner, who must hold the Fellowship, would do all the surgery for the firm, but must be prepared to do general practice as well. Choice of houses.

4 bedrooms, etc., and all modern conveniences. Garden of about 1 acre. Premium for share and house, £2,500.

The Agency has made arrangements for special facilities, on very favourable terms, to be afforded to approved purchasers for the advance of part of the premium for any suitable practice or partnership. Full details on application.

*In this
terrible February
weather - weaker
people need something
like Numol to bolster
them against illness*

There are those who, at this time, are neither ill nor convalescent, but who, from imperfect nourishment, are nevertheless ill-prepared for the rigours of February—the month when English weather is at its worst.

With luck they will escape the common seasonal infections. With luck—or with Numol.

Numol is simply a concentrated preparation of certain essential food elements often lacking in ordinary diets. It contains the well-known reconstructive properties of pro-

teins, lecithin, hypophosphites and malted carbo-hydrates.

By helping to restore the balance between what diet should be, and what, of necessity, it must be, Numol builds up enfeebled systems and gives reserves of health to the strong.

Prescribe Numol particularly to those whose natural forces are not strong. Numol will give those natural forces the reinforcement they need.

★ Interested doctors are invited to write for a free sample of Numol.

NUMOL

IS ESPECIALLY VALUABLE IN CASES OF POST-INFLUENZAL DEBILITY

"Vitamin B₁ deficiency an outstanding fault in the diet of many millions of people"

(British Medical Journal, 16 Oct., 1937, p. 753)

The reduction in Vitamin B₁ intake, due to changes in dietary habits during the last hundred years, normally amounts to at least 50 per cent., and may be as much as 70 per cent. It has been demonstrated, both experimentally and clinically, that a shortage of Vitamin B acts as a limiting factor in the maintenance of health and nutrition, and often

results in gastro-intestinal disorders, loss of appetite, indigestion, constipation and, if long continued, contributes to neuritis and arthritis.

The logical way to rectify such shortage is to restore to the diet the Vitamin B-containing substance whose removal is responsible for the deficiency.

This substance is available in the form of Bemax.

1. For years it has been the policy of the proprietors of Bemax to ensure its Vitamin B₁ activity by biological assay of *every day's output*. So far as is known, Bemax is the only food product for which such a claim is or can be made.

2. The quantity of Vitamin B₁ supplied by the normal daily dose of Bemax—one tablespoonful—is 200 International Units, an amount sufficient to raise a deficient diet to an optimal level.

3. The normal daily dose of Bemax supplies, in addition to Vitamin B₁, significant quantities of Vitamins B₂ and B₆, copper, iron and phosphorus as well as rich quantities of Vitamin E and other essential dietary elements.

4. Bemax is an entirely natural product consisting only of stabilised wheat germs selected for their Vitamin B₁ activity with no addition whatsoever.

BEMAX

A unique natural source of accessory nutritional factors.

Clinical sample and literature on request.

RHEUMATISM AND PISTANY MUD

X-ray examination of a case where the hip joint was affected
indicates the involution of cartilaginous nodules by Pistany Mud
treatment. The following is the brief report obtained from a
clinic administering the treatment.

Patient had been
suffering from
severe pains in his
right hip since a
fall in 1931.
During the next
three years every
treatment was
tried without
success. The
patient could only
stoop slightly and
very unsteadily.
Lying on his back,
he could lift his
leg only with
great difficulty;
passive lifting of
the leg to a right
angle gave great
pain; rotation in
the joint was
almost impossible.

X-ray showed the
joint densely covered by cartilaginous nodules, varying in size
from that of a grain of pepper to that of a bean.

After 8 Pistany Mud packs the patient was able to dispense with
his splint apparatus, after 16 packs the dragging pains ceased,
the patient walking normally without sticks, and when lying on
his back could raise his stretched leg until at right angles to
his hip without effort. X-ray shows conspicuous change. The
assembly of spots at the upper quadrant of condyle is less
numerous and less intense; some particles have become smaller.
Literature and particulars of a clean, simple method of treat-
ment in clinics, hospitals and homes from The Pistany Agency,
312, Regent Street, London, W.1. Phone: Langham 4214.

Respiratory Emergencies!

SURFACE AND RADIOLOGICAL ANATOMY

By A. B. Appleton, M.A., M.D.,
Professor of Anatomy in the University
of London; W. J. Hamilton,
M.D., F.R.S.E., Professor of Anatomy
in the University of London; and
I. C. C. Tchaperoff, M.D., D.M.R.E.,
Assistant Radiologist, St. Thomas's
Hospital, London.

9 in. by 5½ in., cloth, 388 illustrations,
of which 47 are in colour, 15s. net.

Main features of the book:—

The anatomical basis of physical
examination and of normal radio-
logy is set forth succinctly and
with a wealth of illustration. The
essentials of radiographic inter-
pretation are made clear with the
aid of explanatory diagrams.

Surface contours are shown side
by side with illustrations of under-
lying structures.

Internal structures which can be
examined by special methods such
as rhinoscopy, gastroscopy, and
rectal examination have been
described and figured. The posi-
tions of structures are given as
they occur in the living subject;
the variations are discussed fully.
Attention is directed to the
anatomy of the skin, areas
of referred pain, and lymphatic
drainage, as well as to the fascial
spaces of the hand and the group
action of muscles.

A MANUAL OF RADIOLOGICAL DIAGNOSIS FOR STUDENTS AND GENERAL PRACTITIONERS.

By I. C. C. Tchaperoff, M.D.,
D.M.R.E., Assistant Radiologist,
St. Thomas's Hospital.

Foreword by P. H. Mitchiner,
M.D., M.C., F.R.C.S.

9 in. by 7 in., 286 illustrations, 21s. net.

"This is an excellent book. . .
It will serve as a standard for
many years."—*Clinical Journal*.
"A concise guide to the salient
points in X-ray diagnosis has long
been needed. . . We can heartily
recommend this book."

They call it "the doctor's car"

The Wolseley 14/56 h.p. is particularly suitable for the work a doctor has to do, take for instance:—

EASY STARTING—In the Wolseley 14/56 h.p. a thermostatically-controlled water system does away with warming up delays and sluggish pulling. A 12-volt electric system and twin batteries ensure ample starting energy.

ROOMINESS—Quick and easy exit, through wide doors, fresh air renewal every 60 seconds and anatomically correct seating mean lack of fatigue on even the longest day.

NIGHTWORK—Powerful headlamps, twin fog lamps, stop and reversing lamps and duplex screen wipers lessen the strain of dark and rainy nights.

ECONOMY—24 to 28 miles per gallon is good for a "14," Wolseley stabilised production policy lowers depreciation.

QUIET—Body, door and floor are completely insulated from noise—the interior from fumes.

APPEARANCE—The Wolseley 14/56, either as a Saloon or in its Salon de Ville form, is a distinguished, handsome car—very indicative of the standing of its owner.

The price of the 14/56 h.p. Saloon is from £260—the Salon de Ville £325. 18/80 h.p. are from £280. Super Sixes from £350, and the 12/48 h.p. from £245.

And note that the Wolseley 14/56 develops 56 b.h.p.—well above the average and the highest output of any car paying 10 gns. tax.

DEVELOPMENTAL ABNORMALITIES OF

THE EYE

By IDA C. MANN

284 Illustrations in colour and black and white. Foreword by SIR JOHN PARSONS. 50s. net. Published for the *British Journal of Ophthalmology*.

"We cannot praise too much the pains taken by the author to make the work both complete and authoritative. It is a book which we venture to predict will be constantly quoted and referred to whenever ocular abnormalities are discussed. It will, in fact, readily find for itself a permanent niche in ophthalmological literature."—*The Medical Times.*

The problem of SURGICAL STOCKINGS

Doctors who prescribe Compri-Vena Stockings are sure that the most beneficial support is given as each one is made to the patient's measurements and needs. They have long been recommended for Varicose veins and in conjunction with Injection Treatment as well as during and after Pregnancy. They are also invaluable in relieving undue leg strain. Compri-Vena Stockings are rubberless and yet elastic, are washable, cool in wear and invisible under ordinary silk stockings. They give real relief and preserve the shape of the legs. A skilled staff carefully follow all doctors' instructions. Full details from:

The Hearing Aid Par Excellence! **BÖNOCHORD**

BÖNOCHORD High Fidelity Amplifiers are preferred by all who demand the best obtainable in hearing aids.

Here is a new model which can be worn on the person, while in no way sacrificing the high quality of reproduction for which BÖNOCHORD Amplifiers are recommended by medical men.

Frequency response is from 200 to 8,000 cycles per second. A Piezo-electric microphone and three stages of amplification are employed, also automatic volume-control and noise-suppression. The aid is entirely dry battery operated, with flash lamp cells for low tension which are obtainable everywhere.

All models are available for home trial. Any BÖNOCHORD instrument will besent for clinical test free of charge, on request. Send for the BÖNOCHORD booklet, *The Hearing Aid Par Excellence*, giving full details, illustrations, and prices of all models.

GAS-AIR ANALGESIA

The demand for a simple portable apparatus for the administration of N_2O and air mixture, has led to the production, by this company, of the "Queen Charlotte's" Gas-Air Analgesia Apparatus. Features of this apparatus are perfect safety, low cost, portability, compactness and simplicity. Models of this apparatus have been in successful use, day and night, at Queen Charlotte's Hospital during the past year. Practitioners are invited to apply for an illustrated booklet, describing the apparatus, and giving full particulars and prices.

PERFECT HEARING *after 25 years' Deafness*

The accumulating evidence of the remarkable efficiency of Maxade Hearing Aids in overcoming the handicap of deafness is impressing practitioners and aurists. Here is a typical example of praise for Maxade:

"It enables me to join in the general conversation at home, which I have not been able to do for twenty-five years," writes, Mr. P. B., Upper Sydenham, S.E.26, "and I attended a lecture and heard every word. Without the Aid I should not have heard a sound. It far surpasses anything I have ever tried or known any deaf person to have, and I shall certainly recommend it."

FOCUSED TONE

Maxade is the **ONLY** hearing aid with simple, sensitive controls that enable doctors or patients to adjust pitch and volume to suit perfectly the individual degree of deafness and the particular sounds they wish to hear—even without auditory tests. Moreover, unpleasant, extraneous noises can be "tuned out." Combined with bone or air conduction, Focused Tone achieves the nearest approach to natural hearing that can be secured. Any Maxade model will gladly be supplied for free clinical test.

MAXADE

ENTERED UPON THE APPROVED LIST OF THE NATIONAL INSTITUTE FOR THE DEAF AND CONSISTENTLY RECOMMENDED BY THE PRINCIPAL HOSPITALS.

Hearing Aids

After Influenza Pneumonia and other Acute Infections

The general action of 'Bynin' Amara is manifested by increased tone of the nervous, muscular and cardiovascular systems. It stimulates the digestive organs, improves the flagging appetite, corrects anæmia and aids nutrition generally.

The marked asthenia and nervous depression which are prominent features of the post-influenzal state, yield rapidly to its influence. A course whenever there is any indication of lowered resistance is a valuable safeguard against infection.

In bottles at 2/-, 3/6, 6/6 and 12/-

Descriptive literature and clinical trial sample on application.

OVALTINE

BEFORE AND AFTER OPERATIONS

THE use of "Ovaltine" before a major operation is of great service in helping to build up the system against the strain involved by operative interference. In abdominal cases especially, where a light and unirritating diet is necessary, the use of "Ovaltine" alone for a few days before the operation will be found sufficient to maintain the patient's nutrition at a sufficiently high level.

After severe operations, the regular use of "Ovaltine" is of the greatest service on account of its bland nature, its ready digestibility and its highly nourishing and sustaining properties.

"Ovaltine" is a complete food, composed of fresh, full-cream milk, eggs and malt extract, in the form of crisp granules which dissolve readily in milk to form a delicious beverage acceptable to the convalescent patient.

A liberal supply for clinical trial sent free on request.

the scientific contraceptive

MIL-SAN is a bland, non-injurious, spermicidal jelly independent of variable physiological conditions of moisture or temperature. Since there is nothing to melt, dissolve or foam, MIL-SAN is immediately effective.

The formula of MIL-SAN is based on biological principles in harmony with the natural chemical and bactericidal balance of the vagina. Its spermicidal efficiency is due to: (a) A low pH secured by the reinforcing action of several acids which ensures the immediate immobilization and death of spermatozoa, despite the buffering action of the seminal fluid; (b) A low surface tension which causes the jelly to spread rapidly and to penetrate the rugae of the vaginal and cervical mucous membrane; (c) A degree of viscosity which ensures that it shall adhere to the cervix and upper vaginal tract and fornices, forming a chemical barrier preventing the penetration of spermatozoa into the os uteri.

The method of applying the jelly is simple, hygienic, and proof against carelessness. Each application of 7 c.c. is contained in a specially

made strong glass tube sealed at one end with a cork, at the other by a hard wax plug. In use the cork is removed, a bulb fitted behind the wax plug, and the tube inserted. Compression of the bulb forces the wax plug down the tube and ejects the contents. The empty tube, which is thrown away, proves the application and ensures the quantity. There is nothing to fill, nothing to clean. Each application is hygienic and complete.

MIL-SAN does not deteriorate and is not affected by climatic conditions.

There are no contra-indications to the use of MIL-SAN with a dependable condom or a properly fitted occlusive pessary. It is only by such combined use that the consequences of misuse of one or other of the methods can be minimized and the maximum practicable security obtained. MIL-SAN is on the N.B.C.A. Approved List for use with a cap or condom.

Literature setting out the ingredients and full particulars, together with a box of specimen tubes for examination, are sent on request to members of the medical profession.

CAPROKOL

*In the Treatment of
Urinary Infections*

Following its oral administration 'Caprokol' is absorbed through the walls of the intestines into the blood stream and is carried to the kidneys, being excreted eventually unimpaired in germicidal activity. During its passage through the urinary system 'Caprokol' exerts an analgesic effect (which makes this form of treatment particularly acceptable to the patient) in addition to converting the urine into a bactericidal solution.

'Caprokol' is administered as a matter of routine in the treatment of acute infections of the urinary tract such as cystitis, pyelitis, prostatitis and urethritis.

MAGSORBENT GLUCOSE

(Regd. Trade Mark)

(Magsorbent Brand of Magnesium Trisilicate with Glucose.)

A pleasant carminative combination of pure medicinal Glucose (Dextrose) and Magsorbent, flavoured with the finest oil of Peppermint.

The preparation will be found of particular value in the treatment of Acidosis in children.

Its corrective action in acid conditions is compounded:

1. By neutralisation of the products of acid fermentation in the stomach and intestines.
2. By normalisation of fat metabolism and the prevention of ketosis.
3. By its sustained control of the reaction of the gastric juice.
4. By its powerful adsorption of intestinal toxins and its protection of the liver.

INDICATIONS

Acidosis, Ketosis, cyclical vomiting, Insulin reaction, also train, car, air, and sea sickness.

PRICES: Granules 1/6; Tablets, 50-1/4, 200-4/-.

Samples and literature from the sole manufacturers.

Sample and Literature on request.

Serenol is a sedative with action on the centres of the nervous vegetative system, sympathetic and parasympathetic, and on the cortical centres. Recent knowledge has shown the interaction of nervous vegetative system and endocrine system, and on this knowledge *SERENOL* is based. It is thus a biological; not a symptomatic, sedative, and, unlike many other sedatives, has not a direct depressant action on the cortical cerebral centres.

Serenol is indicated in conditions of anxiety and general irritability, insomnia, hyperthyroidism, hyperadrenalism (as in neurocirculatory asthenia, effort syndrome), the so-called nervous palpitations of the heart, etc.

Serenol is given in the following dosage. *For mild cases one to two dessertspoonful on retiring. For more severe cases one dessertspoonful at 10 a.m., one dessertspoonful at 4 p.m. and two dessertspoonful on retiring.

Serenol, being a biological sedative containing no barbiturate, is not habit forming.

CONTINENTAL LABORATORIES LTD.

30 MARSHAM STREET, LONDON, S.W.1

Reduced Mortality

In reviewing 19 cases of agranulocytosis seen at one New York City hospital during recent years, two observers comment on the reduction in mortality from 62% to 27% since the introduction of 'Pentnucleotide' (N.Y. State Jour. Med., 37:38, 1937). While giving due credit to the use of liver preparations and to transfusion, especially when the latter is given concurrently with 'Pentnucleotide,' the authors conclude: "'Pentnucleotide' appears to be the most effective form of treatment."

A mixture of the sodium salts of pentose nucleotides for intramuscular use in the treatment of

AGRANULOCYTOSIS

Further information on 'Pentnucleotide' will be sent to any interested physician on request.

VERONIGEN

A LIQUID PREPARATION OF THE HYPNOTIC BARBITONE OR DIETHYL-BARBITURIC ACID

When given in reasonable doses it is claimed that it does not produce any toxic symptoms whatever, nor is cumulative in action, and in ordinary cases of insomnia one fluid drachm of VERONIGEN is sufficient dose for an adult. As a preventive of post-operative vomiting, one to two fluid drachms of VERONIGEN may be given one-and-a-half to two hours before general anaesthesia is produced; and as a result much less of the anaesthetic is required. As BARBITONE has a slight diuretic action, the mixture can be used more safely than other hypnotics when the heart is weak. Where sleeplessness is a concomitant of pain, rest and relief can frequently be obtained by the administration of one drachm of VERONIGEN and two drachms of ELIXIR ACID ACETO-SALICYLIC (Hewlett's).

DOSE FOR ADULTS.—One fluid drachm diluted, one hour before going to bed.
For Nervous Sleeplessness in Children.—10 to 20 minims diluted.

Introduced and Prepared only by

C. J. HEWLETT & SON, Ltd.,

*is the only Palatable Liver Oil
with vitamin content standardised
in accordance with B.P. dosage*

Cod Liver Oil well deserves its high reputation as a health-builder. For it contains nature's vital Vitamins A and D in their right proportion. It is the liver oil specifically named by the Ministry of Health and League of Nations Nutrition Committee. Its only drawback in the past has been its taste. But now we have overcome that. In "SevenSeaS" we have produced for the first time a pleasant palatable Cod Liver Oil, and it may be obtained in "High Potency" form too.

"SevenSeaS" is obtainable in three forms: (1) Standard B.P. Oil; (2) High Potency Oil—four times B.P. standard; (3) High Potency capsules containing 5 mm. dose of High Potency Oil. We would like all practitioners to prove to their own satisfaction just how revolutionary "SevenSeaS" High Potency Cod Liver Oil is. Please send to the address below for a free sample.

 5-lbs. (Hospital size) 40/-
 and in tablets: tins of 48, 2/3

Disease-emaciation

"EVERY medical practitioner knows how difficult it is to nourish a patient suffering from disease-emaciation. . . . Do we not all recognise the fact that the starving tissues are fed, not by the food swallowed by the patient, but by the amount of nutrient matter absorbed by the gastric and intestinal mucous membrane? If we could ensure the absorption of nutriment into the blood, the problem of nutrition in disease would be reduced to a matter of mere chemistry and mechanical feeding. . . . Judging from clinical results, 'Sanatogen' appears in many cases to possess some power of ready absorbability, without which the richest foodstuff represents simply so much foreign matter in the stomach and intestines. . . . My own experience of 'Sanatogen'. . . is that it stays the diarrhoea—ten or twelve motions a day are thereby reduced to one or two; it stops vomiting, and it improves general conditions and causes the patient to put on flesh."

"NUTRITION IN WASTING DISEASES OF CHILDREN AND ADULTS"

(*Medical Press and Circular*)

"THIS condition, which results from imperfect digestive or absorptive power, or which may follow stomatitis, pyloric stenosis, deformity of the tongue or palate, tuberculosis or syphilis, is most frequently associated with improper feeding. Fats in such cases are not well tolerated, but the contrary is true with respect to proteids. . . . The use of 'Sanatogen', in these cases, proved so satisfactory that we have been encouraged to try it in other cases of infantile atrophy, and have had almost equally pleasing results in a number of patients suffering from this condition. It is quite apparent that 'Sanatogen' has considerable power in influencing nutrition. . . ."

"INFANTILE ATROPHY"

(*Practitioner*)

"I HAVE before me the records of forty cases fed with 'Sanatogen'. They show, what was obvious to myself and the nurses when watching the cases, that these patients wasted less during the acute stage, and picked up more rapidly during the convalescent stage, than patients who did not have 'Sanatogen'. This fact, indeed, was soon recognised by the ward sister, without my having in any way drawn her attention to it. . . . I am firmly convinced that it is a most valuable food for the typhoid patient."

"THE TREATMENT OF TYPHOID FEVER"

(*Medical Times*)

SANATOGEN

Relieves Congestion — Combats Infection

Metaphedrin Inhalant No. 99 offers, in a light, bland mineral oil solution, the shrinking and decongesting effects of Ephedrine alkaloid 0.95%, and the powerful antiseptic properties of Metaphen 1:2,500. Sprayed or dropped into the nose, this Abbott Inhalant not only relieves pain and congestion caused by "head colds," hypertrophic rhinitis, hay fever and nasal or sinus infections; but also provides a potent agent to combat infection. Metaphedrin Inhalant No. 99 is also of great value as a preventive of infection and, when used at the very onset of certain cases, often shortens the

course of the disease itself. ● An important advantage of Metaphedrin Inhalant No. 99 is its very low surface tension which results in an increased miscibility with the aqueous nasal secretions. A special dye developed in the Abbott research laboratories protects the Ephedrine alkaloid content of the preparation against the decomposing effect of light. ● Metaphedrin Inhalant No. 99 is supplied in ½-ounce, 1-ounce, 4-ounce and 16-ounce bottles; as well as in convenient Atomizer Outfits in which

a ½-ounce bottle of Metaphedrin Inhalant No. 99 is offered in combination with a compact atomizer. ● Requests for professional literature and for free trial samples will be welcomed. The coupon below is for your convenience.

COLLIRON

A highly concentrated preparation
containing
10 per cent of Iron
in the form of
Colloidal Iron Hydroxide
with a trace of Copper

for the effective treatment of
the microcytic anaemias,
debility and fatigue

The dosage of Colliron

Adults—20 minims three times daily after meals, or for intensive treatment, one teaspoonful once or twice daily.

Children—5 to 10 minims three times daily after meals, or for intensive treatment, 15 to 30 minims once or twice daily.

Colliron is issued in bottles:

4 fld. oz., 3/-	16 fld. oz., 9/8
8 fld. oz., 5/4	40 fld. oz., 22/-
80 fld. oz., 40/-	

A PRODUCT OF EVANS BIOLOGICAL INSTITUTE

Evans Sons Lescher & Webb Ltd.
Liverpool and London

At the first suspicion of Pneumonia

TYPE IT!

Lederle

PNEUMONIAS OF DIFFERENT ETIOLOGY are distinct diseases. Early specific treatment—so vital to successful serum therapy—is possible only when the type of pneumococcus is determined immediately.

The Neufeld method, for pneumococcus typing directly from sputum, is simple, accurate, and permits of a diagnosis being made within a few minutes' time.

Rabbit Typing Sera are supplied in 0.5 cc. vials for monovalent Types I to XXXII (except Types XXVI and XXX, which apparently are identical with Types VI and XV, respectively), and for the following combinations—

Mixture "A", containing Types I, II, and VII

Mixture "B", containing Types III, IV, V, VI, and VIII

Mixture "C", containing Types IX, XII, XIV, XV, and XVII

Mixture "D", containing Types X, XI, XIII, XX, XXII, and XXIV

Mixture "E", containing Types XVI, XVIII, XIX, XXI, and XXVIII

Mixture "F", containing Types XXIII, XXV, XXVII, XXIX, XXXI, and XXXII

Send for Booklet—

TRADE MARK 'LEXTRON' BRAND

Liver-Stomach Concentrate with Iron and Vitamin B Complex

IN "SECONDARY" ANAEMIAS

In anaemias of the microcytic type, the response to 'Lextron' brand liver-stomach concentrate with iron and Vitamin B complex is rapid. When he prescribes 'Lextron' the physician is assured that his patient will receive all the materials essential to blood regeneration in anaemias of this class.

'Lextron' brand liver-stomach concentrate with iron and Vitamin B complex is supplied in bottles of 42, 84, and 500 'Pulvules' brand filled capsules.

ACRIFLAVINE PREPARATIONS BOOTS

IN A RECENT ARTICLE ON THE USE AND ABUSE OF ANTISEPTICS (Brit. Med. J., Dec. 18th, 1937, page 1233) SPECIAL ATTENTION IS DIRECTED TO ACRIFLAVINE AND RELATED ACRIDINE COMPOUNDS

"These are the only substances which have been proved by controlled animal experiment to be capable of averting wound sepsis. They kill or prevent the growth of pyogenic cocci in extreme dilution, act slowly, and in some cases are more bactericidal in serum—a unique property. They are also relatively non-toxic, sufficient concentrations for antiseptic action demonstrably leaving the activities of leucocytes unimpaired; this property is also unique. It is therefore possible to infiltrate tissues with solutions in order to prevent infection or to arrest it at an early stage."

Preparations of Acriflavine and Neutral-Acriflavine are available in the form of Emulsion, Cream, Tablets, Solution Tablets, Medicated Gauze, Pessaries, Bougies & Pigment.

Full particulars and literature will be sent on request.

OF PREVENTIVE MEDICINE

Anti-Pneumococcus Serum (Type 1) Concentrated

Anti-Pneumococcus globulin solution is prepared from the serum of horses that have been immunized with virulent cultures of Type 1 pneumococcus. Early administration of the globulin solution in cases of lobar pneumonia (Type 1) is of the greatest importance, because the antibody exerts its maximum effect when it is given within the first three days of the onset of the illness.

DOSAGE.—If possible, the patient should receive an initial dose of at least 20,000 units, followed by 10,000 units every eight hours until definite signs of clinical improvement are observed. The globulin solution should be injected intravenously.

In ampoules of 10,000 units, 15/- each.

In circumstances where the concentrated product cannot be used owing to its cost, a natural serum is advisable. Intramuscular injections are to be preferred when the natural serum is used, and, according to reports from various sources, may be injected to give satisfactory results.

In ampoules of 4,000 units, 4/- each.

DIGOXIN

(B. W. & Co.)

The stable digitalis product of uniform activity and reliability

Wherever Digitalis therapy is indicated DIGOXIN can be employed with the greatest and most satisfactory effect.

Orally or intravenously its action is rapid, a characteristic of particular value in auricular fibrillation.

DIGOXIN is isolated from the leaves of *Digitalis lanata* which is more active therapeutically than *Digitalis purpurea*.

It is stable both in solution and as 'TABLOID' DIGOXIN.

Patent Injection

For Oral Use

'TABLOID' DIGOXIN, 0.25 mgm.

Bottles of 25 products, 1/4 each. Bottles of 100 products, 4/4 each.

SOLUTION OF DIGOXIN (B. W. & Co.)

0.5 mgm. in 1 c.c.

Bottles of 10 c.c. (with Pipette), 2/- each.

Bottle of 30 c.c. (with Pipette), 3/6 each.

Bottles of 250 c.c., 2/- each.

For Injection

'HYPOLOID' DIGOXIN

Each ampoule contains 0.5 mgm. Digoxin in 70 per cent. alcohol.

Boxes of 10 'Hypoloid' ampoules of 1 c.c., at 3/4 per box.

TRAUMA OF THE HEART*

BY

HUGH BARBER, M.D., F.R.C.P.

Physician to the Derbyshire Royal Infirmary and to the Derby City Hospital

Trauma of the heart may result (1) from wounds and direct violence and (2) from strain of effort. Wounds of the heart are not common in this country, and will be excluded from this discussion. Direct violence to the chest wall may rupture the heart muscle, causing death, or may cause death without obvious heart injury; or it may give rise to the following clinical conditions: (1) pericarditis; (2) angina of effort; (3) a disorder of rhythm; (4) lesion of a valve; (5) contusion of the heart muscle. Strain may result in: (a) a disorder of rhythm; (b) lesion of a valve; (c) primary cardiac overstrain.

Spontaneous rupture of the heart muscle is, of course, the result of coronary disease. Goodall and Weir (1927) record eighteen cases, but in only four was there evidence of emotion or strain. Such an event can hardly be included in trauma of the heart.

Genuine cases of heart disease the result of injury or sudden strain are not very common. There is nothing distinctive about the physical signs. For a diagnosis we depend upon an accurate history and, if obtainable, previous personal medical knowledge of the patient. Many doctors can quote one or two cases in which they were convinced that trauma produced disease of the heart, or that it so aggravated the condition of a heart already diseased that the whole life-history was changed. A traumatic heart lesion shown at a clinical meeting will provoke criticism, because the physical signs will be similar to those met with in disease due to natural causes, and it must be demonstrated that the condition before, at the time of, and immediately after the trauma has been correctly assessed. Nevertheless, I believe that at the present time more cases of heart disability the result of trauma are overlooked than are diagnosed by mistake.

During the last thirty years I have made brief notes of twenty cases in which trauma of the heart must be considered seriously. Twelve have been the result of direct violence and eight the result of strain, although in three of them both forms of trauma may have been acting together. One man with a traumatic lesion of the mitral valve was under observation for seventeen years until he died, when the trauma was confirmed at necropsy. In the twelve cases of direct violence it is safe to presume that the heart was normal before the injury. In three of the eight cases due to strain it is presumed that the heart was already diseased, but the strain altered the whole life-history. A reasonable definition of a normal heart would be: one that is efficient for the age and usual activities of an individual, and which would show no

abnormality on examination with all the methods at our disposal.

Recorded cases in medical literature are difficult to collect, although there are examples typical of many well-recognized possibilities. It is reasonable that standard medical textbooks should be very guarded in relation to injuries of the heart. These play a small part in the natural history of disease. Books written as a guide in compensation cases are helpful in classification and make valuable reading, but they aim at a finality of statement that is not always in keeping with such an individual problem as injury. Allbutt (1870) wrote chiefly from the point of view of the part played by overstrain in artisans in producing degeneration. He made a point that he gained wide experience in the industrial area of Leeds. In mentioning certain cases in which a sudden strain appears to have caused structural damage he suggests that these may be extreme instances of an agency always at work, in some degree, in those who do heavy manual labour. He concludes: "But when we come to refine upon labour and endeavour to separate it into two categories of sudden and continuous efforts we find very often that the distinction is almost impossible." There are, however, a number of cases where the distinction can be drawn between sudden and continuous effort; and a number of cases of trauma or alleged trauma of the heart in those not engaged in heavy work—that is to say, the result of an exceptional event in one unsuited to the effort. And disease of the heart may result from the direct violence of a blow on the chest wall.

The study of traumatic heart disease resolves itself into two problems: (1) whether the heart be diseased at all—which is perhaps the more difficult; and (2) whether a cardiac disability is due to trauma or to natural causes. For this latter consideration the physical signs are almost negligible. A detailed and accurate history, in the widest sense, is all-important. The patient must be studied as a witness, and also his relatives. Not less important is a reliable family doctor who knows his artisan patients personally and makes a note when first called in. It is my association with a number of these who attend clinical meetings regularly which encourages me in the attempt to assess some of the evidence about trauma of the heart.

Some Post-mortem Records of Heart Trauma

1. *Without External Bruising or Injury to the Chest Wall.*—Groom (1897) was called to a boy of 16 who had collapsed while walking, and found him dead. A month previously the shaft of a pony trap pressed him against some railings. He lay up for five days. There was no external bruising. Post

* From addresses to the Derbyshire Branch of the British Medical Association on October 27, 1937, and to the Derby Medical Society on November 9, 1937.

G.L. Products of Special Interest in Everyday Practice

EXAMEN PARENTERAL LIVER EXTRACT

Examen Liver Extract marks a triple advance in parenteral liver therapy . . . in higher potency, greater purity and consistent uniformity. Each 2 cc. ampoule of Examen Liver Extract contains the hæmopoietic factor derived from 100 grams of fresh liver, a concentration which permits of small and relatively infrequent dosage. Examen is painless on injection and produces no allergic reactions. Boxes of 3 x 2 cc. G.L. ampoules, 13/4; 6 x 2 cc. ampoules, 25/-.

WHOOPING COUGH DISSOLVED VACCINES G.L.

Of special significance, both in the prophylaxis and treatment of whooping cough, is the advance in vaccine therapy represented by Dissolved Vaccines G.L.—in which the antigens are in solution and detoxicated. Thus (1) when injected, an immediate antibody response can be produced; (2) high doses can be administered without risk of undesirable reaction. In rubber-capped bottles, 5 cc., 10/9; 10 cc., 15/6; 25 cc., 25/-.

PRODUCTS OF THE
GLAXO LABORATORIES

ADEXOLIN CONCENTRATES OF VITAMINS A and D

Adexolin vitamin concentration is of such potency that the smallest prophylactic dose, and the largest dose required for "massive" vitamin therapy, can be given with equal convenience. Each 3 m. Adexolin capsule contains 6,000 international units of vitamin A and 1,000 of D (equivalent in both vitamins to 3 teaspoonfuls of medicinal cod-liver oil). Each cc. of tasteless, inodorous Adexolin Liquid contains 12,000 units of A and 2,000 of D. *Capsules:* 25, 2/6; 100, 7/6; 500, 30/6. *Liquid:* 1 oz., 2/6; 2 oz., 7/6; 4 oz., 12/6; 8 oz., 22/6.

GLUCOSE-D THE PATIENT'S STRENGTH IN ILLNESS

For modern glucose therapy *Glucose-D* supplies (a) medicinal glucose for immediately available energy and nourishment; (b) calcium and phosphorus, i.e., protective minerals essential for healthy tissue function; (c) *Ostelin vitamin D* to make the minerals available to the body. *Glucose-D* thus provides, in addition to energy fuel, important elements needed particularly by those who are compelled to follow a restricted diet, e.g., in febrile conditions and acidosis. In tins: 1/9; three times quantity, 4/6; seven times, 10/6.

Above prices (not in Eire) are subject to usual professional discount.

GLAXO LABORATORIES LTD.

GREENFORD, MIDDLESEX. BYRON 3434

condition. There was evidence of a hypertensive heart, but one cannot entirely ignore the injury as a possible exciting cause of the flutter.

C., aged 58, with good health, had not seen a doctor for ten years. A signboard fell on his head, and he was admitted to the Derbyshire Royal Infirmary with a fracture-dislocation of the cervical vertebrae. The pulse chart records the rate as between 80 and 90 until the tenth day, when it is 120, at which level it persisted. Seen in July, 1935, about three months after the accident, when he had returned home, he was getting about, but was short of breath on exertion. The pulse was regular, the rate being 120 to 130. The blood pressure was 160 mm. systolic and 100 mm. diastolic. The heart was enlarged. An electrocardiogram showed a tracing typical of auricular flutter, with a ventricular rate of 120 and an auricular rate of 240. One may conclude that there was a hypertensive heart before the accident, but that the auricular flutter developed about ten days later.

3. *Extrasystolic Arrhythmia*.—Kahn and Kahn (1928) record a case of extrasystolic arrhythmia the result of direct injury of the chest wall. But such irregularity is not a definite entity and is no disability in itself. One may only conclude that there is an irritable focus in the heart muscle. The case in question may have been a contusion of the heart, or it may be that the rhythm was disturbed from a neurosis. As an example of such arrhythmia following injury I have the following notes.

J. H., aged 46, was gored by a bull. He was unconscious for twenty-four hours and was detained in hospital three weeks. There was a large scalp wound. Three lower ribs were fractured on each side. It was noted that the pulse was irregular. Four months later the exercise tolerance was poor and the heart showed numerous ventricular extrasystoles. The irregularity persisted a year after the accident. Physical examination and an electrocardiogram showed no other changes. He was capable of taking a fair amount of exercise without discomfort, but had not regained his full capacity. This case is complicated by the fact that he had a primary syphilitic lesion during the war and the Wassermann reaction is still positive.

A heart which is irregular on account of extrasystoles may be the only abnormal finding after some sudden strain. It is an important problem. The prognosis and treatment depend upon the underlying cause of the premature beats. Some cases are probably due to a strained heart and others to a neurosis. We may discuss the question under the heading of "primary cardiac overstrain," although it is understood that not all cases of strain or alleged strain exhibit extrasystoles.

VALVULAR LESIONS

Rupture of a valve from strain or direct violence illustrates the importance of a correct history, because it is upon this that the diagnosis is based clinically; and even after death the history is required to make the diagnosis certain. There will be immediate and urgent distress, with pain which is obvious in lesions due to effort, and, unless masked by external injuries, equally obvious in direct violence.

Rupture of an aortic valve from strain was described by Peacock (1865a). It is an accident that is not very uncommon. The valve is almost certainly diseased before the effort, although functioning reasonably well. For an insurance company I obtained the following history from the late Dr. Bruce of Melbourne, Derbyshire:

A farmer, aged 56, pushed a cart out of a ditch. There was immediate substernal pain with distress and palpitation. He managed to walk very slowly to the doctor, and said he could hear a noise in his chest since the effort. There was a loud to-and-fro aortic bruit. He died of congestive failure a few weeks later.

Traumatic lesions of the mitral valve are rare. Allbutt (1870 and 1873) recorded three cases of rupture of a mitral valve from strain. Gordon (1922) described a case of lesion of the mitral valve from strain while running.

It was in a young woman of 24, who afterwards could hear a noise in her chest on exertion. He considered that the lesion was slight. He also describes a man in whom the aortic valves were ruptured from a blow, and who died soon afterwards.

Peacock (1865b) described the case of a girl of 19 with valvular heart disease in which the symptoms were not serious.

She had a severe attack of vomiting, followed by immediate distress and death in a few hours. At necropsy there was chronic rheumatic endocarditis of the mitral valve; the chordae tendineae were ruptured, so that one cusp of the valve was entirely loose. Horton-Smith (1902) described rupture of chordae tendineae in a workman aged 33, due to a strain. There was immediate pain with shortness of breath, followed by passive congestion. He died in three months: at the post-mortem examination the valves showed no evidence of previous disease.

I have recorded (with Osborn, 1937) full details of a case of mitral stenosis the result of trauma.

A man 32 years of age joined up at the beginning of the war in 1914 with a previous history of good health and athletic activity. He served a year in the front line. In 1915 he was blown up and buried in the debris. A day or two later he recovered consciousness to find his heart very distressed. There was no external injury. He was five years in one hospital and another. From 1919 till his death from pneumonia in 1937 he was under my own observation. It was obvious in 1919 that the mitral valve was diseased, there being a systolic bruit and a localized mid-diastolic sound. Five years after the injury he could sit out of bed, and gradually he improved. By 1930 (fifteen years after the injury) the signs were indistinguishable from those of mitral stenosis of rheumatic origin. There was a presystolic thrill and localized presystolic bruit. His condition remained stationary. When he died from pneumonia twenty-two years after the injury the stenosis was very obvious and there were features which confirmed beyond doubt the diagnosis of trauma.

The evidence is conclusive that the mitral valve was normal before the trauma. The same applies to Wilks's case of ruptured aortic valve from a fall. It is this feature which makes direct trauma of a valve particularly interesting, because a blow might produce a less serious lesion, whereby a slight tear or contusion of a valve would progress towards chronic valvular disease when healing. Allbutt (1873) described two cases of mitral stenosis in young men—in one case due to the kick of a horse and in the other to a blow with a cricket ball. The immediate distress at the time of the injury was alarming, but the heart's function was not distressed soon afterwards to a degree that would indicate rupture of a valve. Allbutt saw each patient about a year after the blow and found definite evidence of mitral stenosis, which he attributed to trauma. These cases were recorded a long time ago, but the diagnosis can only be based on observation and assessment of the history and clinical evidence. No modern facilities would help to prove or disprove the diagnosis of a traumatic valvular lesion.

Clinical Conditions which may Result from Direct Violence but not from Strain

1. *Pericarditis*.—Traumatic pericarditis is a well-recognized possibility as the result of a blow on the chest wall. In itself it is not serious; and it may not have been searched for sufficiently often in the surgical wards. A

mortem the left ventricle was seen to be ruptured posteriorly. It appeared to have developed from the endocardium outwards, with eventual haemorrhage into the pericardium. O'Neill (1914) described the case of a boy aged 9 who was "knocked down and jumped on." There were certain bodily injuries, so that he was kept quiet but not absolutely at rest. The heart was not specially examined. He died forty-seven days later, and a perforating slit was found at the auriculo-ventricular junction on the left side, with haemorrhage into the pericardium. Hamilton (1934) recorded the case of a child of 7 years brought in dead to hospital. The front wheel of a car had passed over the chest wall without causing external bruising or damage to the bones. Both ventricles were ruptured. Fraser (1929, quoting Vaguez-Laidlaw) describes a man who was struck by a carriage pole. He was admitted to hospital with dyspnoea and palpitation. There was an unusual sound at the base of the heart. The symptoms soon cleared up and he was discharged. He was readmitted several months later with congestive heart failure, from which he died. Post-mortem examination showed laceration of the heart muscle in the region of the conus arteriosus. Wilks (1865) recorded the case of a young man who fell from a height, striking his left side on a stone. He died two days later from peritonitis due to a ruptured bowel. Dyspnoea had been present, but a stethoscope was not used. No external bruising was seen at necropsy. The posterior cusp of the aortic valves was split transversely, but there was no sign of chronic disease of the valves. A small deposit of fibrin was found on the ragged edges of the valve. Gibson (1909) recorded a case, in the Edinburgh Royal Infirmary, of rupture of the mitral valve from the kick of a horse.

2. *Experimental*.—Kahn and Kahn (1928) state that it has proved possible in the dead subject to rupture a valve by striking the chest, without injuring the bones of the thorax. Allbutt (1909) gives the names of several distinguished pathologists who have succeeded in this.

3. *With a Fractured Sternum*.—At a coroner's post-mortem recently at the Derby City Hospital I was present when Dr. Osborn demonstrated disease of the aortic valves very suggestive of being the result of trauma. There was an old fracture of the sternum over the base of the heart. The man was wounded during the great war, when a front-line soldier, so that presumably his heart was normal. Whilst he was in a casualty clearing station the sternum was fractured by a fall of roof during an air raid, after which he was invalided out of the service. The history is so fragmentary that it is not possible to make a definite diagnosis of traumatic disease of the aortic valves, but it is the most probable explanation. The aorta itself was particularly healthy, as also was the mitral valve.

Clinical Conditions which may Result from either Direct Violence or Strain, or from Both Together

DISORDERS OF RHYTHM

1. *Auricular Fibrillation*.—Of this condition Price (1937) states: "Its onset can now and then be traced to bodily effort, especially in the middle-aged or elderly, perhaps to trauma." This is what we should expect from the natural history of the condition. The event is more probable if the disposing causes of age or mitral stenosis exist. White (1937) states that it may result from direct trauma, excitement, or exertion. In some accidents all these causes will be present, as in two of my cases recorded below. It is surprising to find the statement in a book on incapacity or disablement (Brockbank, 1926): "I have never met with a case in which auricular fibrillation could be attributed to sudden strain, and at present I should be very unwilling to believe that strain could cause it." Hay and Jones (1927) recorded five cases of auricular fibrillation, of which four were due to sudden physical exertion and one to electric shock. They state that four of the patients were apparently well before the exciting cause or accident. They claim that sudden strain frequently initiates auricular fibrillation in diseased hearts, and in addition that fibril-

lation may result from physical strain in hearts that are apparently normal, so far as can be determined by ordinary clinical methods. As a typical example of the result of strain on a diseased heart I have the following notes (1934).

W. H. P., aged 46, gave a history of rheumatic fever twenty years ago. He was refused for war service, but led an active life, in good health, working on an estate. His doctor knew that he had mitral stenosis. One day, while carrying a tree-trunk, his mate failed and W. H. P. had to bear the whole weight. Pain and discomfort developed in the chest, and he had difficulty in getting home on account of shortness of breath. He passed one or two restless nights, after which his doctor diagnosed auricular fibrillation. Seen four months later, the fibrillation was confirmed by electrocardiogram. The mitral stenosis was obvious. There was no congestive failure. The exercise tolerance was poor. A course of quinidine in hospital produced toxic symptoms, but failed to restore normal rhythm. The arrhythmia has persisted since.

Kahn and Kahn (1928) record cases of auricular fibrillation following direct trauma of the chest wall. I have seen two such cases; after a man had been knocked down by a motor car. There has been no evident bruise on the chest wall or actual history of a blow over the heart, so that both direct trauma and sudden strain may have acted together. Both were elderly, and possibly liable to the disability, but in good health for their years.

T. C., aged 61, acting as a night watchman, was knocked down by a car on January 21, 1932. He was taken to the casualty department at the Derbyshire Royal Infirmary; about this he remembers little. After being detained for a few hours he was sent home by car to rest in bed. He noticed he was short of breath, and his doctor recognized an irregular pulse. The shortness of breath persisted, and although his external injuries were trivial it was obvious that his capacity for exertion was entirely changed. Seen by me in December, 1932, the fibrillation was confirmed by electrocardiogram. There were no other abnormal signs, or other abnormalities in the tracing. There was no congestive failure. Five years later his condition was unchanged.

Mr. W., aged 63, was knocked down by a car on December 22, 1936. He was taken to the Derbyshire Royal Infirmary, where an irregular pulse was noted. He was kept in a surgical ward for fourteen days' rest on account of a scalp wound. On returning home he was dizzy and easily became short of breath. His doctor noted the irregular heart. Seen on February 3, 1937, he was of excellent physique for a man of his years, with the history of an active life. Physical examination revealed nothing abnormal except the arrhythmia, which was confirmed as auricular fibrillation by electrocardiogram. I understood he was making no claim, because he considered himself entirely to blame for the accident. But there was no question that a heart previously efficient for his life was now causing incapacity.

Both these cases illustrate the need for more accurate notes after an accident. This history of scalp wound is of interest because Bramwell (1934) has recorded the case of a coal-miner in whom auricular fibrillation was present after a blow on the head. He is rather guarded about attributing the fibrillation to the trauma, although the evidence strongly suggests it.

2. *Auricular Flutter*.—The disposing causes of this condition are similar to those producing fibrillation, but I have seen no reference to trauma as an exciting cause.

One case of auricular flutter came under my own observation in 1935 after a fracture-dislocation of the cervical vertebrae. From the hospital records it would seem that flutter developed several days after the accident whilst in bed. It is difficult to find a reasonable explanation, but the fact remains that when the patient had recovered from his surgical injuries he was totally incapacitated by reason of the heart

function." The condition has been more like the senile heart than any other condition due to natural causes. The following typical example may be cited:

H. B., aged 50, a collier. Five years ago a steel bar crushed his chest against the roof of a coal-mine, causing fracture of five ribs on the left side. He was three weeks in the Chesterfield Hospital and three months an out-patient. He returned to work, but gave up after three days because he was short of breath on exertion and dizzy, especially after stooping. He has worked for short periods since, but has always required extra help from his mates. He has remained short of breath on exertion, with some aching in the left side. His general condition and muscular tone were good. He was a steady and reliable man of the best type. The chest expansion was 2½ inches. X-ray examination showed a heart of normal size, with the lungs clear and the ribs united. The arteries were healthy. The blood pressure was: systolic 115 mm., diastolic 75 mm. The heart showed no abnormal signs, and an electrocardiogram was normal. The pulse rate was 96 on arrival; it was 84 after a short rest; after slowly climbing eighteen stairs it was 140, and he was short of breath. While walking slowly he was incapable of talking without exhibiting shortness of breath.

Primary Cardiac Overstrain

In studying this difficult problem the type of strain causing the disability, or alleged to cause it, may be of three possible varieties, which must overlap to some extent, but of which the typical examples are quite distinct. These are: (1) the strain of athletic event, (2) the effort syndrome, and (3) the intense unexpected effort for which a man is not trained and during which the chest is probably fixed, with the glottis closed.

1. Strain in athletic event is almost confined to those taking part when suffering from some infection. Occasionally the untrained man may disturb his heart with a rowing or climbing effort.

2. The effort syndrome, strictly speaking, has little relation to strain, except in the differential diagnosis from overstrain. In its most characteristic form it first shows itself during some effort which a man has carried out before. During the war the first impression may have been that the symptoms developed as the result of physical over-exertion and mental emotion, acting on those unsuitable for the strain. Probably to some extent this was the explanation. In civilian life it occurs in women as well as in men. The modern view is that effort does not cause the condition, but calls attention to it. At the same time it is admitted that it sometimes develops after a severe effort, and also that in spite of the best of treatment some of the subjects must be warned that they are unsuited for strenuous callings.

3. The intense unexpected effort usually comes about, with the chest fixed and the glottis closed, during a lifting effort which is unexpectedly strenuous or prolonged. Perhaps the effort cannot be relaxed without some disaster occurring. Anxiety on this account may directly affect the heart capacity at the time. It is this type of effort that is most likely to damage the heart. The following brief notes will illustrate a clinical example.

J. B., aged 30, was carrying a bag of cement weighing two hundredweight across a stream. His foot slipped, and he made a very considerable effort to save the bag from falling into the stream, which would have ruined the cement. He had acute distress in the left side of his chest and collapsed on the ground. This was in the middle of the morning. He went on doing light work all day, suffering from palpitation and shortness of breath. He walked home a mile or two very slowly with his father, for whom he worked. He went to bed and passed a restless night. His doctor kept him in bed three or four days, after which he got about a little. The

palpitation and shortness of breath continued to some extent for two years. Physical examination at this time showed a pulse rate of about 100 when out of bed, with occasional ventricular extrasystoles after resting from exertion, to which there was poor response. He was of good athletic physique. Before the event in question he was in excellent health. He served four years in the war, during which time he won a three-mile race without discomfort.

For myself I should diagnose primary cardiac overstrain chiefly on the history. If one has understood the theory as usually taught of the reaction of the heart to effort I suppose the original conception would have been that the heart had suffered from acute dilatation. Allbutt diagnosed the condition on himself, although it led to no permanent ill effects in his case. The teaching followed that the heart did not dilate during effort. Wilson (1930) recorded exceptional circumstances which enabled him to note what he regarded as dilatation of a heart after effort, with quick return to normal. In the correspondence columns Wilkinson (1930) suggested that the dilatation in Wilson's case was only apparent, and that the diffuse impulse was due to forcible beating, adding at the same time that he did not believe that either dilatation of the heart or the strained heart existed. Those of us who believed that strain had sometimes injured a normal heart were prepared to consider whether forcible beating might injure it. Lewis (1932) recorded examination of the heart under the x-ray screen, with inspiration held and the glottis closed. He states that it is seen to dilate very greatly. There was abundant evidence that healthy men could perform this test with impunity. S. A. Smith (1931) wrote of the "erroneous diagnosis of acute dilatation of the heart." But if enough clinical evidence based on the judicious assessment of case-histories is forthcoming it is interesting to speculate that we may come back to the simple conception, which was accepted a generation ago, of acute dilatation from strain. It seems a reasonable possibility in the untrained average man undergoing an exceptional strain with the glottis closed. There may have been some defect in the pericardium or heart muscle, but examination would not have detected it, and disability would not have resulted had there been no unusual event.

It is not a common occurrence. I think I have seen four examples of hearts diseased from strain that were apparently healthy before an exceptional effort. Two have never recovered fully. The diagnosis from the effort syndrome is very difficult. Shirley Smith (1932) summarized the symptoms which simulate heart disease. There is no absolute proof of strain in any of my cases. The diagnosis has been based on the probabilities in relation to the man, the history of effort, and the report from his doctor, although a consistent non-varying degree of disability is taken to be suggestive of genuine heart disease.

S. A. Smith (1931) explains all the cases of what he calls "the erroneous diagnosis of acute dilatation" as due to a cardioneurosis, usually supervening on a minor superficial injury. I have seen a typical example of pain of muscular origin at the lower end of the sternum on the left side, from a lifting effort, for which the heart came under observation. The man could walk quickly without discomfort, and merely required reassurance. The pain passed off in a week or two. He was not a manual worker, but it is reasonable to suppose that if he had been compelled to go back to work that aggravated the pain he might have developed a cardiac neurosis. Pain which persists, however, is not a feature of primary cardiac overstrain.

It may be difficult to decide whether a man has strained his heart or whether he is suffering from the effort

pericardial friction sound may have been overlooked in some patients with severe chest injuries, in whom the possibility of a contusion of the heart must be considered subsequently.

2. *Angina Pectoris*.—Fraser (1929) gives evidence of angina of effort resulting from direct injury to the chest wall. There are also references in the German literature.

I have recently attended a man 57 years of age. He was in charge of a cart when the horse bolted and the shaft struck him over the sternum. He was laid out on the ground for a few minutes, and then slowly, with distress, walked a short distance to a farm. He was sent to hospital next day, where fracture of sternum and ribs was excluded. He was short of breath on slight effort, with pain and aching in the chest. When he began to get about, in three weeks' time, the symptoms of angina of effort developed. The shortness of breath has continued; and his case may be included under the heading of a possible contusion of the heart.

White (1937) states that fatigue of nervous type may dispose towards angina. In the foregoing patient there is this type of nervous problem to consider. I believe that the angina of effort in his case is the result of trauma. Lewis (1937) writes: "Angina pectoris and cardiac failure never can find equivalents in the terms of structure."

As an example of angina of effort the result of direct injury to the chest wall the following case is of significance because there is no question of compensation. The diagnosis is based on what the man himself and his doctor can tell us.

W. H., aged 54, has always had good health. On June 14, 1937, he tried to jump on to the rear of a lorry, which moved; he fell on his left side rather heavily, sustaining a cut head and bruised elbow and hip, and "his ribs were sore." There was no immediate discomfort, apart from his bruising; but a fortnight later, when recovered from this, he noticed that when walking briskly for a bus he got a gripping pain in the chest, radiating down the left arm, and he had to stop. This discomfort became more frequent and occurred on very slight exertion, such as mounting stairs; so that after doing a fortnight's work he had to give up. The heart was recorded as irregular and the rate unduly increased on exertion. In August the attacks were less severe, but they persisted. The pulse was regular. He has improved, but in December would still get angina with moderate exertion. On December 7, seen by myself, the heart showed no abnormal signs and an electrocardiogram was normal. The exercise tolerance was rather poor, but he was proposing to go back to his duties, which are clerical. He did not feel capable of working in his garden.

3. *Heart-block*.—This form of arrhythmia indicates a lesion deep-seated in the myocardium. It may possibly arise from direct violence; that it may result from effort is very improbable. Walker (1933) states that heart-block has been recorded after a blow on the chest wall. I have no personal knowledge of such a case, but some of the post-mortem lesions described above, which have been the effects of direct violence without any external injuries, will illustrate the fact that such an exceptional event as injury to the auriculo-ventricular bundle, with survival of the patient, is possible. White (1937) states that it may result from direct trauma. Coffin (1930) described complete heart-block, persisting seven years, after a child 3 years of age had fallen four or five feet on to his chest. There was no external bruising. "Just before the accident he scored 98 per cent. in a baby clinic examination." The slow pulse, which persisted, was recognized within a few hours of the accident.

4. *Contusion of the Heart*.—It is of course well known that a severe blow on the chest may cause death without anything definite being found in the heart post mortem. Some such examples have been the result of diving.

Certain of the ruptured hearts described above in which the accident was survived for a time may be regarded as severe contusions which have eventually ruptured into the pericardium. To diagnose a contusion of the heart muscle is a difficult problem. White (1937) states that contusion or even partial rupture of the heart wall is probably much more common than has been thought in the past, because of the usual recovery. He suggests that an electrocardiogram taken early might show changes in the T waves, which would be transient. It might be of interest to search in the surgical wards for examples of contusion of the heart.

I was asked to see a case of "bronchitis" in a surgical ward on September 16, 1937. A man aged 58 was admitted three days previously after a severe blow over the sternum from some timber. There was pain and dyspnoea. An x-ray examination excluded fracture, and the heart shadow and lungs were normal. The pulse rate was 80, and regular. The heart showed no abnormal signs, and an electrocardiogram was normal except for inversion or biphasic P wave in Lead III. There was no evidence of bronchitis and the temperature was normal, but the patient was expectorating moderate quantities of frothy serum. It was exactly comparable to the fluid coming up in acute pulmonary oedema but in much less amount. The physical signs in the lungs were quite normal, except for slightly deficient vesicular murmur, equal at both bases. I should conclude that the circulation through the lungs was inefficient on account of a contusion of the heart muscle. He was discharged after four weeks, having been about the ward for a few days. When he returned home he was short of breath on exertion. He began light work about two months after the accident, but could not carry anything up stairs or climb a ladder without distress. Examined on November 30 there were no abnormalities, except a poor exercise tolerance. The pulse rate was 84 at rest, was 100 after dressing, and rose to 144 after slowly climbing some stairs; he was short of breath. The electrocardiogram showed no change.

I have seen six other men in whom the heart appears to have been inefficient after a severe blow on the chest. There has been no record of the heart condition soon after the accident; it has only been considered weeks or months later, on account of shortness of breath on slight exertion. My first example (Barber, 1912) was lost sight of during the war, and the other five are alive. In two cases the sternum was fractured, and in two several ribs; the fifth and sixth cases are recorded above, with angina of effort. The others were aged 27, 46, 50, and 53 years, and they have never recovered fully. The symptoms have been shortness of breath on slight exertion, with dizziness. There has been left mammary pain to some degree, but true angina in only two cases. The heart showed no abnormal signs on examination, and the electrocardiogram was normal: in no case was it taken until several months after the injury. The only evidence of myocardial weakness has been inadequate response to effort. Under these circumstances it is easier to convince oneself than to produce evidence which can be recorded. White (1937) draws attention to the fact that neuro-circulatory asthenia and muscular flabbiness are more easily exposed by exercise tests than is true heart disease. Two of my patients have been colliers, whose muscles have been in reasonable training, and none of them has had the "irritable heart," unsteady under observation, which one tends to meet with in the effort syndrome. An exercise test which is reliable, even if it cannot be standardized, is to lead a patient along the hospital corridors to another department and set him talking by the way. If the proof of an inefficient heart be accepted, it is following the teachings of Lewis (1937) "not to make the attempt to diagnose in the terms of anatomy but in the more certain terms of

was found as compared with the controls. Oestrone (Korenchevsky and Dennison (1934b, 1934c) gave more uniform results when injected into normal than into castrated rats. In most cases oestrone caused a slight decrease in the actual weight of the liver, but no change, or sometimes even a slight increase, in that per unit of body weight. The fall in actual weight of the liver was due to the decreased appetite of oestrone-injected rats, with resulting decrease of body weight and of most of the organs, and not to any specific action of the hormone on the organ. Histologically no changes were found, except some increase in vacuolation of the liver cells (Korenchevsky and Dennison, 1935).

Ito and Kon (1935a and 1935b) injected purified extract of sexual hormones from male urine into infantile and adult male rats, and obtained hypertrophy of the liver in the immature rats up to 100 per cent. Bates, Riddle, and Lahr (1937) observed an increase of about 60 per cent. in weight of liver after androsterone injections, and a decrease of about 26 per cent. after oestrone injections, into adult pigeons. It is also important to note that the sexual hormones are accumulated in the liver and excreted in the bile (Gsell-Busse, 1929; Frank and Goldberger, 1930).

Present Experiments

The present paper is a description of the histology of the liver of those male rats in which the effect of injections of pure crystalline sexual hormones on the weights of this organ has already been described previously (see below). At the same time the uninjected normal and castrated control animals used in these experiments gave an opportunity for further study of the effects of castration. The hormones investigated were:

1. Androsterone, androstanediol, and their water-soluble esters (Korenchevsky, Dennison, and Levy Simpson, 1935).
2. Transdehydroandrosterone (Korenchevsky and Dennison, 1936).
3. Δ^4 -androstenedione and Δ^3 -androstenediol (Korenchevsky, Dennison, and Eldridge (1937a).
4. Testosterone (Korenchevsky, Dennison, and Brovsin, 1936; Korenchevsky, Dennison, and Hall, 1937).
5. Testosterone propionate (Korenchevsky, Dennison, and Eldridge, 1937b; Korenchevsky, Dennison, and Hall, 1937).

Technique

One hundred and eighty-one rats (fifty-one normal and 130 castrated) were investigated. Castration was usually performed at the age of 21 to 24 days, never later than 28 days—that is, always before sexual maturity. In this series of experiments, on the special mixed diet used, the changes in the liver produced by castration and injections became noticeable earlier than in the previous experiments—that is, at the age of about 70 days, about forty-five days after castration. Therefore in Table II the data for rats 70 to 150 days old only are summarized. The doses injected are shown in the same table. The hormones were dissolved in sesame oil and were injected daily, except the oestrogens, which were injected three times a week. Androsterone and androstanediol were injected in some experiments for periods up to fifty-three days, oestrone and oestradiol up to 120 days, and all the other hormones for twenty-one to twenty-three days.

Diet has a considerable influence upon the liver. In the previous experiments (Korenchevsky and Dennison, 1934a) the diet used was chiefly synthetic, while in the present

experiment the following diet of natural food products mixed into a paste was given:

Steamed herring, with bones (four times weekly)	1,020 grammes
White bread	1,350 "
Milk	1,700 c.cm.
Wheat	230 grammes
Oats (rolled)	230 "
Hemp	240 "
Wheat germ	75 "
Dried yeast	90 "
Salt mixture (McCullum's 185)	30 "

In addition each rat received twice a week 5 drops of cod-liver oil, 2 grammes of freshly minced liver, and 5 grammes of fresh carrot.

For histological investigation the liver was fixed in Bouin's solution, embedded in paraffin, and stained with haematoxylin and eosin. For fat and lipoids frozen sections were cut and stained with scharlach red. In order to compare the size of the cells, outlines of about seventy-five cells from one lobule of each liver were drawn with the aid of a camera lucida (magnification $\times 530$) from the central vein towards the periphery. The size of these outlines was compared directly, but because of their variability the number of the cells contained in a square measuring 7×7 cm. was also calculated, the

TABLE I.—Average Weights of Liver, actual and per 200 grammes of Body Weight, and Average Comparative Numbers of Lobules and of Cells of Normal ("N") and Castrated ("Ca") Rats.

Group	Age in Days	Number of Rats in Groups		Weight of Liver (grammes)				Number of Lobules		Number of Cells	
		N	Ca	Actual		Per 200 gm. of Body Weight		N	Ca	N	Ca
				N	Ca	N	Ca				
1	40-49	6	—	8.3	—	10.1	—	6	—	53	—
2	60-69	5	6	10.5	10.9	8.6	8.5	6.6	6.4	52	60

TABLE II.—Average Weights of Liver and Comparative Average Numbers of Lobules and of Cells of Rats aged 70 to 150 Days.

Group	Hormones Injected and Daily Dose (mg.)	No. of Rats	Liver			
			Weight in grammes		No. of Lobules	No. of Cells
			Actual	Per 200 gm. of Body Weight		
1	(A) Normal Rats: Control, uninjected	26	12.8	7.7	5.5	57
2	Testosterone 0.5-1.5	5	13.0	7.5	5.1	56
3	Testosterone propionate 0.5-1.5	9	13.1	7.9	5.4	56
4	(B) Castrated Rats: Control, uninjected	34	10.1	6.7	6.7	53
5	Androsterone 0.45, androstanediol 0.3	15	10.2	7.4	6.3	57
6	Androsterone 0.9-3.6, androstanediol 0.175-0.7, transdehydroandrosterone 1-4, testosterone 0.167-1.4, testosterone propionate 0.167-1.4	51	12.3	7.3	5.9	55
7	Oestrone 0.005-0.018, oestradiol 0.02	12	8.2	7.6	6.8	62
8	Oestrone 0.005-0.018 in combination with the hormones of group 6	12	9.5	7.2	6.9	62

Note.—The greater the number of lobules or cells in the measured area (columns IV and V) the smaller they are, and vice versa.

syndrome or, to use the transatlantic term, from neuro-circulatory asthenia. But from the all-important point of view of treatment the problems are not so essentially different. A short rest will be suitable for both; reassurance will help both, as also will suitable exercise and retraining. When it is admitted, as most people will, that in the effort syndrome group a man must sometimes be warned that he is not suited for intense or prolonged effort the practical considerations are identical. The divergence arises on account of compensation litigation on the one hand and of theoretical prejudgment as to whether the normal heart can be strained on the other.

The American teaching (White, 1937) seems to be that heart symptoms or signs that follow industrial strain or accidents are usually of the neuro-circulatory asthenia type, or are due to aggravation of heart trouble already existing. But Donahue (1927), in an article entitled "Accidents and Heart Disease from the Court's Point of View," writes: "We do have a great many cases of dilatation of the heart occurring at work while the employee is under some particular strain. He is lifting some unusually heavy load, or is in a rather awkward position doing heavy lifting, when he has dilatation and becomes sick, sometimes collapsing immediately." If we leave out the word "dilatation" the events are as described. Probably some are due to rupture of pectoral muscle fibres, with a cardiac neurosis superimposed. Probably some are due to the effort syndrome, to which the event has called attention. But the probability still remains that some are due to strain of the heart muscle or of the pulmonary or aortic ring. It would be in the best interests of medical science if such cases came before a medical board. We could study them with a mind more open. In those industries where there is a medical adviser to the firm he should include judicious management of the case in his decision.

We can remember that a generation ago sometimes the strained heart was diagnosed, quite mistakenly, on the evidence of a negligible systolic bruit in a growing boy. Invalidism on this account is a thing of the past. The profession has learned that the effort syndrome requires guidance and retraining, lest a selfconscious heart become permanent. Much semi-invalidism has been prevented by the accepted teaching that the heart is the part least likely to break down from exhaustion in some athletic event.

Our knowledge of physical signs and of their interpretation has advanced. There remain, however, some problems which cannot be solved by these means, and the last word must come from reliable clinical histories. By such histories, from doctors who have made notes, I believe enough evidence may be collected to prove that the healthy heart can be strained.

Summary

The forms of heart disease which have been recorded as the result of direct violence to the chest wall or as the result of strain are discussed. The conclusion is drawn that the physical signs on examination are of little assistance in assessing the diagnosis of trauma. Reliable clinical histories, in the widest sense of those terms, must be assessed with judicious care. This includes such evidence as the patient's own doctor can supply.

The clinical diagnosis of a contusion of the heart is discussed.

It is claimed that there is clinical evidence that the normal heart may become diseased as the direct result of overstrain from effort.

With regard to these two conditions, contusion of the heart and primary cardiac overstrain, it is difficult to obtain the proof that the symptoms in question are due to a genuine heart disability, but the probabilities in some cases are sufficient to justify the diagnosis.

CHANGES IN THE LIVER OF MALE RATS AFTER CASTRATION AND INJECTIONS OF SEXUAL HORMONES

BY

KATHLEEN HALL, Ph.D.

AND

VLADIMIR KORENCHEVSKY, M.D.

(From the Lister Institute, London)

Normal life of the organism is dependent to such a large extent upon the various functions of the liver that any changes observed in this organ need to be very carefully investigated. The manifold effects of castration on the different organs, including the liver, of male rats have been described in a previous paper (Korenchevsky and Dennison, 1934a). In most cases about seventy days or more after castration the actual weight of the liver was on the average 18 to 22 per cent. less than that of the control normal litter mates. When the weights were calculated per unit of body weight this decrease was not so great—namely, 11 to 18 per cent.—owing to the fact that castration also caused a decrease in the body weight of the rats. Histological investigation of paraffin sections did not show any considerable changes, although in some cases the cells of the "castration" liver were more vacuolated than those of the normal control (Korenchevsky and Dennison, 1935).

The injections of purified extracts of sexual hormones from male urine (Korenchevsky, Dennison, and Kohn-Speyer, 1933) into castrated rats were followed by an increase in the weight of the liver up to 32 per cent. (actual) and 25 per cent. (per unit of body weight). Histologically (Korenchevsky and Dennison, 1935) no difference

histologically the only definite change is a slight decrease in the size of the lobules.

3. Injections of androsterone, androstanediol, trans-dehydroandrosterone, testosterone, and testosterone propionate returned the liver of most castrated rats towards or to normal weight and structure, while testosterone and testosterone propionate had no appreciable effect upon the liver of normal rats.

4. The absence of pathological changes in the small "castrated" liver and in this organ enlarged after injections of the above sexual hormones, as well as the nature of, the changes observed, suggests a natural stimulating action of these hormones on the liver.

5. This might have a practical significance in therapy of the liver and some metabolic disturbances if the same effect of these hormones be found in the case of human liver.

6. Injections of oestrone or oestradiol into castrated rats in the doses used caused a decrease in weight of the liver to below that of the control rats but no definite histological changes. The changes in weight observed are probably due chiefly to the depressing effect of oestrogens on the appetite, with resulting decrease in gain of body weight and weight of different organs, including the liver.

Grants from the Medical Research Council and from the Lister Institute have enabled us to carry out this work, and to them our thanks are due. We are also indebted to Professor A. Girard for oestrone and oestradiol, and to Messrs. Ciba, Ltd., in particular to Dr. K. Miescher, for all the other hormones used.

The Royal Prince Alfred Hospital, Sydney, N.S.W., derives its name from H.R.H. Prince Alfred, Duke of Edinburgh, who, when visiting Sydney as Captain of H.M.S. *Galatea* in 1868, was shot and severely wounded while attending a charitable function. As a mark of their gratitude for his recovery the people of New South Wales raised a fund, which was applied to the establishment of the hospital. The fifty-third annual report covers the year ended June 30, 1937. During this period the number of beds was increased from 568 to 762 by the opening of Gloucester House, an additional building which makes available to all classes of the community, at reasonable rates, the resources of a large university hospital. In the same year of expansion the nurses' home has been doubled, a complete psychiatry pavilion with its own operating theatre, x-ray room, and special investigation facilities, including a neurosurgical unit of 15 beds, has been constructed, and a new x-ray department with the most modern equipment has been completed. In the course of the year under review 10,352 in-patients and 222,272 out-patients were treated in the public hospital, in addition to 1,724 in-patients at Gloucester House.

SCAPULO-HUMERAL PERIARTHRITIS (DUPLAY'S DISEASE)

BY

A. H. DOUTHWAITE, M.D., F.R.C.P.

Physician, Guy's Hospital

During the last three years I have seen thirty-seven patients (twenty-nine in private, eight in hospital practice) suffering from unilateral painful and stiff shoulder-joint associated with normal x-ray appearances. Although, as will be seen later, the antecedent factors leading to this state of affairs differ to some extent, yet the clinical picture is so constant and the treatment so well defined as to justify its description as a morbid entity. In searching the literature for evidence of earlier recognition of the disease, the first and most complete account was found to have been written by Duplay (1872), who recognized, however, only the post-traumatic forms. Mention of the rheumatic types has been made by Chaumet (1934), Douthwaite (1936), Tiegel (1936), and Sievers (1926).

Aetiology

Sex and Age.—There were fifteen males and twenty-two females. The average age was 60 years, and with the exception of two patients aged 33 and 34 they all fell into the fifth, sixth, and seventh decades.

Injury.—Trauma appeared to be the causative factor in twelve patients. In nearly every case it was the effect of a fall either upon the outstretched hands or upon the point of the shoulder. In one person a backward fall from a step-ladder resulted in bilateral disease. The lapse of time between the injury and the onset of typical symptoms—that is, those not simply due to bruising—varied from five days to three weeks.

Rheumatism.—Fibrositis either as simple stiff neck or more often in a widespread involvement of the shoulder-girdle preceded, or merged into, the symptoms of peri-arthritis in fourteen cases. Apart from the history it is quite impossible to distinguish between the two classes. Two patients had had recurrent gout, but whether this was aetiological related to the peri-arthritis is doubtful. In an elderly 'hemiplegic' the disease developed in the shoulder of the paralysed side three months after the cerebral haemorrhage. In eight persons stiff, painful shoulder developed without any apparent cause.

Associated Diseases.—Two patients had diabetes mellitus, and two were subject to gout.

Symptoms and Signs

The outstanding symptom is pain, which with one exception was strictly unilateral. It is often spread diffusely over the shoulder-joint, but sometimes it is referred to the anterior aspect over the long head of the biceps or lower down over the belly of this muscle. In long-standing cases the pain may be much more widespread, even extending to the forearm and fingers. It is of the nature of a dull ache if the arm is kept still, but passes into acute agony in attempted shoulder movement. Often it is of neuritic type, shooting down the limb and partaking of a boring and burning character, and made worse by getting hot in bed at night. Limitation of movement as a symptom is of secondary importance owing to the mobility of the scapula masking the actual fixation. In women, however, it is often a source of complaint that

greater the number of the cells obtained the smaller being the size of the cells. These figures, being more reliable, are given in columns IX and X of Table I and column V of Table II. Actual measurements of the size of the lobules were practically impossible owing to their irregular shape and indistinct boundaries. Therefore the number of central veins of the lobules seen in six to eight microscopical fields at $\times 90$ was calculated, the average figure obtained being given in columns VII and VIII of Table I, and column IV of Table II; the greater the number the smaller the size of the lobules, and vice versa.

Liver of Normal Rats

The data are summarized in columns I, III, V, VII, and IX of Table I. Group 6 contains only a few rats, but the data are similar to those of our previous experiments (Korenchevsky and Dennison, 1934a). Because of the difference in the diet, and because of the different method of killing the rats at the end of the experiment (gas in the previous and bleeding in the present experiments), the liver weight was greater in the former case (Korenchevsky and Dennison, 1934a, p. 239).

Effect of Age.—As was found previously and confirmed in the present experiments, the liver belongs to that group of organs of which the actual weight (column III, Table I) slowly increases with age, while the weight per unit of body weight (column V) gradually decreases after sexual maturity. This seems to indicate a particularly active role of the organ in the young animal. The decline in weight of liver per unit of body weight after sexual maturity might be explained only partly by the accumulation of inactive tissue such as fat, and probably chiefly by the lowering of the metabolism. While the size and the histological structure of the cells show no definite changes with age (column IX), the lobules appear to become slightly larger (column VII), which may partly explain the mechanism of increase in the actual weight of the liver.

Liver After Castration

The data are summarized in columns II, IV, VI, VIII, and X of Table I, and should be compared with the corresponding data for normal animals in the other columns of the same table.

Effect of Age.—In agreement with our previous results (Korenchevsky and Dennison, 1934a) the actual weight of the liver (column IV) about four weeks after castration, in contrast with the normal animals (column III), ceases to increase with age. Moreover, the weight per unit of body weight considerably decreases at the age of about 70 days (column VI) and then remains more or less stationary (Groups 3 to 6). This, as in the case of the liver of normal animals, probably indicates a more active role also of the "castration" liver in the young animal. Histologically no definite alteration was found in the liver at different ages.

Effect of Castration.—Up to the age of 70 days no definite changes were noticed in the livers of the castrated rats, but in most rats older than 70 days the weight of the liver was less than that of normal rats (columns III and IV; V and VI), the difference being on the average 21 per cent. in actual weight and 13 per cent. in relative weight. This difference in weight could in most animals be at least partly explained histologically by the smaller size (22 per cent. on the average) of the lobules in the livers of most castrated animals (columns VII and VIII). The cells themselves, however, were not smaller (columns IX and X), which suggests their hypoplasia rather than

atrophy. No mitoses, however, were found in either normal or castrated livers, and the number of binucleated cells was about the same in both groups. No degenerative or any other considerable changes were found in the cells. In about 50 per cent. of the castrated rats the protoplasm of the liver cells in paraffin sections showed an increase of vacuolation (usually only slight) as compared with the normal animals (see also Korenchevsky and Dennison, 1934a, p. 333), but staining with scharlach red showed a definite increase in lipoid granules in only a few cases. The absence of definite pathological changes in the "castration" liver, considered together with the decreased weight of the organ, suggests more a physiological than a pathological decrease in function of the liver after castration.

Effect of the Injections

The data are given in Table II—all were averaged after dividing them into eight groups. The figures in Group 1 (normal) and Group 4 (castrated rats) are the averages for the control uninjected rats aged 70 to 150 days.

Normal Rats.—Testosterone and testosterone propionate injected into normal rats (Groups 2 and 3) did not change appreciably either the weight of the liver or its histological structure (including content of lipoid granules).

Castrated Rats.—Small doses of androsterone produced no definite effect, and Δ^4 -androstenedione, in the doses used, only a slight effect (Group 5). Larger doses, of androsterone and all the doses indicated of androstanediol, transdehydroandrosterone, testosterone, and testosterone propionate (Group 6) caused in most cases a return towards or actually to normal of the weight (columns II and III) and histological structure (columns IV and V) of the liver. Since the increase was not only in the actual weight of the liver but also in that per unit of body weight, it is unlikely that this change was due to increased appetite and body weight, which usually occur in rats after these injections. Moreover, it is typical that in normal untreated animals greater appetite leads to increased gain in body weight with increased fat deposition. In the rats injected with the above hormones this was usually not the case, since an enlarged liver was present in rats with a decreased fat deposition and sometimes even with decreased gain in body weight (Korenchevsky and co-workers, 1935-7). It is probable, therefore, that these hormones exercise a special stimulating effect on the liver. Oestrogens, on the contrary, whether alone (Group 7) or in combination with the other hormones (Group 8), caused a decrease in the actual weight of the liver, while that per unit of body weight was slightly increased. As already described, this change may be explained by the loss in appetite caused by injections of the oestrogens. In "oestrogen" rats the gain in body weight and in some organs and fat deposition were usually decreased. The histological structure was similar to that of castrated uninjected rats. After injections of any of the sexual hormones used the liver cells, in some cases only, appeared to contain more lipoid granules.

Summary

1. In normal uninjected rats the weight of the liver per unit of body weight decreases with age, which probably indicates an especially active condition of the liver in the young animal.

2. In rats castrated before sexual maturity the weight of the liver (actual and per unit of body weight) at the age of 70 days or more is less than in normal rats, although

A STUDY OF MINERS' NYSTAGMUS

BY

RAYMOND S. BROCK, M.D.

This paper is based upon a study of nystagmus in fifteen pits of North Wales over a period of ten years. The nature of the eye movements is examined and the various theories as to their cause are discussed. The importance of psychological factors is considered and suggestions are offered, first, as to the prevention of disability, and, secondly, regarding a more secure basis upon which disability may be assessed.

The Eye Movements

These are strikingly different from other forms of nystagmus. The "nystagmic" eye movements of colliers are more persistent in duration, are severer in degree, and more varied in type. They may be vertical, horizontal, oblique, or circumductory, but typically are more truly rotatory in direction. They may be of different magnitude in each eye, and the severity may vary in either eye. They are increased by darkness, by elevation of visual regard, and by sudden movements. They may be set up by emotional shock, such as sudden noise. They are lessened by lowered visual regard, by convergence, and by alcohol taken by mouth. They may be recorded on a moving sensitive plate by the "photostigmagraph," which has been widely used on the Continent, or may be conveniently cinematographed by means of a simple apparatus such as one that I have constructed. By the latter means it is possible to study "stills" of the movements at intervals of one-sixteenth of a second, and these show that the actual excursion is not nearly so great as it appears to be when observed in the ordinary way.

Many theories have been put forward to account for the movements, but one point would appear to receive general acceptance—namely, the chronicity of the condition. An apparently abrupt onset is occasionally met with, but in eighty-three of my cases the average time of onset was 23.3 months, and some men noticed the condition coming on gradually over many years. This accords with the findings of other observers. Contrasted with the frequency of disability from accident at different ages, I have found that whereas this disability reaches its maximum among the younger and less experienced men, and tails off as the age groups rise, nystagmus, on the other hand, shows a relatively high incidence among the older workmen.

Theories of Causation

These may be classified as: (a) those suggesting some toxic agency; and (b) those which postulate some form of fatigue. An "unknown hydrocarbon" suggested by Pechdo (1893) still remains undemonstrated as a cause. Robson (1923) has suggested carbon monoxide as responsible, but the disorder is sometimes rife in pits where that gas is absent. More recently German observers (Zeiss, 1932; Wiedersheim, 1934) have postulated two cerebral centres—one "position-keeping" and upset by dim light, etc., and the other "co-ordinating" and upset by chronic gas poisoning. The late Professor Haldane (1922a) spent several hours in an atmosphere of 80 per cent. CH₄ and experienced no inconvenience whatsoever. On the other hand, it may be that in certain cases CO plays some part in promoting fatigue. Haldane (1931) demonstrated that this gas was formed in small quantities by the action of air on freshly cut coal, and Graham's analyses (1934) of mine air indicate in some pits enough CO to produce

maximal blood concentrations of from 9.7 to 20 per cent. In America it has been reported that prolonged blood concentrations considerably lower than this (5 to 10 per cent.) may give rise to headache, dyspnoea, easy fatigue, tremor of the hands, etc. All these are characteristic in miners' nystagmus. Tachycardia is also common, and the question arises whether nystagmic miners may display any toxic myocardial changes. I have found on electrocardiography that in a series of twenty-four nystagmus cases showing tachycardia there was no indication of a relation between the pulse frequencies and any myocardial toxæmia. On the other hand, the cases all gave typical clinical indications of function disturbance consistent with the tachycardia noted. This may be of importance in assessing disability relative to this physical sign, since the general consensus of opinion appears to be that the myocardium is not in any way affected by tachycardia of a functional character.

A bacterial origin, though suggested, has never been demonstrated (Robson and Freeland Fergus). It has also been thought that infection might be sucked up the Eustachian tubes as a result of varying atmospheric pressure in journeying up and down in the cage, and giving rise to labyrinthine upset (Alabaster, 1933), but this brings us to the various "fatigue" theories, for one of the earliest suggestions was that of labyrinthine upset, arising from the maintenance of difficult working postures, and cases were described in six compositors, a paperhanger, and some other occupations involving a strained upward regard (Snell, 1907). The objections are that the disorder is only characteristic among colliers, and that the movements are entirely different in type, magnitude, and degree from those associated with labyrinthine upset. Moreover, the introduction of "machine mining," which has largely eliminated the old difficult posture, has not allowed any great reduction in the incidence of the disorder.

Ohm (1916) produced nystagmus resembling that of miners in puppies and kittens by keeping them in the dark, and the darkness of the mine is now generally regarded as the most important factor concerned. The condition is commoner in the poorer-lit pits, and is practically unknown in "open-light" pits. The incidence has been reduced in certain observed pits by improvement of lighting, and the late Professor Haldane's words remain true, that "it is only when coal is mined under conditions of excessive darkness that nystagmus results" (Haldane, 1922b).

As to why this should cause the characteristic movements no final answer has yet been found. Some think there may be an acquired pigmentary defect, but others may prefer the suggestion of Dr. T. Gwynne Maitland (1936) of Liverpool, that in conditions of low illumination two ocular reflexes normally occur: one which fixes the visual regard on an object appearing within the visual field, and the other by which the visual regard pursues the object if moving—a primitive protective mechanism. Gwynne Maitland has demonstrated experimental nystagmus set up by prolonged activation of these reflexes, and has pointed out how closely linked is the response with the subject's emotional state. At all events the condition of the mine, with the impending falls of coal which account for approximately half the total accidents, must certainly awaken the workers' emotional state, and it might be expected that the low illumination and the constant sense of danger should bring about cases of physiological and psychological breakdown after operating for any number of years. This is my view of the disorder known as miners' nystagmus: that it is a breakdown of the man's ability to withstand the stresses of the mine.

they cannot reach the back of the head to dress the hair, and both sexes have great difficulty in washing the back. The duration of symptoms before seeking advice was on the average 5.3 months; the minimum was 1 month and the maximum $1\frac{1}{2}$ years. This is to be explained by the fact that the symptoms and signs develop insidiously, and it needs several weeks at the least for the initial discomfort to reach the level of distressing pain.

Limitation of movement is the outstanding sign. The right side was involved in twenty-one persons, the left in fifteen, and both sides in one. Fixation of the joint is best observed from behind. If the patient be instructed to extend the arms the scapula on the affected side will be seen immediately to follow the humeral movement. In abduction this is also well seen, and if the scapula be held firmly to the chest wall and an attempt made to carry this out, acute pain will be experienced. Voluntary abduction is not very painful until the arm has passed through about 30 degrees; but rotation is very painful because the scapula cannot by its movement assist in this to any appreciable extent. A slight degree of muscular wasting is evident in the majority, and affects in particular the deltoid and supraspinatus and infraspinatus. In old-standing cases it is much more extensive, and involves the arm, forearm, and even the hand. In such patients skin atrophy of the fingers, tingling, and loss of peripheral sensation may be noted. The arm is held closely to the side, and the forearm may be flexed and give rise to pain if an attempt is made to straighten it. Tender points are usually to be found, especially over the acromion, deltoid insertion, and long head of the biceps. There is no swelling of the joint, neither is there crepitus.

RADIOGRAPHIC SIGNS

Both Chaumet and Tiegel refer to x-ray appearances suggestive of linear calcification in the capsule. When seen the opacity usually extends between the acromion process and the humeral neck. I am quite convinced, however, that such a finding is a rarity and represents a late effect of chronic inflammation. In this series it was seen in only one patient. Actually the characteristic feature of scapulo-humeral periarthritis is a completely normal radiograph, in spite of stiffness of the joint. In two further cases trivial osteo-arthritis of the humeral head was seen, and in two long-standing cases considerable decalcification of the bone was present.

Appearances at Necropsy

The only recorded case of post-mortem examination of the condition is given by Duplay. He treated with manipulation and massage a male aged 53 who developed periarthritis following injury to one shoulder-joint. The result was good and the man left hospital. Two months later he returned with pneumonia and died. On the affected side the deltoid was paler than normal; the subdeltoid tissue was fibrous, exhibiting dense bands running to the upper end of the humerus. The subacromial bursa was obliterated. The tendons of the supraspinati and infraspinati had lost their polish, as had also the inferior surface of the acromion. It was evident that *subacromial bursitis was the chief lesion, with extension to neighbouring structures*. There could be seen ruptured adhesions on the inferior surface of the deltoid. The articular capsule was somewhat thickened, but the articular surfaces were quite normal. Duplay concluded that the pain caused by straightening the elbow was due to tension on the biceps caught up in the subdeltoid alveolar inflammation.

Treatment

Chaumet advises treatment by means of radiant heat, diathermy, and gentle manipulations. In obstinate cases he claims to secure good results by the application of x rays thrice weekly. He states that even the linear calcification may disappear. Tiegel advises rest in abduction and the application of heat for acute cases. The chronic he treats with fruit juice, raw fruit and vegetables, baths, and exercises. He concludes by referring to the cure of one case. It should, however, be quite obvious from what has been written that only mechanical means can be effective in producing cure. Except in the earliest cases, where rest in abduction and heat followed later by massage may be sufficient; scapulo-humeral periarthritis should be treated by manipulation under anaesthesia. This has been my practice throughout, and has resulted in every case in complete restoration of movement. In all except two patients all the symptoms and signs have disappeared in a few weeks. In the two exceptions pain has persisted to some extent. Evipan or pentothal gives sufficient time for the work. The scapula should be immobilized so far as possible by a band passing around the chest and held on the opposite side by the assistant. Forced shoulder movements must be brisk, and should be carried out in all the normal planes of movement. At certain points resistance will be encountered, and with further effort loud snaps will be heard. If there are a great number of resistant points it is unwise to break down all the adhesions at one sitting.

After-treatment

Post-manipulative pain is usually severe for one to two days. Dilaudid, 1/12 grain thrice daily, should be given for this. The arm must be abducted from the start, but the use of a splint is seldom necessary. If hard pillows are well packed into the axilla the position will be held well enough. Massage to the shoulder muscles and passive movements must be given within six hours of manipulation even though they are painful. Twice daily this physical treatment should be continued, and within three days active exercises should be begun. The ultimate success depends entirely upon the work of the masseuse and the co-operation of the patient. The total duration of treatment varies from two to twelve weeks according to the chronicity of the lesion. Treatment with x rays, baths, and dieting is futile and wastes time.

Summary

1. Scapulo-humeral periarthritis probably arises as a subacromial bursitis, with extension of inflammation to subdeltoid tissue.
2. It is caused by trauma or by rheumatism (fibrositis).
3. It is characterized by a stiff painful joint and a normal x-ray picture.
4. It should be treated by manipulation.
5. It has no tendency to spontaneous recovery.
6. The prognosis is extremely good (95 per cent. complete recovery; 5 per cent. partial recovery) provided that treatment and after-treatment are properly carried out.

MANIPULATIVE TREATMENT OF INTESTINAL SPASM

BY

J. H. CYRIAX, M.B.

Spasm of the unstriated muscle of the alimentary tract is usually disregarded or considered impossible of treatment; not all patients with a mild or transient spasm of the intestine are troubled by it, but most of them have symptoms of some sort. Two types of spasm occur: sympatheticotonic, affecting the sphincters of the alimentary tract; and vagotonic, affecting the bowel itself. The resulting discomfort is due as much to an overstretching of that part of the intestine immediately proximal to the area of spasm as to increased tension in the individual spastic muscle fibres.

Sympatheticotonic Spasm

Sympatheticotonic spasm of the pylorus and the accompanying loss of tone in the gastric musculature cause dilatation and consequently slow emptying of the stomach. The stomach also contains too much air, so that pressure is exerted upwards on the heart and the base of the left lung, and downwards on the pelvic viscera. The analogy is clear regarding spasm of the cardia with dilatation of the oesophagus and spasm of the recto-colic sphincter with megacolon, both of which conditions are relieved by section of their sympathetic supply and aggravated by division of the vagal supply—that is, their sympatheticotonic nature is well established. As the masseur's finger cannot reach these sphincters, however, they are outside the scope of this article.

The symptoms of the syndrome of pyloric spasm vary widely in intensity; patients may be bedridden or only slightly inconvenienced. They complain of tenseness and protrusion of the abdomen, much gastric flatulence, inability to eat much or breathe deeply, nausea, heartburn (caused, in my opinion, by a normal, or even subnormal, strength of acid being retained in the stomach too long), epigastric discomfort after food, palpitation, giddiness, breathlessness on exertion, insomnia, sweating hands, and often constipation. Though the appetite, which is a function of the blood-sugar level, may be good, patients feel too full to eat more after only a few mouthfuls.

Gastritis and gastric ulcer are often associated with pyloric spasm; this, I think, is primary, and the retention of acid the first step towards gastritis and its sequels. Flatulence is the result of gastric contractions against a closed pylorus; as liquid does not leave at the pylorus, gas is forced past the cardiac sphincter. If the cardia is as spastic as the pylorus, however, the patient, try as he may, cannot bring up wind, though he knows the relief that would follow. Breathlessness, giddiness, and palpitation after meals or on exertion result, and are due to upward pressure embarrassing the action of the heart.

The signs of sympatheticotonic spasm are often slight in comparison with the disability present. The patient is usually pale and thin, and looks anxious. The epigastrium and left lower ribs are prominent; there is epigastric tenderness, and the spastic pylorus can be rolled under the fingers against the spine. Gastric splashing may be detected, and there is a tympanic note on percussion over a large area; the bowel sounds are infrequent and the pulse fast. Radiological examination shows delayed emptying and poor tone of the stomach, often with visceroptosis, but nothing else.

Vagotonic Spasm

Vagotonic spasm may occur at any point from the duodenum to the rectum, where it is manifested by tenesmus. The common site is the colon ("colitis"), but the whole intestine, large and small, may be involved, or the spasm may be limited to only a few inches of bowel. The symptoms depend on the site and degree of the spasm, and the patients often feel surprisingly ill. Spasm of the distal part of the duodenum reproduces exactly the symptoms of duodenal ulcer, owing to the tension set up in the proximal segment. Spasm of the colon, if mild, causes colic and diarrhoea; if severe, colic and constipation, together with a feeling of tension within the abdomen. Spasm of the ascending colon is usually associated with dilatation of the caecum, and there is stiffness on full extension of the right thigh. Purges, by stimulating the colon to further contraction, make the constipation worse. If the rectum is involved there is difficulty and pain on defaecation. During menstruation, which is painful, vagal tone is generally increased and the abdominal symptoms are at their worst. Owing to its tight contraction a mechanical irritation of the mucous membrane of the colon is set up; mucus is secreted and voided, but apart from worrying the patient this fact is unimportant. Spasm of the jejunum and ileum is uncommon except as an extension of duodenal or colonic spasm, the symptoms of which predominate.

When the whole colon is involved the signs are obvious. The ascending and descending colon is palpable in each iliac fossa as a tender tube, the size of a thick pencil. The transverse colon lies high, and can be felt above the umbilicus on either side of the rectus muscle. The bowel sounds are frequent, the pulse usually slow. When the duodenum is spastic palpation may be difficult, but a skiagram will show the spasm and/or duodenal ileus—that is, dilatation and poor tone of that part of the duodenum proximal to the spastic area. Colonic spasm can be seen very clearly radiographically, and often a mild symptomless diverticulosis as well; this is the result of the high intracolonic pressure. Vagal tone is unaffected, but sympathetic tone is abolished, by spinal anaesthesia; at laparotomy the spastic coils that result are regularly observed. Spasm of the intestine, on the other hand, is relaxed by deep anaesthesia with ether or chloroform, so that surgeons are often sceptical of the frequency of its occurrence.

The cause of spasm of either type may be difficult to determine; in some cases no cause whatever is to be discovered. The two brief lists which follow include the more common causes, but are not exhaustive.

Causes of Sympatheticotonic Spasm

Toxaemia.—In the course of many diseases, particularly phthisis and febrile conditions, sympatheticotonic spasm is common, but its treatment is naturally that of the causative illness.

Reflex Spasm.—Cholelithiasis and chronic appendicitis—the latter often diagnosed but seldom present—both set up reflex pyloric spasm and its attendant symptoms, but are suitable for surgical rather than manipulative treatment. There is much discussion as to the true nature of "catarrhal" jaundice, but whether the abdominal symptoms are reflex, due to a duodenitis, due to spasm of the sphincter of Oddi, or part of an infective hepatitis, the fact remains that they are very amenable to manipulative treatment, which ensures proper relaxation of the pylorus and duodenum.

Pregnancy.—Early in pregnancy vomiting due to pyloric spasticity is common and responds well to manual treatment.

The condition is typically associated with psychoneurosis, and many of the symptoms are characteristic. For example, diarrhoea and precipitate micturition occasioned by excitement; insomnia; bad dreams; nausea and even vomiting—usually noticed first thing in the morning, just like the nausea of pregnancy. Phobias of various kinds are often described. Of my cases, a consecutive series of 118 showed the following analysis:

Headache	116	Nausea and sickness ..	71
Giddiness	115	Diarrhoea	6
Disturbed sight	106	Precipitate micturition ..	6
Insomnia	87	Dreams	6

The physical signs are also characteristic—the tachycardia; sweating, marked tremor, twitching of facial muscles, and the general mental state. Men often show an appearance of “crystallized panic.”

Functional and Economic Factors

Numerous references to the functional element in the disorder have been made from 1887 to the present time (Dickson, 1933), and it has become recognized that “the state known as miners’ nystagmus may be a psychoneurosis arising independently of any disorder of the eye movements or of vision, while in other cases psychoneurotic symptoms arise from the disturbance of vision connected with nystagmus itself, just as in the psychoneuroses of warfare some old injury or organic affection often determines the locality of a hysterical paralysis or anaesthesia . . . psychological conflicts of various kinds, sexual disturbances, or domestic worries all (may) contribute to the final breakdown” (Nystagmus Committee Report).

My experience in North Wales endorses this view. It has been found extremely rare for a man to give up work on account of eye movements alone. A close scrutiny of the case almost invariably discloses some other aetiological factor, which has finally determined cessation of work. The condition appears to depend upon the equation of two factors: the degree of strain, and the man’s ability to withstand such strain; and McCoull (1932) also has shown that the condition is much more likely to arise in men of impoverished mental equipment.

Strain of an economic nature frequently decides the balance of the equation. North Wales is a striking example of this. During the last decade the highest annual incidence in the whole coalfield was nearly four times more than the corresponding figures for the whole of Great Britain during the past twenty-six years. This high incidence in North Wales corresponded with a marked fall in the number of men employed, for trade was bad and many pits had to close.

While investigating the fifteen pits of North Wales I found that whenever large numbers of men were discharged there was at once a rush to be certified. In one case the average annual incidence for eight years was 0.37 per cent. of the men employed below ground, and never above 0.86 per cent., but during the year the pit closed the incidence jumped up to 2.59 per cent. In another pit the average rate for six years was 1.09 and never above 1.61 per cent., but during the last two years that the pit remained open, and while large numbers of men were being discharged, the rate jumped up to 6.72 per cent. Many of these men declared quite frankly that they *could* work if only they had the chance to do so, but, as they often added, “a man must live.” Yet, having once been certified—the die having been cast—many of them proceeded to develop chronic neuroses with tremor, tachycardia, sweating, etc., and a depressed and melancholy state of mind.

Here, then, we see how an additional economic factor may operate and may create the appearance of an epidemic. The claiming of compensation became widely known and customary. It became “the thing to do.” It was this which I believe accounted for that large prevalence in North Wales mentioned earlier.

Suggested Lines of Attack

With all these facts in mind I see the following lines of attack in the prevention of disability from the malady:

1. *Concerning the Panel Doctor.*—Treatment of concurrent ill-health, such as anaemia, cardiac disease, focal infection, etc.
2. *Concerning the Workman.*—Avoidance of alcoholism and excesses of all kinds.
3. *Concerning the “Compensation” Doctor.*—Discovery of any particular stress, such as distance from pit bottom, defective light, sense of danger, prevalence of noise, etc., any one of which may predominate in taxing the man’s tolerance. An appropriate change of job, if recommended to and accepted by the employer, may prevent a man’s failure.
4. *Concerning the Colliery Companies.*—Diminution of stress by improvement of illumination and ventilation; white-washing and stone-dusting. Setting up of experimental zones in which speed of work is slowed down. Provision of light work for affected men. Re-employment of men suitably recovered. Recognition of the nature of the condition and sympathetic co-operation in re-educating men to tolerate the full stresses once more. Possibly some form of pension scheme devised to remove the incentive to retire “on compensation.”
5. *Concerning the Medical Officers who have to Examine Applicants for Work at the Mines.*—Namely, refusal of those showing impoverished mentality, deafness, or any defect calculated to render the stresses of the mine more acutely felt.
6. *Concerning the Medical Referee.*—Stricter assessment of disability on the basis that the disorder is not of an organic character, that eye movement is not proof of disablement, and that tachycardia is not a bar to employment. The writer suggests that an attempt should be made to decide whether the determining stress arises from the mine work itself or from independent sources.

Summary

1. Prolonged work below ground may bring about oscillation of the eyes which does not necessarily cause disablement.
2. When disability does arise it is usually due to an associated psychoneurosis.
3. The prevention of this depends upon: (a) recognition of the foregoing facts; (b) the treatment of contributory disorders; (c) diminished stress in the mine; (d) the barring of unsuitable applicants; (e) improved economic conditions; (f) stricter assessment of disablement.

should in theory be useful for sympatheticonia, I have not tried. Because of the patient's insistence that his present food disagrees with him, various diets will usually have been tried, and it is well to outline one consisting of foods that provide much nourishment in little bulk. Lying on the right side after meals and belts to raise the abdominal contents are not much use because it is not the position of the hollow viscera that matters but their tone.

Manipulative Treatment

Manipulative treatment is not the treatment of choice, as it requires daily attendance for perhaps some weeks, but it is the only treatment left untried by most of my patients. The fact that the patient has already had massage to the abdomen without relief is no bar to the method described below, which differs fundamentally from that used by masseurs. They are taught to massage the anterior abdominal wall and to try to push onwards the contents of the bowel, whereas the aim of the treatment outlined here is to relax the intestinal spasm so that no obstacle remains to hinder passage along the bowel. Before treatment begins all medicines must be stopped. If the patient has taken a purge regularly this may—but surprisingly often does not—result in the bowels not being opened for three or four days, but, after this, evacuation gradually becomes regular. The patient can be told that constipation is perfectly harmless so long as no attempt is made to treat it. In any case he is encouraged not to give in by the fact that the expected results of constipation—for example, headache and malaise—seldom appear under daily treatment.

The basic principle of all deep massage is not to allow movement between the patient's skin and the masseur's finger. Nowhere is this principle better illustrated than in massage of the intestine through the whole thickness of the anterior abdominal wall. The masseur's finger and the abdominal parietes must move as one, so that the intestine is directly affected. The patient adopts a half-lying position, relaxes his abdominal wall as best he can, and the spastic parts are identified. To begin with, the utmost gentleness may be necessary, since as soon as pain is evoked the muscles tense and treatment becomes impossible. With the hand and forearm horizontal, vibrations are transmitted to the intestine with the pads of the fingers. In patients who do well quickly the spasm may be felt and heard to relax after, say, fifteen minutes' vibratory treatment; in obstinate cases this desirable result may be achieved only after several weeks. From day to day the spastic point becomes less easy to palpate. Towards the end of the half-hour treatment, when the pylorus is relaxing, the stomach must be squeezed, so as to encourage its overstretched musculature to contract and expel some of its contents. The masseur stands facing the patient's feet, and bends forwards with the left hand on the patient's left lower ribs and the right indenting the mid-abdomen. The stomach is compressed between the masseur's two hands moving synchronously, the left hand medially, the right hand upwards. (In gastric ulcer, of course, this part of the treatment is omitted.) In spasm of the colon the same attempt is made in the right iliac fossa to diminish the size of the caecum. Finally, spinal nerve frictions are given; in sympatheticonic spasm, only to the sacrum where they cause reflex excitation of the sacral parasympathetic nerves; in vagotonic spasm in the mid-thoracic to mid-lumbar region, to stimulate the sympathetic.

If the perineum is lax active exercise of the levator ani muscle can restore its tone, even years after childbirth.

In "catarrhal" jaundice the treatment is the same as for a spastic pylorus, except that the duodenum must also receive treatment: the abdominal symptoms are usually fully relieved and the duration of pale stools reduced to a few days. The resting pulse rate gives a good indication of the patient's progress in cases of dilatation of the stomach; the rate falls from over 80 to under 70 when taken under standard conditions. A small increase in weight is common on improvement from sympatheticonia. The patients are treated daily until they are much better, whereupon the interval between treatments is increased. When the patient remains well on a weekly treatment he can be discharged. Relapses are rare, and one or two prompt visits suffice to stop them. Dysmenorrhoea is often greatly benefited for no very obvious reason. Patients whom years of ill-health have dispirited must be encouraged to take up curtailed activities again, so that they are leading approximately normal lives by the time that treatment ceases. Of the last fifty patients treated by me forty-three have remained well for a year or more after discharge.

Conclusion

Great improvement, even cure, of long-standing abdominal trouble can be achieved by manual treatment to the gastro-intestinal tract: vibrations to relax the spasm, manipulation to contract the proximal viscus, and the appropriate spinal nerve frictions. Fortunately, gut that has been educated to ignore the impulses that are upsetting its function stays unresponsive; hence relief is usually permanent. The treatment, as outlined here, is expressed in its simplest terms, and experience suggests many variations in technique, but the fundamental fact that manual vibrations relax intestinal spasm does not alter. Daily practice for months is necessary for proficiency, but even when given imperfectly the treatment achieves its effect, albeit more slowly. There must be a large group of patients who would benefit from manipulative treatment of their gastro-intestinal tract, but whose medical advisers are but dimly aware of this method's possibilities, even existence. Nevertheless, there is nothing unreasonable about it, and now that surgical manipulation is so well established it is to be hoped that the profession will not arbitrarily reject the idea of medical manipulation.

G. B. Costa-Starico and M. Miglietta (*Arch. ital. Chir.*, 1937, 47, 3, 281) state that the beneficial effect of maggots on suppurating wounds was observed by Ambroise Paré during the war in Flanders in the sixteenth century, and later by Larrey in the Napoleonic campaign in Syria. The American surgeon W. S. Baer, however, (*J. Bone Jt. Surg.*, July, 1931) was the first to make scientific use of the method of applying blowfly larvae in chronic osteomyelitis, having noticed in the great war that neglected wounds swarming with larvae healed with surprising rapidity. He therefore applied the larvae in eighty-nine cases of chronic osteomyelitis with gratifying results, which were confirmed by subsequent observers, including the present writers, who record six illustrative cases in patients aged from 4 to 29, and come to the following conclusions. The larvae of flies constitute a valuable addition to the surgical treatment of chronic osteomyelitis. In dissolving the necrotic tissue by their ferments and absorbing it the larvae facilitate the discharge of small sequestra embedded in unhealthy granulation tissue. The method moreover cleans up the wound and accelerates the process of recovery, this action probably being due to mechanical irritation. Lastly, it favours the production of a good smooth and solid cicatrix which does not contract or interfere with proper functioning of the limb.

After Anaesthesia.—Particularly after laparotomy under a general anaesthetic pyloric spasm and gross dilatation of the stomach may result and cause persistent vomiting and pain due to tension on the wound. If a patient already the subject of spasm of the pylorus is subjected to an abdominal operation it is important that he should receive manipulative treatment from the first, especially if a spinal anaesthetic is not given.

Psychogenic Spasm.—It is essential to realize that in this large group of patients the symptoms are by no means imaginary. Their sensations correspond to definite visceral disturbances caused by impulses carried in the sympathetic system as the result of emotional stress, usually anxiety, prolonged dissatisfaction, or over-tiredness. That this sympathetic mechanism will be called into play is particularly likely in sensitive and intelligent people who feel deeply but are too controlled to give their emotions free play; hence these are repressed into seeking a visceral outlet. Emotion in mammals other than man leads to combat or flight, the preparation for which is brought about by a high sympathetic tone that results in, among other things, cessation of gastro-intestinal activity. In man, unfortunately, this preparation for violent action is seldom useful, as the emotion is more often intellectual and lasting than physical and momentary. Even an improvement in the patient's circumstances does not necessarily result in the cure of spasm of psychogenic origin, because the derangement of visceral movement may have become a deeply ingrained habit. The good results claimed for such apparently different methods of treatment as psychotherapy and sympathectomy in, for example, achalasia of the cardia are seen to involve no contradiction; both result in an inhibition of sympathetic impulses to the sphincter. The method of re-education of the intestine described below offers a third approach to the problem; if the spastic point can be reached by the masseur's finger, relaxation can be obtained in spite of the continuance of an excessive sympathetic tone.

Causes of Vagotonic Spasm

Mechanical Irritation.—A high-roughage diet or the liquids used in colonic irrigation may set up colonic spasm. Purges irritate the intestine, and since constipation is common are often persevered with, in spite of their failure to help. Occasionally diseases of the colon, such as dysentery, may after cure leave a colon liable to spasm.

Pregnancy.—Especially during the second half of pregnancy spasm of the colon is apt to occur. Many cases of hyperemesis gravidarum fall under this heading. In one patient a spastic loop had even forced its way between the uterus and the anterior abdominal wall, whence repeated reposition was necessary.

Allergy.—Attacks of violent diarrhoea followed by colic and constipation, with even prostration and syncope, occur in those sensitive to certain foods. The treatment is, of course, identification of the food responsible and its avoidance.

Hypocalcaemia.—This promotes a high vagal tone as well as increasing the excitability of the intestinal muscle. I have come across the condition only twice. The patients had blood calcium levels of 7.0 and 8.9 mg. per 100 c.cm. of blood respectively, with inorganic phosphorus blood levels of 5.3 and 3.2 mg. Injections of vitamin D raised the calcium figure to 12.3 and 12.2 mg., while that for phosphorus fell to 2.7 and 2.9 mg. In spite of this satisfactory change there was only improvement and no cure of the intestinal condition in each patient. Manipulative treatment afforded one of them great relief, but it has to be continued at fortnightly intervals; the other patient obtained full relief that has now lasted for six months.

Psychogenic Spasm.—Whereas anxiety tends to increase sympathetic tone, prolonged mild excitement stimulates the vagus. A large group of patients whose vagotonic spasm originates in this way includes those in executive positions with important decisions to make, engaged couples, and creative artists, all of whose preoccupations are to some extent pleasurable. Obviously, some problems will cause excitement in one person and anxiety in another.

Differential Diagnosis

By the time patients are prepared to try manipulative abdominal treatment they have usually been exhaustively investigated already. The length of history as a rule excludes a diagnosis of growth or early phthisis. There may be persistent discomfort and tenderness in the right hypochondrium, with flatulent indigestion suggesting cholelithiasis, and yet a normal radiological filling and emptying of the gall-bladder. In these cases spasm of the duodenum or of the colon near the hepatic flexure may be responsible. Spasm of the ascending colon is so often diagnosed as inflammation of the appendix that this has usually been removed. Appendicectomy, followed by a return of symptoms, possibly attributed to adhesions, suggests that the condition was ascending colonic spasm from the first. As appendicitis is accompanied by diminution of bowel movement in its neighbourhood, and spasm by excessive movement, auscultation for bowel sounds often points towards the correct diagnosis. There is, of course, no rise of temperature or pulse rate in spasm of the colon, but there may be constipation, and tenderness in the right—and often also the left—iliac fossa. Peptic ulcer is excluded by radiography in cases of pyloric or duodenal spasm, but, as an adjuvant measure, manipulative methods are not necessarily contraindicated in gastric ulcer, which can only benefit from relaxation of the pylorus. Achlorhydric diarrhoea and lead poisoning must be kept in mind. Heart disease is often suspected in the syndrome of pyloric spasm, and some cases of "effort syndrome" fall into this category. In constipation due to otherwise symptomless hypothyroidism, the lack of spasm, the slow pulse, and the silence on auscultation for bowel sounds give the clue to the correct diagnosis.

General Treatment

Whatever treatment is adopted it is essential to explain to the patient the way in which his symptoms arise. The idea that some part of the intestine, palpable by the physician and identified to the patient by the tenderness elicited, suffers a persistent contraction is well within the patient's grasp. Mistaken ideas to which the patient adheres firmly must be disposed of. They are: first, that his troubles are due to some unidentified foodstuff disagreeing with him; second, that for good health the bowels must be made to open at least once a day. A brief review of the ups and downs reported in the history quickly corrects the first fallacy, and the patient can be told that within reason it does not matter how seldom his bowels open so long as he does not take a purge. Manipulative treatment usually does result in a daily motion, but patients with severe colonic spasm often feel at their best when the bowels open only every other day.

The patients I see are those whom medicines and diets have failed to benefit, so that my opinions on the following points may be biased. Patients with a resting pulse rate of under 60, excessive salivation, and intestinal spasm are often helped by atropine, but colonic spasm alone appears not to benefit. To give atropine for pyloric spasm is illogical and useless; for this the correct drug theoretically is ergotoxine (not ergometrine), but I have not found any good effect follow its administration. My experience of papaverine has been disappointing; alkalis and bromides have, of course, already been given to most of these patients. For vaccines I can see no justification, and I have never tried Irish moss or bran. Calcium, by diminishing cellular excitability and increasing sympathetic tone, is a useful drug in vagotonia; its opposite, potassium, which

structural, and that in a large majority of the cases there is no evidence of an actual persistence of gonococci. The use of strong antiseptics is irrational, and serves only to increase the mischief by further injuring the mucous membrane. The use of local heating by means of hollow bougies heated by a stream of warm water or by diathermy is unlikely to be of great value. In very resistant cases cautious dilatation with the straight Kollmann dilator may be tried occasionally, but no very striking results are obtained, and in careless or unskilled hands the instrument is a dangerous one. Vaccines or non-specific protein therapy may be given. The action of the vaccines is probably non-specific also, since serological and bacteriological findings suggest that actual gonococcal infection is usually no longer present.

The most satisfactory results are obtained by patient urethral massage over a prolonged period. Massage should not be applied if the urine is hazy. This shows that there is a subacute urethritis or a cystitis present; these may be differentiated by the usual methods. Daily irrigation for a week or two with the solutions already mentioned and the administration of an alkaline diuretic mixture, which may contain 7½ minims of tincture of belladonna or one-half drachm of tincture of hyoscyamus to the dose, will usually clear up this difficulty. In a resistant case the mandelic acid treatment may be tried.

Tests of Cure

A common early effect of treatment is to increase the amount of discharge and the amount of pus contained in it. This need cause no alarm; it indicates that the follicles are being emptied and shows that the mucous membrane is reacting to treatment. Large palpable follicles become smaller, as may be observed with the urethroscope. If not already negative the complement-fixation test becomes weaker and ultimately negative. A case may be considered cured when an absence of the objective signs has been maintained for several months after the treatment has been suspended. Attempts should be made to provoke a return of symptoms by the intracutaneous injection of provocative agents—for example, 200 millions of a mixed vaccine of gonococci, staphylococci, *B. coli*, and streptococci, or of 1 c.cm. of aolan. It is not always possible in severe and long-standing cases to restore a completely normal urethroscopic picture, and in such cases relapses are to be expected, as the resistance of the mucous membrane is presumably lowered. It must also be remembered that some of these patients also suffer from a chronic "gonophobia," and may continue to complain of vague subjective discomfort. They return again and again to ask if they are "all right," they ask to have their cerebrospinal fluid tested, and ascribe herpes genitalis and many other things to their former indiscretions. Once one is reasonably satisfied that the organic basis of their symptoms is removed they are to be firmly reassured and if necessary referred for psychotherapy.

The complement-fixation test is not, as has been already stated, of much help in the diagnosis of this condition: it has complicated the question of cure in this as in other chronic sequelae of acute gonorrhoea. One sometimes finds that although all the other signs have cleared up in a certain case there still remains a greater or less degree of complement fixation. It is difficult to know what to do in such cases. Sometimes a negative test can be obtained after the patient has been given prostatic massage twice weekly in addition to his urethral massage for six or eight weeks, but whether this is *post hoc* or

propter hoc is another question. One feels uneasy at telling a patient who still does not give a clear negative test that he is cured, and, on the other hand, one hesitates to prolong treatment unnecessarily, particularly as this may have serious effects on the patient's mental state and may also lead to marital discord. The problem appears to have no completely satisfactory solution in the present state of our knowledge.

I wish to express my thanks to Dr. A. O. Ross, senior venereal diseases officer at Liverpool, who first drew my attention to this condition and to the part played by the hard syringe in its production; and also to Dr. Mannikowitch, venereal diseases officer for Salford, for his encouragement and for permission to publish this paper.

Clinical Memoranda

"Sympathetic Twins"

The element of pure coincidence or obscure aetiological association makes these cases worthy of record. The history involves X. and Y., male twins aged 41, both unmarried, and living together in one household.

On December 10, 1937, Y., a stout man of robust appearance, was sent into the Royal Victoria Hospital, Belfast, by me with a diagnosis of gastric or duodenal ulcer perforation. Laparotomy revealed a perforation of an apparently chronic ulcer situated at the junction of the first and second parts of the duodenum.

On the following day X., a thin under-developed man of haggard appearance, complained of epigastric pain and had a small haematemesis and melaena. Forty-eight hours later he presented signs of an acute abdomen. He was admitted to the same hospital, and laparotomy revealed a perforation of an apparently chronic ulcer at the junction of the first and second parts of the duodenum.

Both these men have been known to me for several years, and although they consulted me on occasions with vague dyspepsia neither had at any time signs or symptoms suggestive of duodenal ulcer. The existence of a duodenal diathesis is commonly seen in practice, and the tendency in this family is heightened by the brothers living together and being presumably subjected to similar gastronomic indiscretions.

I am assuming that my patients are dizygotic (dissimilar, fraternal) twins. I base this on the fact of their entirely dissimilar appearance and general build, the verified history that they never resembled each other at any period of their lives, and, finally, their complete dispositional and temperamental dissimilarity. Newman (1917) points out the difficulty of differentiating the type of twins in adult life and discusses Wilder's method of comparing friction—skin, palm, and sole patterns. In monozygous or identical twins these show a pronounced similarity which does not exist in dizygotics. This is an elaboration of the methods used in criminology.

The coincidental occurrence of diseases in twins is but seldom reported in our literature, though it must be relatively frequent. Watson (1932), reporting the occurrence of diabetes mellitus in twins, refers to the fact that in recent literature the total number of recorded incidences of this association is twenty cases. He points out that practically all diabetic twins are of the monozygotic variety, and he discusses hereditary predisposition as an aetiological factor. Meltzer (1935) reports gastric

CHRONIC LITTRITIS

BY

R. C. WEBSTER, B.Sc., M.D.

Assistant Venereal Diseases Officer, Salford

Chronic inflammation of the glands of Littre is one of the common sequelae of acute gonorrhoea. It is of considerable importance not only to the individual affected but also to the community, since it may cause the infective state to persist or may provoke a non-specific leucorrhoea in the patient's sexual partner. It is largely, if not indeed entirely, due to improper treatment and is therefore preventable.

Signs and Symptoms

Urethral discharge, which is commonly slight in amount but may be profuse for longer or shorter periods, especially in neurotic patients, is usually most marked in the morning before micturating; its appearance is often intermittent. Microscopical examination shows tangled threads of mucus, epithelial cells, a few pus cells, and some bacteria; the urinary threads show similar appearances. Pus cells of polymorphonuclear type are not numerous, but may be more abundant during exacerbations. The bacteria are scanty as a rule; various types of cocci are seen, a few bacilli, and occasionally some coarsely spiral organisms; gonococci are not often found, but may be seen after certain provocative stimuli, such as coitus, the taking of alcohol, or the intracutaneous injection of aolan and similar products, or of gonococcal vaccine.

In a two-glass test urinary threads may be most numerous in, or even entirely confined to, the first glass. The most characteristic type is a very fine comma-shaped or "exclamation mark" thread. Ill-defined sensations of "burning" or "tingling" are reported by many patients; the sensations are localized in the penis, and are of course most marked in neurotic types. The complement-fixation test may confirm the diagnosis, but cannot exclude it. Enlarged follicles may be felt on palpation of the urethra over a straight sound, or seen with the urethroscope. They appear as small purplish-red points, which may be slightly raised or depressed. Sometimes a rather larger pit with thickened margins is seen at the site of an old follicular abscess. The most characteristic appearance, which is seen in well-marked cases, is that of a double row of enlarged follicles opening into the crypts in the roof of the urethra. Hyperaemic areas, with superficial erosion of the mucosa, may be seen in some cases.

Aetiology

The essential factor in causation appears to be improper treatment—that is, treatment in which the urethra is exposed to fluids at high pressure. Urethral irrigations may be given by means of a douche acting by hydrostatic pressure or by means of a hand syringe. The hand syringe was formerly widely used in the treatment of gonorrhoea, and although it has now been largely superseded by douches its use still survives, in particular with those patients who attempt self-treatment, but also with those practitioners who are only occasionally called upon to treat gonorrhoea, and who lack the more cumbersome apparatus—and have not a proper understanding of the very real dangers of the syringe.

The patient using a hand syringe can readily produce very high intra-urethral pressure; since the pressure depends on muscular action it is variable within wide

limits, and no objective measurement is possible. The pressure in the canal varies with that in the syringe inversely as the cross-section of the canal and of the piston of the syringe, and is of course a high multiple of that applied. The capacity of the ordinary syringe is relatively small, so that the urethra is washed with small quantities of fluid at a time. The use of the syringe is so often associated with attempts at self-treatment, or with treatment by those who are unfamiliar with venereal diseases, that it is not surprising that such patients often have not had routine blood tests for occult syphilis, or satisfactory, or indeed any, tests for cure of gonorrhoea. Although clinical and serological findings show that syphilis is not a factor in the causation of chronic littritis, the two conditions are of course not mutually exclusive. Patients frequently maintain their misguided efforts with a hand syringe for extravagantly long periods; a history of daily syringing for over a year is not unusual. In many cases from six weeks' to three months' use of the hand syringe is sufficient to produce chronic littritis. The same may be said of the use of strong or unusual solutions—for example, strong permanganate solutions, hair lotions, mouth-washes, olive oil—but the lesion can be produced by the syringe alone without these additional errors.

Comparison of Cases

In a large series of urethroscopies, such as are performed at the Salford Clinic in the tests for cure in all cases of urethritis, there is a striking contrast between those patients who have irrigated correctly and those who have used a hand syringe; on the one hand a monotonous series of normal urethrae, on the other a large number of cases of chronic littritis. The patient may complain of vague discomfort referred to the urethra, he may have a slight discharge occasionally on rising in the morning, and the urine may show small threads. He often stoutly denies that he has ever had urethritis or used a hand syringe for the prophylaxis of venereal diseases. When one has seen with the urethroscope that he certainly has a chronic littritis, the confident assertion that he has used a syringe or a sudden question which takes him off his guard will usually cause him to admit the correctness of the deduction. It must again be emphasized that these patients are liable to exacerbations following coitus even with a healthy female; the damaged mucosa also seems readily to acquire non-specific urethritis. Thus when first seen the patient may have a subacute urethritis which masks the underlying condition. The question of acute gonorrhoea is investigated in the usual manner, and he is then treated for his subacute urethritis; when this subsides the true state of affairs is discovered. The influence of excessive pressure in producing chronic littritis is also shown by the fact that one occasionally meets with it in those patients who have used an irrigator of the hydrostatic type but with the reservoir excessively elevated.

Treatment

The patient must abstain from alcohol, highly seasoned dishes, sexual relations, and sexual excitement. The urethra is gently irrigated with weak solutions; the words "gently" and "weak" must be emphasized. A solution of 1 in 10,000 mercury oxycyanide or 1 in 10,000 chloramine-T may be used. The anterior urethra is then massaged, at first lightly, later with increasing firmness though never roughly, over a straight sound. Treatment twice in each week is directed not at forcible eradication of the disease but rather at gentle stimulation of the mucosa. It is to be remembered that the lesion is

ALLERGIC MANIFESTATIONS

Clinical Allergy due to Foods, Inhalants, Contactants, Fungi Bacteria, and Other Causes. By Albert H. Rowe, M.S., M.D. (Pp. 812, 37s. 6d.) London: Baillière, Tindall and Cox, 1937.

In his book on clinical allergy Dr. A. H. Rowe emphasizes the importance of allergic manifestations in the patient's system, and points out that any tissue may become sensitized. As instanced, the gastro-intestinal, neurological, ophthalmological, and dermatological systems may be severally affected. Dr. Rowe is especially interested in food allergy, but recognizes other causes. He suggests that allergy is in the nature of a defensive mechanism and discusses the antigen-antibody reaction. The theory of this reaction is examined in full and the hereditary factor is adequately dealt with. He stresses the point that positive skin reactions are not necessarily obtained by the food to which the patient is sensitive, but that the causes of the condition may be ascertained by elimination diets, and gives a very useful table to show how this may be done. He emphasizes the importance of a carefully recorded history. The technique of skin testing is adequately discussed, including the Prausnitz-Küstner reaction.

Elimination diets are described in much detail, and will be found very useful when investigating a specific case of suspected allergy. It is, of course, difficult to draw up a diet sheet, and in this respect the tables will be helpful. Desensitization by giving gradually increasing quantities of the food to which the patient may be sensitive is discussed, as well as hypodermic desensitization. Dr. Rowe is of the opinion that the theory of achlorhydria as a cause of allergy is not founded on a firm basis.

A special section is devoted to pollen allergy and its treatment. There are also chapters on general treatment and a full description of the allergic dermatoses. Nasal, urogenital, and joint allergy are well described.

Perhaps the most interesting section is that on the subject with which the author is particularly concerned—namely, food and drug allergies—and the book will be found most useful in helping the practitioner to deal with a case of food allergy. There is an appendix containing illustrated case histories and many hints on the management and treatment of allergic patients.

The book is well written and well printed, and will be valued by those interested in the subject.

OPERATIVE DENTISTRY

A Text Book of Operative Dentistry. By William Harper Owen McGehee, D.D.S., M.D., F.A.C.D. (Pp. 922; 1,040 figures. 42s.) Second edition, revised. London: J. and A. Churchill Ltd., 1937.

McGehee thinks the scope of operative dentistry should be limited to those affections of the oral cavity resulting from dental caries, erosion or abrasion, exposure or infection of the dental pulp and its sequelae, and to manifestations of pathological disturbances of the periodontal membrane resulting from pulp diseases. He excludes pyorrhea, exodontia, anaesthesia, planting of teeth, the technique of radiology, orthodontia, minor oral surgery, dental anatomy, histology, and pathology as fields for the several specialists. He yet finds matter for a volume of 900 pages with over 1,000 illustrations. The chapters on prevention of oral diseases afford much inter-

esting reading (especially we note the discussion of the value of dentifrices) and at the same time food for criticism. What value is there, for instance, in such a statement (p. 137) as, "The condition is due . . . in rickets, gout, diabetes to the fact that not only is the vital resistance of the teeth lowered, but that also in these conditions there is supposedly [our italics] an excess of ammonium chloride found in the blood which, reaching the vessels of the pulp, produces a dissolution or softening of the hard tissues of the teeth"? And how are we to reconcile the statement (p. 183) that monocalcium phosphate predominates in the saliva in caries susceptibility while tricalcium phosphate predominates in immunity with that on page 188 that the resting saliva is hyper-acid in all cases of immunity and hypo-acid in susceptibility? The chapters on gold amalgam and cement fillings and on gold and porcelain inlays and porcelain jacket-crowns are most practical, and include a new form of interstitial cavity preparation: while the discussion on root-filling is marked by sound common sense, though we have to confess that at the end we are left wondering whether any—but the straightest and simplest root-canal can be successfully filled.

Perhaps it is a fault on the right side, but we think Dr. McGehee's book is overillustrated, and in some cases (for example, Fig. 12) the illustration does not show all the legend claims. The book is another evidence of the high ideals of American dentists.

CHRONAXIA

Interprétation du Fonctionnement du Système Nerveux par la Motion de Subordination: Subordination et Posture. By Pierre Mollaret. (Pp. 442. 60 fr.) Paris: Masson et Cie, 1937.

The French school of neurology has a great tradition to maintain, and recently its brilliant work on chronaxia has been entirely worthy of this tradition. Dr. Pierre Mollaret has undertaken a survey of this work and thereby advanced an interpretation of the function of the nervous system based on the concept of subordination.

The foundations of three great recent advances in the understanding of the function of the nervous system have been Cajal's demonstration that the nervous system presents a histological discontinuity; Sherrington's proof that in this discontinuity the transmission of the nervous impulse displays a choice at each synapse; and Lapicque's concept that the explanation of this "choice" lies not in spatial but in chronological data. The study of chronaxia has established certain laws. The chronaxia of any given muscle is fixed. Certain muscle groups show similar chronaxias, and these correspond to definite segments of the limbs. The chronaxias of the distal groups are longer than those of the proximal groups. The chronaxial classification of muscles thus obtained is not anatomical but functional. The chronaxias of agonist muscles are in a 2 to 1 or 1 to 2 proportion to those of the antagonists.

Testing chronaxia in the central nervous system it is found that it is the same throughout the neuronic chain from cortex to muscle provided this is healthy, but in illness this isochronaxia may be seriously upset. Similarly, on the sensory side there would seem to be a constancy of the chronaxia throughout the transmission path of a given sensation and simple relations between the chronaxia of different sensations. In reflex paths there would seem to be isochronaxia on both sensory and motor sides of the arc. Chronaxia in the vegetative system is being studied, but no definite conclusions have yet emerged.

The concept of subordination has been proved by many experiments on all sorts of animals, and is that the

carcinomata occurring simultaneously and symmetrically in monozygotic twins, and states his inability to find a similar case recorded.

SUMMARY

Similar, symmetrical, and simultaneous duodenal ulcers occurring in dizygotic male twins are reported.

The ulcers in each case were apparently of some chronicity and clinically of the silent type.

These chronic ulcers perforated in each case within a matter of hours.

These cases tend to support the theory of a diathesis and a close hereditary association in the aetiology of duodenal ulceration.

The coincidental perforations could be attributed in some measure to the sympathetic and psychic affinities said to exist in twins.

A Personal Account of the After-effects of the Modern Treatment of Carcinoma

I doubt if the results of the modern treatment of malignant disease by the combined methods of x rays, radium, and the surgeon's knife are as well known as they should be. The history of my own case, told partly as a patient and partly as a surgeon, may be of interest. In February, 1937, I found that I had an epithelioma, about the size of the nail of my little finger, on the left tonsillar lingual fold. It was freely movable on the deep tissues and there were no enlarged lymphatic glands. I was wintering in Jamaica. I left for New York at once, and placed myself under the care of a surgeon who has certainly had as much experience with this class of case as anyone in the world. More kindly, skilful, and generous treatment no one could possibly have received. The diagnosis was confirmed by a microscopical examination of the edge of the ulcer.

RADIOLOGICAL REPORT

Treatment began the day I arrived—that is, on February 22. From that date until March 12 I received x-ray treatment, amounting to a total of 3,540 r units, given during fourteen exposures. This was supplemented by radium therapy, ten radon seeds being inserted in the left anterior tonsillar pillar on March 8 and fifteen seeds in the left neck on April 1.

March 8.—First lot of ten radon seeds inserted around ulcer from inside of mouth.

April 1.—Under novocain. The left intercarotid lymphatic gland and the next gland to it were excised and the second lot of fifteen radon seeds inserted through the wound deep to the ulcer. The pathologist's report: "No growth; inflammatory only."

April 6.—Stitches removed, wound healed by first intention.

April 21.—Sailed for England.

THE PATIENT'S POINT OF VIEW

February 22.—I am 6 ft. 1 in., weight 10½ st. without clothes, aged 70. Could play a daily round of eighteen holes at golf or drive a car all day without being tired.

February 26.—After the fourth exposure to x rays, for the first time did not feel quite so well.

March 1.—After the sixth exposure to x rays I felt very slack; no appetite; coppery taste in mouth.

March 8.—Insertion of radon seeds hurt a bit. The last one very painful—as bad as extraction of a molar tooth. Felt sick and faint; pain, numbness, and a tingling in front part of left side of tongue. Could not open my mouth wider than to just admit a finger.

March 12.—Last exposure to x rays. My skin over the left side of neck and jaw bronzed, hot, and sore. Throat at site of growth slight superficial ulceration, no hard edges.

All this time my throat and nose were daily sprayed thoroughly with mild antiseptics. This has continued until the present time.

March 19.—Everything seemed worse, and I felt rotten.

April 1.—No pain from operation or afterwards.

April 6.—All stitches out. Wound had absolutely healed by first intention. No pain about scar.

April 21.—Sailed for England. Not feeling too good. Weight 9 st.

I improved in general health, but was never free from marked discomfort in the left side of my throat and tongue. Weight 9 st. 3 lb. on July 22.

About this date severe pain started in all three divisions of the fifth nerve on the left side and pain and spasm in the left masseter and pterygoid muscles. Eating, drinking, smoking, and speaking all increased the pain, and became almost impossible. There was an ulcer with a wash-leather slough on it about the size of a penny piece where the original growth had been. Cachets of aspirin and codeine relieved the pain a bit. I could only sleep on my right side, and pressure on the right posterior thoracic nerve caused paralysis of the right serratus magnus and "wing" scapula—I still have it. I went steadily downhill. Life was most certainly not worth living. On November 7 my weight was 8 st. About the middle of November things got a little better; there was less severe pain and more appetite, and since then, to February 4, 1938, my weight has increased to 8 st. 8 lb.

It is interesting but not amusing to watch one's heavily irradiated tissues, practically unchanging month after month, wondering whether they will recover or die, knowing that the only thing one can do is to keep the mouth clean and the general health and nutrition as good as possible. I have not been dressed or out of my house and garden for the last six months. I can only walk about two hundred yards, and am a bent and feeble old man. I suppose I shall ultimately get better; but one asks oneself, "Is it good enough?" For me, definitely not. The surgical part of my case was trivial and painless. I would not wish my worst enemy the prolonged hell I have been through with radium neuritis and myalgia for over six months. La Rochefoucauld was right when he said: "It is a grievous illness to preserve one's health by a regimen too strict."

This account of my own case is a plea for a very careful consideration of all the factors before deciding which is the most suitable method of treatment. For an old man with an early growth to have an adequate surgical operation only would be well worth the possible extra risk of recurrence. On the other hand, though a young man might withstand radium better, if he is unfit for work for a year afterwards how does he earn his daily bread? The resistance of tissues to radium emanations is still a doubtful quantity, and the intensive research on this subject which is being carried out should be generously supported. This to my mind is even more important than buying more radium and using it in cases for which it may not be the most suitable form of treatment.

PERCY FURNIVALL, F.R.C.S.,

Consulting Surgeon to the London Hospital.

not been sacrificed in spite of the extra space needed to bring the book up to date.

Recent advances in the field of bacteriology have called for extensive revision and rearrangement in many of the chapters, and much new material has been added, including descriptions of such organisms as those of bovine pleuro-pneumonia and agalactia, *Bacterium monocytogenes* and *Bacillus necrophorus*. The inclusion of pseudo-rabies, lymphocytic chorio-meningitis, rift valley fever, poradenitis, the common cold, and influenza has led to a considerable enlargement of the section dealing with filterable viruses. This opens with an introductory chapter in which the characteristics of viruses in general are discussed and the technique of virus work is described. The methods available for the staining of elementary bodies are so numerous that one would neither expect nor hope to find them all included in a book of this nature: the authors have confined themselves to a few methods which they know to be satisfactory and reliable. The directions for the cultivation of viruses are not always as clear as they might be; particularly is this so in the description of the method utilizing the chorio-allantoic membrane of the developing hen's egg. The chapters on the pathogenic protozoa and the pathogenic fungi have been retained, and a short appendix on the bacterial flora of the normal skin and mucous membranes has been added.

The extensive revision and additions throughout the text have inevitably led to an increase in size, and although it may appear to be rather large for the undergraduate medical student in view of the relatively short time allocated to the subject in the medical curriculum, the book in its new form can be recommended as a concise and up-to-date work on the subject.

Notes on Books

Die Operation in der Sprechstunde, by Dr. RICHARD GOLDHARN (Leipzig: Georg Thieme, R.M. 6.80), is an attractive little volume dealing with the type of surgery which a practitioner may be called upon to perform in his consulting room. It consists of some 180 pages of text, an index, and sixty-eight illustrations, which are very clearly drawn and demonstrate well the points made in the text. The treatment of wounds, tracheotomy, lumbar and cisternal puncture, teeth extraction, and tonsillectomy may be cited as examples of the surgical procedures, all of which are described concisely and clearly. Descriptions and illustrations of some useful devices not often referred to in students' textbooks are included, such as a method of extracting a pin from the urethra so as to produce minimal damage and the use of Michel clips for controlling bleeding from a scalp wound, while the accounts of the treatment of urinary obstruction, finger and hand infections, and of peri-anal abscesses add to the value of the book. The convenient size of this volume, its large and clear print on glossy paper and particularly graphic illustrations make it attractive, and it should have a wide appeal to practitioners and even also to hospital residents. It might profitably be translated into English.

The object of the *Municipal Year Book* is to give succinct information about the various developments of local government administration, first as a permanent record of events, and secondly in order to facilitate reference for everyday use by all who are concerned directly or indirectly with the civic services. The issue for 1938, the fortieth year of publication, is a large and well-produced volume of 1,650 pages, divided into fifty sections, with full general indexes and a handy thumb index to the twelve main divisions. The whole material has been

thoroughly revised, and the editor says that fully 80 per cent. has been rewritten. The past year was a fruitful one in the matter of law cases affecting local government, and all the important cases and decisions are reviewed. The Minister of Health contributes a glowing preface to the latest edition of this invaluable encyclopaedia of local government facts and figures. It is published at 30s. by the Municipal Journal, Ltd., 3 and 4, Clement's Inn, Strand, London, W.C.2.

The third edition of *The Sanitary Inspector's Handbook*, by H. H. CLAY, has been enlarged by nearly 100 pages owing to the rewriting of most of the references to law throughout the book rendered necessary by the coming into operation of the Public Health Act of 1936, the provisions of which are specifically considered in certain chapters. Additional new technical information has also been incorporated, and the book deals effectively with the great diversity of duties now laid on the sanitary inspector. A summary of the law in Great Britain so far as it concerns the sanitary inspector is inserted at the beginning of each chapter, facilitating quick reference and ensuring lucidity. Nearly 100 illustrations in the form of diagrams add to the value of the book, and a glossary of building terms, memoranda, and an adequate index are supplied. The present edition is a worthy successor to its popular predecessors. It is published by H. K. Lewis and Co. at 16s. 6d.

An important addition has been made in the tenth edition of BOLLES LEE'S well-known handbook *The Microtome's Vade-Mecum*. Dr. D. G. Catcheside having contributed a new section on plant technique. There are also new chapters on frozen section technique and vital staining. All the sections have been carefully revised and brought up to date. The original author, Arthur Bolles Lee, was at one time a medical student in London, but he did not complete the course, going out to Neuchâtel, where he devoted himself to the methods of microscopical anatomy. In the first editions of his *Vade-Mecum* no procedure was included which he had not personally employed, but the scope of the subject extended so widely that later on this selection became impossible: several chapters in this edition—for example, those on invertebrate embryology and nerve-endings—still stand as the original author left them at his death in 1928 when the ninth edition was just going to press. The present authors are J. Bronté Gatenby of Trinity College, Dublin, and Theophilus Painter of Texas University. The publishers are J. and A. Churchill and the price is 30s.

Préparations and Appliances

FERRAEMIA TABLETS

Ferraemia brand tablets (Messrs. Wilcox, Jozeau and Co., North Circular Road, N.W.2) are chocolate-coated tablets each of which contains $2\frac{1}{2}$ grains of excised ferrous sulphate together with small quantities of copper and manganese salts and 2 grains of dried yeast. The preparation is recommended for hypochromic, nutritional, and secondary anaemias, and as an adjuvant to liver therapy in pernicious anaemia.

MAGNESIUM TRISILICATE PREPARATION

"Trisomin" (Eli Lilly and Co.) is a preparation of magnesium trisilicate. Dr. Mutch drew attention in these columns to the useful antacid properties of this salt, which adsorbs and inactivates hydrochloric acid. The adsorbent action of the hydrated silicate gel formed in the gut by magnesium trisilicate indicates that it should be valuable in the treatment of diarrhoeas due either to food poisoning or to infection with dysenteric organisms.

chronaxia of the peripheral elements of the nervous system is controlled by, and therefore is subordinate to, that of the central elements in health, and that in disease this subordination is disturbed. A study of the chronaxia of the various parts will thus help to localize the lesion. Similarly, such studies throw light on the action of certain drugs, especially of anaesthetics, and on the effects of the toxins of various bacteria and viruses.

Much work has been done on the variations of chronaxias and their subordination at various levels of the nervous system under normal and pathological conditions, and on influences brought to bear by interaction of the central and the vegetative nervous system and by various circulatory nutritive and endocrine changes. Though many of these observations are confusing and contradictory, they seem to point to a physicochemical explanation of the phenomena and to throw light on the recent theories of chemical transmission of nervous impulses.

In the last section of the book Dr. Mollaret describes his own studies on chronaxia and subordination in relation to posture. As Dr. Lapique says in the preface, this work is an invaluable survey of all that has been done in the field of chronaxia up to the present time.

TREATMENT OF PNEUMONIA

The Management of the Pneumonias. By Jesse G. M. Bullowa, B.A., M.D. (Pp. 508; 142 figures; appendix. 27s. 6d. net.) London, New York, Toronto: Oxford University Press. 1937.

Professor Bullowa's book, based largely on the studies carried on in the Littauer Pneumonia Research Laboratory and the wards of Harlem Hospital, New York, is a very detailed exposition of the subject. It is copiously illustrated by graphs, curves, and charts in the American manner. Unless it is borne in mind that this book is the result of a planned research the reader may feel overwhelmed with the mass of statistics and mathematical calculations, and he may despair of ever being able to treat a case of pneumonia again. But once the nature of the book is realized he will find much shrewd observation and helpful guidance. He may, however, feel that if we in this country tend to undertreat our cases, there may be a tendency to overtreatment on the other side of the Atlantic, and may demur from the statement (p. 38) that the pneumonia patient is never too ill to be examined.

From the wealth of material we may pick out some of the points that interested us. The author finds that women, though more lightly clad than men, are less liable to pneumonia, which emphasizes the protective value of a quickly reacting vasomotor system in the skin. He stresses the dangers of dehydration, and regards euphoria as a very bad sign. Horsfall and Goodner are quoted (p. 75) on the importance of certain lipoids in assisting and in interfering with the protective effect of serum treatment; lecithin assisting and cholesterol interfering with it. We are rather surprised to learn (p. 169) that the metabolic requirements of a pneumonia patient may be 3,500-4,500 calories daily, and that 7.2 per cent. should be added to this for every rise of a degree in temperature. For a fever of short duration we should not have thought inanition a real danger, nor should we have anticipated that such a patient could assimilate so much nourishment. The author is strongly opposed to morphine in pneumonia, mentioning (p. 180) that out of fourteen delirious patients given morphine thirteen died. He disbelieves in the value of quinine derivatives such as optochin, and mentions the risk of their causing amblyopia. As to prontosil, he

does not think that its value for bacteraemic cases of pneumonia is as yet proven.

There is an interesting section on acute pulmonary oedema (p. 188). Professor Bullowa considers that treatment should be directed to overcoming the increased capillary pressure by (1) reduction of the circulatory fluid by limiting fluid intake and by venous tourniquets; (2) abstraction of fluid from the tissue spaces by the intravenous injection of 100 c.cm. of 50 per cent. sucrose solution, which, though acting more slowly than glucose, has a more prolonged effect; (3) treatment of anoxia by oxygen administration and increasing the depth of respiration by giving it under pressure, which also breaks up the foam bubbles in the atria of the alveoli; (4) counter-irritation.

Good radiographs of the chest illustrate the section on radiological diagnosis; and methods of oxygen administration and of serum treatment are dealt with comprehensively. But enough has been said to show what a full study of the subject has been made by the author.

IRON METABOLISM

Das Serumeisen und die Eisenmangelkrankheit (Pathogenese. Symptomatologie und Therapie). By Ludwig Heilmeyer and Kurt Plötner. (Pp. 92; 22 figures. RM. 6.) Jena: G. Fischer. 1937.

In this monograph on serum iron and iron deficiency Drs. Heilmeyer and Plötner give a useful review of an important subject. The iron content of serum is only about 1 mg. per litre and hence the total body content is less than 4 mg. This tiny quantity is, however, important, because it represents material in transport, and after secondary anaemia due to haemorrhage it may fall to 20 per cent. of the normal. The authors calculate that in such conditions the serum iron is restored more slowly than the haemoglobin, and only returns to normal when the iron depots of the body are refilled. The monograph closes with an interesting discussion on the value of various forms of iron therapy. Measurement of changes in serum iron permit the demonstration within a few hours of the fact that ferrous salts of iron are absorbed, whilst ferric compounds are not. The authors draw attention to the great value of intravenous injections of the combination of iron and ascorbic acid. Injections of 0.2-0.3 gramme of this compound produce better effects on the haemoglobin content than does administration of 6-10 grammes of ferrum reductum by mouth.

The monograph gives a very clear account of an interesting new method in chemical pathology which should do much to clarify our knowledge of the difficult subject of iron metabolism.

"MUIR AND RITCHIE"

Muir and Ritchie's Manual of Bacteriology. Revised by Carl H. Browning, M.D., LL.D., D.P.H., F.R.S., and Thomas J. Mackie, M.D., D.P.H. Tenth edition. (Pp. 996; 212 figures, 6 coloured plates. 20s. net.) London: Humphrey Milford, Oxford University Press. 1937.

In spite of the appearance of new textbooks of bacteriology the manual of Muir and Ritchie continues to hold its position as one of the standard works in this field. The tenth edition, which has been revised by Professors Browning and Mackie, retains those features which have been distinctive in previous editions. The new illustrations conform to the high standard one expects from this textbook, and the treatment of the pathological aspect of the naturally occurring or experimentally produced infections, which has always been an attractive feature, has

BRITISH MEDICAL JOURNAL

LONDON

SATURDAY FEBRUARY 26 1938

THE TRANSPORT OF IRON

In a recent leading article in these columns¹ we discussed the problem of the storage of iron, and attention may now profitably be turned to the transport of iron, a subject on which important work has been carried out during the past year. Heilmeyer and Plötner² have studied the level of iron in the serum by a photometric method, using as indicator *o*-phenanthroline, which has the advantages over dipyriddy that it gives a sharper reading, is cheaper, and keeps better. The values, which are very constant in health, are: for men 122–130 γ per cent. and for women 85–93 γ per cent.* Thus the serum iron in men and women differs by 30 per cent. and the difference is statistically significant. It cannot be explained on the ground that women are not so full-blooded as men, for their haemoglobin and red cells differ by only 10 to 15 per cent., and in general there is no very close correlation between serum iron and blood haemoglobin in healthy people. The difference is attributed to the effects of menstruation (all the women examined appear to have been in the reproductive epoch), for loss of blood usually depresses the level of iron in the serum. In pregnancy the serum iron varies over a very wide range, and no general statement can be made about it. The serum iron is low in idiopathic hypochromic anaemia and in chronic haemorrhagic anaemia. It may rise above the normal level for a short time after a small haemorrhage, but it falls after a large haemorrhage, even below 20 γ per cent. Such a fall is not seen when bleeding occurs in aplastic anaemia, and reasons are given for ascribing it to increased consumption of iron by the blood-forming organs, which manifest increased activity after acute loss of blood. The iron absorbed from the food or released from previous stores is insufficient to meet the needs of haemopoiesis, and the sharp fall in the level of the serum iron is the expression of a transient relative iron deficiency and an indication for prescribing it. The serum iron rises during iron therapy but does not regain the normal level until anaemia is repaired; it is normal or high normal in pernicious anaemia, it falls during liver treatment, and only returns to normal again when the anaemia is cured. Very high values are found

in haemolytic anaemia. The serum iron is much decreased in infections, and this decrease persists so long as the infection is active. A parallel is drawn between this finding and the diminution of vitamin C in the body fluids in infections, and it is suggested that both are due to the heightened metabolism of fever and the greater need for the oxidizing-reducing properties of iron and vitamin C.

These observations have been confirmed in detail by Moore and co-workers.³ They believe that the amount of iron present in the peripheral blood is influenced by the amount of iron being absorbed from the gastro-intestinal tract, the extent and adequacy of the iron reserves of the body, and the ability of the bone marrow to utilize iron in the manufacture of haemoglobin. It is also influenced by the rate of haemoglobin synthesis, the extent of haemolysis taking place in the spleen and other tissues, and the equilibrium which exists between these two processes. It would be a mistake, however, to assume that iron is carried only in the plasma, and such a conclusion is negated by the studies of Josephs and Winocur.⁴ They have been working with little children and have had to confine their studies to whole blood. The iron of whole blood (approximately 50 mg. per cent.) can be regarded as the same as the corpuscular iron, as the upper limit of the serum iron is only about 0.5 mg. per cent. Normally the total iron of the blood corresponds with that calculated from haemoglobin within a limit of ± 6 mg. per cent. If whole blood or a solution of haemoglobin is treated with hydrochloric acid about 5 per cent. of the total iron present becomes ionized, so that it will pass through a semipermeable membrane. The proportion of "easily split-off" blood iron is relatively constant; it does, however, undergo variations, and these have no obvious relation to either the amount of iron in the plasma or the concentration of haemoglobin. It is suggested that haemoglobin may not be a uniform substance but may consist of two different haemochromogens which differ in respect of the firmness of their combination with iron, but the exact meaning of the easily split-off iron and its functions remain to be defined. All three groups of workers appear to agree on these two points: that normally the amount of iron in the corpuscles can be completely accounted for by their haemoglobin content; and that all samples of human haemoglobin probably contain the same percentage of iron, even though the amount of iron which can be easily split off by acid may vary under different physiological and pathological conditions. Josephs and Winocur compared the amount of iron in the blood of sick children with the amount

* The symbol gamma (γ) signifies 1/1,000 milligramme.

UNDULANT FEVER IN MALTA

BY

J. E. H. GATT, M.D., D.P.H., D.T.M.

As a result of the report of a Royal Commission which investigated undulant fever in Malta in 1904 to 1906, both naval and military authorities forbade the use of fresh milk of any sort by the marine troops and their families. In a few months a morbidity from this cause as high as 37.6 per cent. among soldiers and 28.55 per cent. among sailors and their families disappeared altogether with the compulsory substitution of tinned for fresh milk. The occasional sporadic cases were invariably traced to the consumption of fresh milk in unauthorized inns or restaurants. Among the civil population the incidence of the disease increased till in 1934 as many as 7.25 per 1,000 of the population were infected. The public health department periodically advised that milk should be boiled, but owing to a prejudice against cooked milk, and the fear of adulteration unless the goat (the principal and often the only source) was milked on the doorstep of the householder, only a very small proportion of the inhabitants paid heed to the warning. Tinned milk, however, rose rapidly in favour among the lower classes as an infant food. Many cheap sweetened brands flooded the market, to the obvious detriment of child welfare and with a consequent increase in the infant mortality. Cases of undulant fever among the military and naval population dropped from 245 in 1905 to 12 in 1907. The figures for the civil population for the same years were 798 and 457 respectively. For the last decade, 1926 to 1935 inclusive, the returns for the civil population have been as follows:

Year	Cases Notified	Deaths
1926	586	27
1927	702	28
1928	971	42
1929	1,288	61
1930	1,471	85
1931	1,345	72
1932	1,465	82
1933	1,713	67
1934	1,909	88
1935	1,310	80
1936	873	52
1937 (January to October)	677	—

The highest incidence invariably occurred during the dry months of the year—that is, from May to September or October. Thus for 1937:

Months	Jan.	Feb.	Mar.	Apr.	May	June	July	Aug.	Sept.	Oct.
Notified cases..	36	48	66	70	93	109	146	133	114	98

Epidemiology

Undulant fever is endemic throughout the Mediterranean basin and all the countries adjoining it. Since the identification of *Brucella abortus* in 1921 and the discovery of its close relationship to *Brucella melitensis*, it may well be described as a world-wide disease. In Great Britain the infection was first reported by Sir Weldon Dalrymple-Champneys in 1929. Other reports followed from Scotland, Wales, and Ireland; recently reports have come from Russia, the infection there being traced to dung briquettes imported as fuel. In France at least fifteen Departments, chiefly in the south and south-east, are seriously affected. In the United States of America thirty-two out of the forty-eight States are infected, and the infection is progressing. Infection has been invariably traced to raw milk or to direct contact with the discharges of infected animals.

Clinical Points

Undulant fever due to *Brucella melitensis* infection is characterized by waves of fever of varying duration with intervening periods of apyrexia, often of very long dura-

tion, the total course varying from an average of six months to three years or longer. There is profuse diaphoresis, progressive anaemia, and later excruciating pains in bones, joints, and along the course of nerves, due to chronic inflammation of aponeuroses, ligaments, and nerve sheaths. The spleen is always enlarged but not usually tender. Secondary infections, especially tuberculous and staphylococcal, are common. The most usual blood picture is a leucocytosis, as many as 50 per cent. of the white cells being mononuclears. A moderate eosinophilia may also be met with. In protracted cases the haemoglobin is considerably reduced, and a profound anaemia results which is the cause of a protracted convalescence. Blood culture is positive in as many as 98 per cent. of cases, and the *Brucella melitensis* may be isolated even during apyretic intervals. The not infrequent presence of organisms in the urine of patients at once raises the problem of human carriers.

Treatment and Prophylaxis

Vaccines appear to offer the only hope of successful treatment at present, but largely owing to the profound anaemia and allergic states great care and patience have to be exercised in the selection of cases suitable for vaccine therapy. Prontosil has been tried in America without success.

As to prophylaxis, the scheme in Malta for pasteurizing goats' milk and for the simultaneous control of the whole milk industry of the islands, which will result in the early disappearance of all goats and sheep from the public thoroughfares, is now well in hand, and it is hoped that the system will begin to operate early in 1938. But unless all the herds are systematically examined with a view to eliminating all infected beasts, which certainly exceed 15 per cent., the improvement must be slow. Undulant fever has been successfully stamped out in Port Said by destroying all infected goats; the same method of attack is being advocated and carried out in Sweden to deal with contagious abortion in cattle. If the destruction of a considerable proportion of the existing herds in the Maltese Islands is not feasible, at least immediate segregation should be insisted upon, and the goats so segregated on Government farms may supply the material for further study at the newly opened research station, where it is hoped to evolve a suitable goat vaccine. An emulsion of *Br. abortus* in normal saline (100,000,000 organisms per c.cm.) is used intradermally in France for the detection of infected animals, 0.7 c.cm. for cattle and 0.3 c.cm. for sheep and goats being injected into the folds of the skin around the anus. A positive reaction is indicated in from two to three days by a tense oedema which lasts for five to six days. A preventive vaccine with live, non-virulent organisms is also used for infected animals. This prevents abortion, and thus reduces the chances of human infection from this source.

While compulsory pasteurization is not at present contemplated in Malta, reliance is being placed more on the effect of healthy propaganda, with a view to educating the public to the value of a clean and safe milk. Distribution in properly sealed bottles and cartons will be from suitable centres, so that the supply will be within easy reach of the consumers all over the island.

A new edition of the pamphlet *Careers for Secondary School Girls* is now published in a more compact form as one of the series prepared by arrangement between the Incorporated Association of Headmasters and Headmistresses and the Ministry of Labour. Most of the usual careers for girls are listed, including some still in the pioneer stage. In each section there is a brief note of the qualifications required (with particular reference to the need for the school leaving certificate); the nature, length, and cost of training and the prospects, including starting salaries. The pamphlet is on sale at H.M. Stationery Office or through any bookseller, price 6d. (7d. post free).

blown off when starting a fresh cylinder. Mechanical ignition may occur in reducing valves, and is avoided by turning on the cylinder valve very slowly.

An electrically conducting rubber has recently been developed by the Dunlop Rubber Company, and the use of such a material promises to provide an effective method of reducing dangerous electrification in anaesthetic and other equipment. It can be made with varying degrees of resistivity, while retaining the ordinary properties of rubber. It is important that the resistance should not be too low, not under 100,000 ohms, otherwise there would be danger should the rubber come into contact with a source of electrical supply. In this case the power absorbed might be enough to cause ignition in a short time, without the current being large enough to melt an ordinary circuit fuse. A corrugated breathing tube of this rubber, about 1 m. long, 30 mm. diameter, and 1 mm. thick, had a resistance between the ends of about 1 megohm. Its properties were not impaired by such tests as prolonged exposure to the vapours of ether and chloroform, soaking in lysol, and boiling. A breathing bag of the usual type showed a resistance between the ends of about 0.5 megohm. Besides the above-mentioned frictional electricity there are many possibilities of danger from ordinary articles of electrical equipment. These can only be avoided by the strictest care in design, construction, and use.

TRAUMA OF THE HEART

The effects of trauma on the heart, leaving aside penetrating wounds, is one of the most controversial of subjects and one that has been relatively neglected, though it is of great importance, especially from the medico-legal point of view. Elsewhere in this issue (p. 433) Dr. Hugh Barber expresses the view that violence to the chest wall and the strain of great muscular effort are responsible for a variety of cardiac lesions, though perhaps many will not be able to accept his belief that "more cases of heart disability following trauma are overlooked than are diagnosed by mistake." Direct violence to the chest wall may be followed by arrhythmias, but perhaps the sequence is too infrequent to be of great significance; or by angina pectoris, and it is not difficult to believe that angina could first appear in a subject predisposed by coronary disease after an event which altered both the excitability of the nervous system and the general physical condition. The possibility of contusion of the myocardium as a result of trauma without external wound seems very real, and, as has been suggested, might be revealed by the electrocardiogram. Dr. Barber's second category, the indirect, traumatic effects on the heart of strain, is the more interesting and even more difficult of proof. There is no question at all that the aortic valve can be ruptured by great muscular effort and many cases have been

reported, but rupture of the normal valve or of the normal aortic wall by strain is considered impossible by some, since experimentally enormous pressures are required to break these structures. The problem is difficult, first, because absence of disease cannot be presumed from an absence of symptoms or signs prior to the rupture,¹ and, secondly, in cases where post-mortem examination is possible the interpretation of the pathological changes is difficult because vegetations are likely to form rapidly at the site of the tear. In a series of cases of rupture of the aorta Klotz and Simpson² found microscopical lesions in the media, though little or no defect was visible on superficial examination. Functional impairment of the myocardium through a sudden strain, or the more prolonged effort of athletics, the heart being previously healthy, is likewise hard to prove. The orthodox view to-day is that this does not occur, though Dr. Barber is inclined to believe that it may. Complaint of dyspnoea, palpitation, and precordial pain and the finding of tachycardia in a working man after an accident is extremely common; these, however, are usually the expression of an anxiety state (often associated with the question of compensation) and not at all indicative of cardiac disease. The forcible and rapid apex beat may lead to a diagnosis of acute dilatation; but fluoroscopy will probably show a heart of normal size. Such symptoms may abruptly disappear with the settlement of a claim. On the other hand, strain may very seriously and irreparably damage a myocardium which is the seat of chronic disease or one affected by an acute infection, and the best evidence for presence or absence of these conditions can, as Dr. Barber points out, usually be obtained from an accurate and detailed history.

MINERAL CONTENT OF THE BRAIN

Quantitative estimations of the inorganic mineral constituents of the brain, such as that of Tingey,³ though of value for determining the relative amounts of these substances in different areas of the brain and in various abnormal conditions, do not give precise information regarding the localization of mineral salts within the brain tissues. The method of micro-incineration, modified by Scott, enabled Alexander and Myerson⁴ to undertake an elaborate investigation into the distribution of mineral salts in the cellular architecture of the brain. Briefly, the method consists in exposing very thin paraffin sections of brain tissue to temperatures gradually rising to 650° C., whereby the organic constituents are completely consumed, leaving the mineral constituents only on the slide. These slides are studied at low power by oblique transillumination and at high power by dark-ground illumination, and by comparison with contiguous sections which have been stained with ordinary tissue stains the mineral constituents can be accurately localized. The particular minerals which can be identified with certainty

of haemoglobin determined by oxygen capacity and colorimetry, and they found that at certain times the corpuscles contain more iron than can be accounted for by their haemoglobin content. These times are the first two months of life; during iron therapy; and during infections. The extra iron in these conditions exists in a so-called organic form, and its significance is not clear. It may represent a more primitive form of haemoglobin having a higher content of iron than is normally present, or it may be an iron-containing organic compound which does not carry oxygen but is an intermediate product in the formation and breakdown of haemoglobin.

If the results of Josephs and Winocur are confirmed—and it is obviously desirable that they should be repeated on adults—we must conclude that iron is transported in a relatively simple form in the plasma and in organic form in the corpuscles. The two systems do not run parallel, for in infections the serum iron is low and the non-haemoglobin iron of the corpuscles is high. Further analysis may provide data which will lead to a better understanding of the closely linked processes of breakdown of blood and formation of blood, which maintain the concentration of haemoglobin in the blood with such constancy in health and which restore it to the normal level with such surety when it has been reduced by haemorrhage, malnutrition, or disease.

RISKS OF EXPLOSION IN ANAESTHESIA

A paper read on Thursday by Mr. E. H. Rayner, Sc.D., before the Institution of Electrical Engineers, on risks of explosion in anaesthesia, describes the results of the investigations carried out at the National Physical Laboratory on behalf of the Joint Anaesthetics Committee of the Medical Research Council and the Royal Society of Medicine, which were referred to in these columns last year.¹ Twenty hospitals in this country were visited and one abroad; the matter was discussed with administrative, medical, and nursing staffs; conferences were held with hospital authorities; and inquiries were made in America, where climatic and other differences have given a greater experience than has been obtainable here. Dr. Rayner describes only the "bubble-bottle" variety of apparatus, and does not mention the now widely used M'Kesson and dry flow-meter types, which might conceivably be more prone to the development of internal static electrification. He appears disinclined to accept the American view that charges developed in the anaesthetic apparatus

itself are often responsible for explosions, but points out that much experimental work on a variety of equipments and under various conditions would be required to estimate the importance of this source of electrification. It has been recognized for some time that electrical charges can readily be produced by the movement of warm dry blankets or sheets on trolleys or similar articles mounted on rubber-tired and therefore insulating wheels, and particularly if they have rubber sheets or mattresses. Dr. Rayner was often able to produce in this way sparks of 0.5 mm. upwards; the longest being 15 mm. He considers that a discharge capable of being felt with the finger indicates a dangerous condition, and draws particular attention to the danger of ether-oxygen mixtures, owing to their wide range of explosibility and ease of ignition at low temperatures, perhaps as low as 200° C. In several hospitals the electrical resistance of the ordinary granolithic type of floor was measured, and this was demonstrated to be low enough to justify the use of the trailing chain as a safety measure, though the latter is of no value upon floors of rubber or cork carpet, both of which may act as good insulators. Practical tests on both a granolithic and a tile floor have demonstrated that no electrification could be produced when the chain was in use, though without it a spark and shock were readily obtained. The chain need only be a light one, with links of 1/2 to 1/4 inch, and about 3 inches should trail on the floor.

Electrification by friction is much facilitated by a dry atmosphere, and experimental evidence from America shows that there is very little danger if the relative humidity, which may need to be artificially maintained, is not allowed to fall below 65 per cent. Very cold, dry weather produces the worst conditions, for the outside air contains little moisture, and when it is heated the relative humidity becomes low. Air-conditioning may produce the same effect, for if the washing water is colder than the air it may withdraw moisture from it, thus causing a low relative humidity on reheating. A point worthy of note, though it may be only coincidence, is that air-conditioning plant is installed in two hospitals in this country which have had trouble with electrification and anaesthetic ignition. Although experimentally electrification may be readily caused by particles of fluid or dust in a stream of gas at high velocity, Dr. Rayner does not think that this is likely to happen under the conditions in which anaesthetic apparatus is employed, but he does recommend that oxygen cylinders should be stored and used valve uppermost in order to avoid trouble from possible internal condensation, and that a little should be

¹ *British Medical Journal*, 1937, 2, 383.

treated with intramuscular injections of atebirin musonate (three injections of 0.3 gramme) the immediate curative effects were satisfactory, febrile symptoms and parasites in the peripheral blood disappearing more rapidly than in controls treated with quinine or atebirin. Two cases, however, showed alarming though transitory nervous symptoms: as pointed out, the usually recommended dose was exceeded. Experiments on estates in relation to medicinal prophylaxis were carried out by the Institute of Medical Research in collaboration with the Malaria Commission of the League of Nations. In three groups receiving respectively 0.2 gramme atebirin on two consecutive days each week, 0.4 gramme quinine, and no prophylactic drug, both atebirin and quinine after a few months were equally effective, but quinine took longer to control the malaria. With atebirin, attacks of malaria ceased almost entirely within a fortnight of the beginning of treatment. In the control group the incidence remained high. When prophylactic issue was stopped numerous attacks of malaria occurred, three-quarters of which were in the two hitherto protected groups. Among other work carried out there has been investigation of the cost of oiling and drainage, anopheline survey of the Selangor coast area where *Anopheles sundanicus* (Iudlowi) is prevalent, and measures against malaria in this area: also experiments on the deterioration of open cement drains and experiments with larvicides. In the latter connexion two new proprietary preparations were found less effective than the usual (M.D.B.) mixture employed. Experiments on the use of shade in larval control (*A. maculatus*) were also initiated. *Crotalaria*, *Tephrosia*, and *Lantana* grew satisfactorily but did not give a dense enough foliage. The majority of the *Cassia* died, growth of *Duranta* was poor, and that of *Bamboo* variable. At the suggestion of the Agricultural Department a thickly growing creeper, *Mikania scandens*, has been planted to cover the *Lantana*, and results to date are promising.

URINARY ANTISEPSIS

It is now becoming recognized that sulphanilamide, in addition to its other remarkable actions, is the most dependable of all urinary antiseptics. Its advantages over mandelic acid are that it acts even more rapidly, is regularly excreted, does not demand an acidification of the urine which in some patients is difficult to attain, and is less unpalatable and cheaper. In commenting recently on a study of its action published in this country¹ which contained the statement that the effective pH range in urine of sulphanilamide is from 5.2 to 6.8, we drew attention to a recent paper by Helmholz, who asserted that the drug is more bactericidal in an alkaline urine. This observation is now amplified by Helmholz and Osterberg,² who have carried out a more elaborate series of experiments on the bactericidal action of different concentrations of sulphanilamide in urine of different reactions, employing several different bacteria. Their results may be summarized in the statement that,

whereas concentrations of sulphanilamide of 40 mg. per 100 c.cm. or more are necessary for effective action in acid urine (pH 6.2), only half this amount need be excreted to exert the same effect in urine of pH 7.3 to 7.8. From this it would appear that to secure maximum effect, perhaps with only a moderate dose, steps should be taken also to maintain an alkaline urinary reaction. A supreme merit of this form of treatment is that it succeeds in *B. proteus* infections, against which hexamine and mandelic acid are powerless, owing to the urea-splitting action of this organism and the consequent impossibility of rendering the urine acid enough for these two drugs to act. Apparently only one organism commonly found in the urinary tract, *Streptococcus faecalis*, is completely resistant to sulphanilamide. These authors also describe new experiments on the bactericidal action of different previous conclusion, only the free form of sulphanilamide, and not the conjugated, acts bactericidally in the urine. There is therefore as yet no explanation of their observation that the naturally excreted drug is more active *in vitro* than the same quantity added artificially to urine.

PROPHYLAXIS AGAINST WHOOPING-COUGH

Few who have followed the literature on whooping-cough* will be convinced that any vaccine at present available modifies with certainty the course of pertussis after the cough has developed. The prospect of prophylaxis is less discouraging, and confident claims are still being made. Kendrick and Eldering¹ reported a 6 per cent. incidence among the vaccinated and 75 per cent. in the unvaccinated, the groups containing 700 to 800 children. Sauer² has reviewed a number of clinical observations showing a high degree of protection following the injection into children of the large volume of 10 c.cm. of vaccine in divided doses. On the other hand Shaw,³ in the same journal, states that the results of field tests recording the effectiveness of vaccines are at present conflicting, and that though there is evidence that some protection is conferred other evidence denies this: there is consequently little justification at present for the advocacy of universal immunization. According to Brooks and Miller⁴ it still remains to be proved that it is possible to immunize actively against whooping-cough. Because of the equivocal results of prophylactic vaccination, and because of the existing differences of opinion, the Department of Health in the City of New York⁵ has now decided to restrict the issue of vaccine to two centres for carefully controlled experiments. Paediatricians will still feel, with Topley and Wilson, that the ultimate court of reference must be the results in vaccinated persons when exposed to natural infection. In their efforts to produce better vaccine which will not require a tedious series of doses immunologists have used agglutination, complement deviation, and the "opsonocytaphagic" tests. The relation between these various tests is not clear.

by this method are iron, calcium, and silica, and it is claimed that in addition to its value for the localization of mineral salts in the nervous system this method surpasses in accuracy all known staining reactions for the demonstration of iron. The normal adult brain when studied in this way is seen to contain mineral salts in the pyramidal cells of the cerebral cortex, the Purkinje cells of the cerebellum, and the anterior horn cells of the spinal cord. These salts consist of calcium, a little iron oxide, and certain other water-soluble minerals, and are confined to the cytoplasm and the nucleolus. The nuclei contain practically no minerals, nor do the neurofibrils, the axone hillock or the axone itself. In the new-born infant the distribution of mineral salts is reversed; most of the minerals are concentrated in the nuclei of the ganglion cells and the cytoplasm contains very little. The ependyma of the ventricles contains much mineral ash, and in granular ependymitis there is a large increase in its mineral content. The cerebral blood vessels are rich in minerals, which are found chiefly in the fibrous coat; the muscle, the intima, and the elastic tissue giving no mineral residue. Many diseases of the brain were studied by the micro-incineration method, and among other interesting results were those relating to the mineral content of cerebral tumours. In these there is a great increase in the amount of mineral ash, the minerals being found in the nuclei rather than in the cytoplasm of the tumour cells. A similar increase in mineral content of the nuclei is seen in inflammatory conditions of the nervous system, particularly in meningitis and in syphilitic meningo-encephalitis. In disseminated sclerosis and in areas of softening or necrosis, on the other hand, there is a loss of mineral salts in the affected areas, only the blood vessels, infiltrating cells (especially the "scavenger" cells), and astrocytes giving a mineral residue. Two results of special interest were discovered in Alzheimer's disease. The senile plaques which form such a characteristic feature of the histology of this condition were found to contain no mineral salts at all, while the neurofibrillar "tangles" in the nerve cells differed from normal neurofibrils in that the "tangles" were rich in mineral residue, while normal neurofibrils yielded no mineral ash.

INDUSTRIAL EYE-STRAIN

There has been issued from the Factory Department of the Home Office a short but distinctly important paper entitled "Industrial Eye-strain: Special Measures Needed where Fine Work is Done."¹ Work which cannot be seen clearly in good daylight unless brought within ten inches of the eyes is fine work. There are many modern occupations that require sight at this short distance and for many hours during the day: looming in weaving, linking in hosiery, the mounting of electric lamp filaments, examining steel balls for minute defects, invisible mending, and so forth. Who has not seen girls sitting in shop windows where invisible mending is done and has not wondered at the shortness of the

focus at which the work is performed? This work demands adequate light and the correction of any inherent defects of the eyes of the workers; and in such types of occupation as have been cited great advantage can be gained by the additional provision of spherical and prismatic correcting glasses, so as to relieve the strain put upon the accommodation and convergence powers of the workers. There is a common prejudice against magnifying glasses. Perhaps resort to them is taken to be a confession of weakness. But there is no harm in the use of such glasses; indeed there are many advantages. Every ophthalmic surgeon uses powerful combinations of lenses and prisms for the better examination of the eyes of his patients. They enable him to do work that he could not otherwise do and to do it without strain. The Factory Department's paper gives examples of combinations of spheres and prisms useful for the several types of work, and which experience has shown to be suitable. Warning is given as to the need for expert examination of the eyes. "If eye-strain is experienced when the illumination of the work is good an ophthalmologist should be consulted." Slight errors of refraction are more common than is generally realized; these increase the strain of fine work. "Eye-strain may, however, be caused by wearing unsuitable glasses, so that it is important not only to obtain competent advice in the first place but also to ascertain from time to time whether any change in the prescription of the glasses is desirable. Similarly, persons who already wear glasses but experience eye-strain should make sure their glasses are suitable." This short paper should be in the hands of every doctor and every welfare worker attached to shops or factories where fine work is done.

MALARIA IN MALAYA

In the annual report of the Malaria Advisory Board for 1936,¹ Dr. A. Neive Kingsbury briefly reviews the work carried out on research and control of malaria in the Federated Malay States. Though the report is a small pamphlet of some 20 pages only, it is well worth close study. The organization for malaria control in the F.M.S. is vested in the Malaria Advisory Board. This is a strongly constituted body which in addition to research and public health representation includes the general manager, F.M.S. Railways, and the adviser for drainage and irrigation, Malay States. The carrying out of measures advised by the Board is thereby much facilitated. During the year 27,000 cases of malaria were admitted for treatment in the F.M.S.—15,880 in Government hospitals and 11,354 in estate hospitals. The total deaths among these numbered 598, or a case mortality of 2.2 per cent. The peak of highest incidence in all the States was in May, except in Pahang, where it was in June. Following the peak there is a gradual falling off in the number of cases, reaching a minimum in February and March. Special attention was given to experiments designed to test the efficacy of atebirin in treatment and prophylaxis. In a series of 200 cases

SURGICAL PROCEDURES IN GENERAL PRACTICE

This is one of a series of articles contributed by invitation

THE REMOVAL OF INNOCENT TUMOURS

BY

ERNEST FINCH, F.R.C.S.

The word "tumour" simply means "swelling," and includes those swellings due to inflammation, cystic formation, and neoplastic disease. The innocent tumour which the general practitioner is tempted to try to remove is usually one that is obvious and superficial, such as those occurring in the skin, and diagnosed as warts, moles, papillomata, sebaceous cysts, naevi, etc. The tumour may be beneath the skin—for example, a lipoma—or more occasionally it may be connected with some definite organ, such as the breast, thyroid gland, lymphatic glands, or a bone.

General Principles

For any method of treatment to be correct the first necessity is to make an accurate diagnosis, and it is in just such tumours as these that this may be so difficult. In many cases it is impossible to be certain of the diagnosis unless this has been confirmed by a skilled pathologist. Hence it is imperative that any apparently innocent tumour should on removal be submitted for microscopical examination and preferably the whole of the tissue excised, and not merely that portion of the tumour which does not look "quite normal."

"A man aged 46 presented himself at the dermatological clinic with what was diagnosed as an angioma just above the right eyebrow. He was sent to the radium department for treatment, which was carried out by a surface applicator, a portion of the growing edge being first removed for biopsy. The treatment was eminently successful, but the pathologist's report on the tissue removed was that it was a hypernephroma. The position of affairs was explained to the patient, who had never had any symptoms referable to the urinary system. He submitted to a direct pyelography, which showed a filling defect in the pelvis of the right kidney. The kidney was removed and contained a hypernephroma having the same structure as the skin tumour."

This case exemplifies another difficulty confronting the surgeon. The question is not merely whether the tumour is innocent or malignant, but whether, if malignant, the obvious tumour is the primary or a secondary growth. Every practitioner is familiar with cases of melanoma in which the secondary growths have been obvious long before the primary. The presence of pigment in a tumour, however innocent the latter may appear to be, should usually be a warning to the practitioner to leave that tumour alone and pass the responsibility for its removal on to others. It has been said that bones are full of base black ingratitude, and that when they are broken it oozes out of them; the same may be said of pigmented tumours. They must be removed entire and with as wide a margin as possible of apparently healthy normal tissue round them.

"A man aged 52 went for a walk and chafed the skin over the right heel. He tried various remedies with no avail, and then consulted his doctor during an epidemic. The doctor told him he was far too busy to attend to it, and advised different shoes and socks. The next doctor he consulted

injected some local anaesthetic and scraped the surface to promote healing. This treatment was unsuccessful. The man next consulted a chiroprapist, who tried strapping and ointment equally unsuccessfully. Nine months later the local growth was obviously a melanotic sarcoma, and the growth had already metastasized in the inguinal and femoral glands."

This case illustrates the fact that positive harm may result by not completely removing a tumour. A portion of a tumour left behind will, if it is innocent, continue to grow, perhaps with a malignant character superadded; and if malignant the rate of growth will be accelerated and the formation of metastases encouraged. This must always be remembered when a portion of the growing edge of a tumour is removed for a pathological report. How often does the patient complain that "it has got much larger since a small piece was cut out for examination"! He usually wishes the tumour to be removed for cosmetic reasons and only occasionally for pain, unless the position of the tumour is such that it is exposed to pressure or itself presses on sensory nerves. The subtlety of neoplastic disease is its painlessness until fixity occurs, and this often implies inoperability.

The doctor usually urges removal of an innocent tumour because if left it may become malignant. The only rational tumour is the lipoma; it will never disgrace its innocence, however old and big it may be. No other neoplasm can be trusted to remain benign. The very fact that the patient asks for treatment for cosmetic reasons should make the operator consider the possibilities of an unsightly scar from the operation. The resulting scar after removal of a tumour may cause much more psychical disturbance than the original tumour, and the patient, as in so many other cases, considers that the cure is worse than the disease. This is so in the removal of all tumours on the face, especially when the scar from the operation wound will be in the neighbourhood of the eyelids. The deformity resulting from a bad scar in this position can often only be rectified by an extensive plastic operation. The success of all surgical procedures, whether of the so-called "minor" or "major" type, depends upon the rigid adherence to the three fundamental principles of surgery—namely, the abolition of infection (sepsis), the control of haemorrhage, and the relief of pain.

It is precisely in the surgical removal of sebaceous cysts, ganglia, warts, papillomata, etc., that it is apt to be thought unnecessary to be too particular: these are such slight operations that a makeshift procedure may be thought sufficient. The operations must, of necessity perhaps, often be carried out under conditions and in places far from ideal; but this is no excuse for not rigidly adhering to fundamental surgical principles. It is the sepsis following the prick of a pin or needle that so often leads to a fatal septicaemia or pyaemia. No margin for error can be allowed in the preparation of the site of operation, the surgeon's hands, and the instruments, bowls, towels, swabs, and solutions used.

If the tumour is on the scalp the hair must be removed from a surrounding area wide enough for the surgeon to see exactly what he is doing, and the towels must be placed so that the ligature material and instruments are not resting on the "unprepared" surface of the face or scalp during the operation. The eyes must be protected from the

Attempts have been made to test protection in animals. Powell and Jamieson⁶ employed cultures the virulence of which was enhanced with starch, and Burnet and Timmins⁷ made use of nasal application; both groups of workers obtained a fair degree of protection. Evans and Maitland⁸ by extracting, freezing, thawing, and grinding the bacilli obtained a toxin and a "bacterial antigen" but did not achieve satisfactory protective immunity. Cruickshank and Freeman⁹ have recently re-examined the possibility of immunizing animals with intact bacilli or with extracts made by the highly promising Raistrick-Topley methods. By some half-dozen injections of either acetone-extracted culture of *H. pertussis* or an alcohol precipitate of tryptic digest these authors have secured a survival rate of approximately 90 per cent. in groups of thirty mice injected intraperitoneally with six to nine thousand million bacilli—a dose that kills the whole of the thirty non-vaccinated controls. The alcohol fraction contains no intact protein and can be stored. This method bids fair to ensure the production of vaccine that will give as high a degree of protection to mice as properly prepared typhoid vaccine will against the subsequent injection of a lethal dose of typhoid bacilli. There is ground for hoping that similar favourable results may be obtained in man.

FACTORY WELFARE

The February number of *The Times Trade and Engineering*, in addition to its usual articles, contains a lengthy supplement devoted to Factory Welfare. This supplement should prove of great value to everyone interested in factory management, and especially so if it could be re-issued in a convenient book form in place of the present newspaper pages. It for the most part relates to the new Factory Act, which comes into force on July 1, and the various provisions are explained in non-technical language by a number of past and present factory inspectors. The introductory history of factory legislation, by Mr. H. W. Younger, enables us to realize how far we have progressed since 1802, when Parliament passed an Act "for the preservation of the health and the morals of apprentices and others." Not till 1819 were children (aged 9 to 15) prohibited from night employment in the cotton mills and from working more than 72 hours a week. The regulations were gradually strengthened in subsequent years, especially in 1833, when factory inspectors were first appointed and children aged 9 to 12 were forbidden to work more than 48 hours a week. In 1850 a Ten-Hours Act was passed which limited the hours of work of women and young persons to 60 a week, but the provisions concerned only the textile trades, and it was seventeen years later before they were extended to other industries. It seems astonishing to us with our present-day outlook that the first medical inspector was not appointed by the Home Office until 1898, and the modern welfare movement in industry, as we now know it, did not begin

until the war. Its origin was largely due to Mr. Lloyd George, who as Minister of Munitions set up a department to deal with the health of munition workers. In 1918 the Industrial Welfare Society was founded, with the King (then Prince Albert) as President. The main details of the new Act are explained at some length by Sir Gerald Bellhouse, formerly Chief Inspector of Factories, while other articles deal with such topics as lighting, heating, ventilation, canteens, sanitation, the fencing of machinery, first aid, and the application of psychology to industrial problems.

EPIDEMIOLOGY OF PLAGUE

The report of the Haffkine Institute for 1936 includes some interesting and important observations on the epidemiology of plague. It has been believed that, even when plague among human beings has come to an end in a particular locality, the disease continues to smoulder among the rats, which thus acquire a high degree of resistance. This theory is refuted by the results of the daily examination of large numbers of rats in Bombay during the two years preceding the report. In no case was any sign of infection found. An alternative hypothesis maintained that, during an epidemic in a locality, rats acquired immunity and transmitted it to their young. Investigations with white mice by Sokhey demonstrated that the young born of parents fully protected against plague showed no immunity whatsoever. In the course of these observations rats had been obtained from Dharamsala, a hill station in the Himalayas where plague had not recently occurred. Some of these rats nevertheless showed high resistance to plague, indicating that there exist in nature strains of rats which are naturally immune. It would thus appear that the cause of cessation of an epidemic in a locality is the death of the susceptible and the survival of the naturally resistant strains. How then do fresh pandemics or epidemics begin? A further observation throws light on this problem. While it was found that the house rat (*Rattus rattus*) was chiefly responsible for the spread of plague to human beings in Bombay, another animal, the small field rat (*Gunomys varius*), was incriminated in certain districts. Examination showed the small field rat to be highly susceptible and the house rat highly resistant. These observations indicate that an increase in numbers of this small field rat, or its replacement of the house rat in human habitations, sets the stage for the outbreak of a fresh epidemic. The report stresses the importance of concentrating on further studies of plague during periods of quiescence following a pandemic with a view to devising intelligent means of preventing fresh visitations. "Unless deliberately prevented, pandemics are likely to come again as they have come in the past."

The Secretary of State for the Colonies has appointed Dr. A. J. R. O'Brien, C.M.G., M.C., M.R.C.P., D.P.H., Assistant Medical Adviser in the Colonial Office, to be his Chief Medical Adviser in succession to the late Sir Thomas Stanton.

These tumours are sometimes very large, and after removal a big cavity is left; all obvious bleeding points should be secured and ligatured, and drainage of the cavity carried out for twenty-four hours.

Fibromata

Fibromata are clinically divided into soft and hard varieties. They may occur in many different organs, have a wide distribution, and may be single or multiple. They must be removed completely, including the capsule, by dissection, and cannot be enucleated satisfactorily. Diagnosis is often so difficult in these cases that the whole tumour should be submitted for expert pathological opinion. Those occurring in connexion with fascia are known as "recurrent fibroma," and are probably fibrosarcomata from their inception. Fibromas, usually of the hard variety, occurring in connexion with nerves are single or multiple as elsewhere; if single, the pain experienced when the tumour is subjected to pressure may be intense: an example of this is "the painful subcutaneous nodule" often met with on the sole of the foot. The single neurofibroma must be removed by dissection, but multiple fibromas are best left alone and the deformity accepted.

The fibromatosis that sometimes occurs in a scar, known as keloid, is best left alone unless it causes great pain. It can, however, be removed, but the condition will generally recur in the new scar, though it is then usually not so painful. A fibroma (epulis) often grows from the alveolar or dental periosteum around the neck of a tooth. It must be removed whole, and this means that in most cases one or two teeth will have to be extracted to expose the origin of the tumour, or even a small portion of the alveolar margin excised to make complete removal certain. It is advisable that the whole tumour should be sent to the pathologist for microscopical examination.

Chondromata

These tumours, usually multiple, occur most commonly in the metacarpal and phalangeal bones, and if left will ultimately protrude through the compact bone. If small they are treated by enucleation, and as they have no connexion with the articular cartilage removal will not interfere with the growth of the bone or the function of the joint. A bone-graft may have to be inserted into the parent bone to prevent post-operative fracture. If the tumours are large amputation will have to be considered. The cartilage may calcify, but ossification rarely takes place; malignant change may also occur. Before any operation is undertaken it is desirable to have both hands radiographed.

Osteomata

The cancellous variety of osteoma in the neighbourhood of the epiphyseal cartilage usually develops in a growing bone, but in most cases ceases to increase before the end of the normal period of growth. As a rule the tumour has a bulbous end covered with hyaline cartilage and a pedunculated base. An adventitious bursa is often present over the bulbous extremity, giving rise to a sense of fluctuation. If the tumour is causing any disability it must be removed through a generous incision, and important structures surrounding it, such as tendons, blood vessels, and nerves, should be adequately retracted and respected. The whole tumour, including the bursa, the hyaline cartilage, and the portion of compact bone from which it is growing, should be removed. The cancellous tissue of the parent bone is thus opened up when removing the flake of origin from the compact tissue; consequently,

if sepsis supervenes it may spread to the diaphysis. These tumours are often multiple, and others should be looked for and the patient's attention drawn to them.

The subungual exostosis usually appears on the dorsal surface of the terminal phalanx of the big toe. It gives rise to intense pain and projects under the nail bed. The nail often breaks off and there is ulceration of the bed. The resulting granulation tissue may mask the small tumour, which is either an exostosis or a fibroma. Treatment consists in removing the nail and also the whole of the underlying tumour by curetting it out of the parent bone: occasionally partial amputation of the terminal phalanx is necessary.

Ganglia

A ganglion is a cystic swelling in the neighbourhood of a joint or tendon sheath occurring commonly in the region of the wrist or foot. It may disappear spontaneously or after subcutaneous rupture caused by injury, or even occasionally after the fluid, if thin enough, has been removed by aspiration. The injection of sclerosing fluids—for example, sodium morrhuate 5 per cent.—has been recommended after aspiration, but these methods are so uncertain that radical excision by sharp dissection is looked upon as the method of choice. The associated tendons must be carefully retracted and not injured, and the whole of the cyst wall should be removed if possible. Any extension of the cyst wall between adjacent tendons should be carefully dissected out, and also any other smaller cystic formations in the neighbourhood. The joint capsule may be opened during the dissection, hence the importance of careful haemostasis after excision; and in addition, if the joint capsule has been opened, rest to the joint on a splint is advisable for a few days.

Bursae

These are often enlarged, and need excision owing to attacks of inflammation and pain. The same care should be taken in their excision as in the case of ganglia, the whole of the capsule being removed.

Conclusion

After excision of a tumour the closure of the wound needs the greatest care. An unsightly scar is to be avoided. The incision should, if possible, be planned in one of the lines or natural creases of the skin; fine needles should be used and accurate apposition of the skin edges obtained without tension or overlapping. A subcuticular suture is specially indicated in face wounds. All haemorrhage should be meticulously controlled, and the aseptic technique employed must be beyond criticism.

The operative field should be kept at rest as much as possible for a few days after the operation.

The whole of the tissue removed in excising any wart, mole, papilloma, naevus, fibroma, etc., should be sent for expert pathological opinion, and the report carefully filed for future reference.

After the operation the patient should be seen at the latest within twenty-four hours and inquiries made as to post-operative pain, throbbing of the wound, etc. If sepsis supervenes stitches will have to be removed as necessary and appropriate treatment instituted. The stitches may be removed in a few days. If a catgut subcuticular suture has been used it should be left, but if the suture is of non-absorbent material it should be removed when it has properly loosened, which is usually in about ten days.

The result of these small operations ought to be most gratifying to the patient and to the surgeon.

effects of the solutions used in the preparation of the skin, which is best done with methylated spirit. The operation will usually be performed with local anaesthesia, and in all cases the co-operation and the psychical control of the patient are necessary.

There are various methods by which innocent tumours may be removed: These are:

1. Excision, with a margin of surrounding healthy tissue.
2. Enucleation, either from within the capsule or including the capsule.—In the removal of cysts it is most important that the whole of the membrane lining the capsule should be removed, and in order to do this the capsule should, as a rule, be removed as well.
3. Destruction of the tumour mass.—This may be achieved by various cauterizing agents, such as acids, carbon dioxide snow, diathermy, electrolysis, radium, or deep x rays. The practitioner usually has only acids and carbon dioxide snow at his disposal, so of necessity the other methods must be left to experts.

It must be remembered that, with the exception of radiotherapy in the hands of an expert, all these methods leave a scar. Treatment with radium is certainly the least painful means to employ, but the pain of the subsequent reaction may be considerable, and if an overdose is given the resulting scar may be not only unsightly but a distinct menace. The treatment of tumours by any method of irradiation should be left strictly to experts. The treatment of angiomas by the injection of boiling water has been warmly recommended by some; but the technique is difficult, the procedure apt to be very painful and the result disappointing; it is therefore not to be recommended for general use. The methods adopted will naturally differ according to the nature of the tumour, its situation, and the appliances available.

Papillomata

These may be the result of local infection and discharges, which if present must first be cured. The papillomata will perhaps then disappear; if they do not they can be treated with trichloroacetic acid (100 per cent.) or be excised. Warts which occur on the fingers, especially in children, may be flat or pedunculated. They are usually multiple, often appear in successive crops, and several may coalesce to form quite a large mass. They are treated by cauterizing each individual wart daily with 10 per cent. salicylic acid collodion, or by dropping pure glacial acetic acid or fuming nitric acid on to the wart from a glass rod once a week. Carbon dioxide snow can be used by making the solid stick from the gas, cutting the stick for half of the wart, and applying it by steady pressure for half a minute. Considerable pain may follow later when the reaction occurs.

If these methods are not successful then irradiation by x rays or radium should cure; otherwise the papilloma must be removed with an adequate margin of healthy tissue. Warts, often pigmented, occurring in the elderly, may be the starting-point of malignant disease, and, if growing, must be excised, a sufficient margin of healthy surrounding tissue being taken at the same time.

Angiomas (Vascular Naevi)

These tumours are usually congenital, the capillary and cavernous types being the most common. A naevus, however small, should be treated as soon as possible. Radium is now the method of choice. If the growth is thin and small treatment with carbon dioxide snow is effective. The snow is applied for half a minute, and

the treatment repeated if necessary. The reaction may be severe, and subsequent applications should only be given when it has subsided. If the naevus is excised the incisions should be made outside the margin of naevoid tissue, thus minimizing haemorrhage and ensuring complete removal.

Sebaceous Cysts

These are the commonest tumours met with in the skin; they are tumours definitely in the skin. The usual indications for removal are disfigurement and attacks of inflammation. They are removed by enucleation or dissection, but whichever method is used the whole of the cyst wall must be taken away. Incomplete removal of the cyst wall results in recurrence, sinus formation, or the appearance of a granuloma known as Cock's peculiar tumour, which may be mistaken for an epithelioma.

Enucleation is carried out by transfixing the base of the tumour with a narrow-bladed scalpel and cutting right through the cyst wall on to the surface. The contents of the cyst are then expressed and the divided cyst wall on each side seized with forceps and twisted out entire, any adhesions between it and the surrounding tissues being divided with scissors.

If the cyst has been inflamed it is better removed by dissection. An elliptical incision is made over the most prominent part of it, the ends of the incision projecting well beyond the actual cyst wall; the skin is then undermined on each side until well clear of the tumour, and the whole cyst in its capsule dissected out, with the elliptical piece of skin attached to the prominent part. Haemorrhage is stopped by the ligature of vessels, and the skin edges are approximated. If the cyst is on the scalp, haemorrhage is controlled not only by ligature and the sutures approximating the skin but by pressure exerted on to the raw surface by bandaging firmly against the skull. If the position of the cyst is such that firm pressure cannot be exerted and there is a general ooze from the raw surfaces, a narrow piece of sheet rubber should be inserted as a drain for twenty-four hours.

Other cysts occurring immediately beneath the skin, such as implantation cysts and dermoids, should be dissected out; if the raw surface oozes, drainage should be established for twenty-four hours. It is advisable that the drainage rubber should always either be stitched to the skin or have a safety-pin attached so that it cannot slip into the cavity and subsequently cause a sinus.

Lipomata

These constitute the most benign of neoplasms. They are usually encapsuled. The capsule is tense and fibrous, being firmly connected to the surrounding structures but not to the neoplasm. The diffuse lipoma is not very amenable to treatment, as it will recur in course of time owing to the impossibility of removing it completely. Any specially painful lipoma—for example, in the condition known as adiposis dolorosa—can be removed easily, but as a rule some other tumour, which has previously been painless, becomes the seat of pain, and in its turn will have to be excised. A lipoma should be removed through a generous incision, so that all the outlying nodules of the neoplasm are excised. The incision should be made deliberately through the skin and into the tumour, the enucleation thus taking place from within the capsule. If the incision is not large enough outlying nodules may be left, and these will continue to grow and another tumour form.

from 1852 until it was incorporated with the *Dublin Medical Press* in January, 1866. He died in 1869, aged 64, and was buried at Sutton Bonnington, Notts, where his eldest son was rector.

Migrations of the Hospital

At his hospital Yearsley had as a colleague Peter Allen and, from 1866, Edward Bishop. Sir William Wilde, the famous Dublin aurist and father of Oscar Wilde, was for a time a member of the committee of management, but apparently not on the active surgical staff. Toynbee died in 1866, the victim of experimenting with prussic acid and chloroform as an inhalation to relieve inflammation of the ear, and Peter Allen succeeded him as aural surgeon to St. Mary's Hospital. After the death of Yearsley the hospital, with Bishop, Abbot Smith, and Charles Lovegrove as surgeons, moved first to Red Lion Square, and later, in 1875, to Howland Street, the leading members of the staff then and for many years being George Saunders, Jacob Pickett, and Dawson Nesbitt. In 1893 it was moved to Grafton Street, Tottenham Court Road, where the staff was joined in 1897 by Hemington Pegler and Frederick Spicer, and it was through their efforts that the hospital was reorganized, the honorary surgical staff strengthened, the late Earl of Crawford became an active chairman (he was succeeded on his death by his son, the present Earl of Crawford and Balcarres), and in 1911 a move was made to Fitzroy Square, where the hospital still remains. With the aid of a substantial legacy from the late Mr. Hovis Smith it is to be rebuilt in its centenary year upon its present and an adjoining site.

R. S. S.

PHILIP SYNG PHYSIC (1768-1837)

Philip Syng Physic, the father of American surgery, was born on July 7, 1768, at Philadelphia, where he received part of his medical education before going to London, where he became John Hunter's favourite pupil and house-surgeon at St. George's Hospital in 1789. Two years later he went to Edinburgh, where he qualified in May, 1792, with a thesis on apoplexy. In the following September he returned to Philadelphia and gained considerable experience in an epidemic of yellow fever in 1793, when he became the surgical consultant of Benjamin Rush, to whom in turn he sent his purely medical cases. In 1794 he was appointed surgeon to the Pennsylvania Hospital. Until 1800, when Physic gave his first lesson in surgery, no separate teaching on this subject had been attempted in Philadelphia, surgery being included under the department of anatomy in the University of Pennsylvania. Five years later a chair of surgery was founded which Physic was the first to occupy, and he held it until 1819, when he was elected professor of anatomy, and continued in that office until 1831.

Although he published little of importance himself Physic exercised considerable influence on American surgery, his teaching having been preserved in a treatise on surgery by his nephew, John Syng Dorsey, whom he succeeded in the chair of anatomy in 1819. American surgery was indebted to him for the introduction of absorbable ligatures, the use of the seton in ununited fractures, the operation of artificial anus, the advocacy of rest in hip disease, the invention of a tonsillotomy, a modification of Desault's splint, his description of diverticula of the rectum, and washing out the stomach with a syringe and tube in cases of poisoning. Physic also gained a well-merited reputation as an ophthalmic surgeon and as a lithotomist, his most famous operation being on Chief Justice Marshall, from whose bladder he removed a thousand stones with complete success. The honours bestowed upon him included honorary membership of the French Academy of Medicine and fellowship of the Royal Medical and Chirurgical Society. His death from myocardial failure and general anasarca took place on December 15, 1837.

MINERS' NYSTAGMUS

REPORT OF THE DEPARTMENTAL COMMITTEE ON WORKMEN'S COMPENSATION ACTS

The Departmental Committee appointed in 1935 has now issued its report on certain questions arising under the Workmen's Compensation Acts. The report—which is the result of an inquiry brought about by the general dissatisfaction with the diagnosis, certification, and management of cases of miners' nystagmus—is divided into three parts, of which the first is concerned with miners' nystagmus, the second with general medical procedure, and the third with lump-sum settlements. We shall here deal chiefly with the first and most important part.

The report contains some very interesting information concerning the history of miners' nystagmus: the cost (£450,000 yearly in compensation alone); the number of cases (averaging nearly 10,000 for several years, of which 2,000 are new); the distribution according to coal-fields; and the number of partially disabled men at work. Its main conclusions are: that the determining cause of miners' nystagmus is the low standard of underground illumination and that the cap-lamp should be in general use. The description of the disease is to be altered to "miners' nystagmus—process mining." Cases are not to be certified unless oscillations are found to be present for a definite period (at least fifteen seconds after stooping exercises in the dark).

Provision of Medical Boards

The provision of suitable work is essential for recovery. The necessity for co-operation between employers and workmen is insisted upon, and the Home Office is to obtain an undertaking from the Mining Association or individual colliery owners that they will do their utmost to provide suitable work. The certifying surgeons are to be retained, but medical referees are to be replaced by medical boards consisting of one ophthalmological surgeon and one physician. The decision of these boards is to be final. The committee does not curtail the right of the employers to have medical examinations made on their behalf, and presumably these reports may be forwarded to the board. It is the intention of the committee that this medical board shall have charge of all cases of miners' nystagmus throughout their course and that it shall decide whether the workman is fit for work; the nature of the work is also to be specified. A report on "The Diagnosis and Certification of Miners' Nystagmus," by a committee of the British Medical Association, was published in April, 1936, by order of Council (*British Medical Journal Supplement*, 1936, 1, 238). The conclusions of this committee are in almost complete agreement with the findings of the Departmental Committee outlined above. The B.M.A. committee strongly advocated the replacement of medical referees by medical boards, which should consist of two ophthalmic surgeons and one physician. They were of opinion that these boards should be utilized for disputed cases only, as they felt that most cases arising under the Workmen's Compensation Acts were settled without trouble, by mutual consent between employer and workmen.

The proposal of the Departmental Committee to make these medical boards responsible for the management of cases throughout their whole course is a striking departure from the procedure of the last thirty years. This proposal sets up State control of a section of the Workmen's Compensation Acts, the medical boards being elected and supervised by the Home Office. The duties of the boards will be to ascertain the extent of disablement and to advise the employer and workman when the latter is fit for work. The board will also supervise each case throughout and will call the men up for periodic re-examinations. There are obvious objections to boards consisting of two members, but it is probable that the

Nova et Vetera

JAMES YEARSLEY AND THE METROPOLITAN EAR, NOSE AND THROAT HOSPITAL, 1838-1938

The Metropolitan Ear, Nose and Throat Hospital, which celebrates its centenary this year, is the oldest ear, nose, and throat hospital in this country, and apparently in the world. It is true that Moorfields was started by John Cunningham Saunders in 1805 as an eye and ear infirmary, but only two years later it became an exclusively ophthalmic hospital, the first of its kind in the world; and that in 1816 an ear dispensary (which became in 1845 the Royal Ear Hospital) was established in Soho "in order to advertise his claims as an aurist" by John Harrison Curtis, a notorious quack with no medical qualifications, who had been a dispenser in the Navy and married a lady of means. But the Metropolitan Ear, Nose and Throat Hospital, founded as the Metropolitan Ear Institution, was from the first a hospital for the treatment of diseases of the ear, nose, and throat, and James Yearsley, its founder, repeatedly pointed out in his writings the influence on the ear of affections of the nose and throat, particularly in causing deafness. The gross ignorance and curious activities of Curtis, who for a time made £5,000 a year attending King George III, Cabinet Ministers, and half the aristocracy, before he fell into penury and fled the country, brought the specialty of the aurist into the lowest repute, from which it was raised by James Yearsley and Joseph Toynbee. Toynbee has been called the father of English otology, but if anyone really deserves that title Yearsley has at least as good a claim as Toynbee.

Early Work in Otology

Although Servetus, Eustachius, and Fallopius all described the ear in their anatomical writings in the sixteenth century, it was Joseph Guichard Duverney (1648-1730), professor of anatomy in Paris, who wrote the first treatise on otology in 1683, and Valsalva published his famous work on the anatomy and physiology of the ear in 1717. Guyot, the postmaster at Versailles, in 1724 succeeded in alleviating his own deafness by introducing through his mouth into the Eustachian tube a catheter through which he injected liquids; he communicated a description of the procedure to the French Academy of Sciences, which rejected it as ingenious but impracticable. Archibald Cleland, surgeon to Wade's Regiment of Horse, improved on this by passing the catheter through the nose and injecting warm water or blowing air through it (1731), and Jonathan Walther (1755) treated catarrhal deafness by this method. In 1802 the great Sir Astley Cooper received the Copley Medal of the Royal Society for his memoir on perforating the tympanic membrane for deafness resulting from obstruction of the Eustachian tube in twenty cases, but he withdrew from aural surgery "as he was afraid to be thought an aurist." In 1821 Jean-Marc Itard, physician to the Royal Institution for the Deaf and Dumb in Paris, published his textbook *Mémoire sur les Maladies de l'Oreille et de l'Audition*, the first treatise on diseases of the ear, and led the ascent of otology from empiricism.

James Yearsley

James Yearsley was born at Cheltenham in 1805, and was apprenticed to Ralph Fletcher, a celebrated surgeon of Gloucester, whose daughter he subsequently married. On leaving Gloucester he became a pupil at St. Bartholomew's Hospital, and took the diploma of M.R.C.S. in 1827; some years later he graduated M.D. of St. Andrews University. After practising for a short time at Cheltenham and Ross-on-Wye he came up to London to practise as an aural surgeon, and soon achieved success. His writings show that he was familiar with the work of Itard,

Deleau, Kramer, and other Continental otologists, but there is no evidence that he studied abroad. He founded the Metropolitan Ear Institution in Sackville Street, Piccadilly, in July, 1838, and in 1840 he published a textbook, *Diseases of the Ear* (London, Churchill, 1840). In his preface he observes:

"Almost all diseases of the ear originate in a morbid condition of the mucous membrane of the throat, nose, and ear, which becomes affected from a variety of causes, among which cold, the exanthemata, especially scarlatina, and stomach derangement stand pre-eminent."

In this book he describes and illustrates his operation for removing the tonsil, holding it in a powerful-sprung, tenaculum and dissecting it out with a hawk-bill-shaped knife; he states (in his third edition, 1850) that he had removed the tonsils from the throats of more than 1,400 patients. He all but described adenoids many years before Meyer of Copenhagen (1862) recognized and described them:

"I have sometimes suspected an overlapping of the mouths of the Eustachian tubes by the loose mucous membrane, and the results of treatment have occasionally justified the opinion I had formed; for shortly after excision of a small slip of mucous membrane from underneath the arches of the palate, amendment more or less considerable [in hearing] has taken place" (p. 138).

Yearsley and Toynbee

In the *Lancet* of July 1, 1848, Yearsley published an account of his "artificial tympanum" (a small pellet of moistened cotton-wool), which is still employed as a valuable aid in improving the hearing in deafness due to a post-suppurative perforation of the tympanic membrane. Toynbee in 1853 contrived another kind of artificial drum, consisting of a thin disk of vulcanized india-rubber with a stem of fine silver wire. Unfortunately controversy then ran high between the two aurists, who each claimed to have originated the artificial tympanum, and according to Peter Allen (who worked with Yearsley and succeeded Toynbee) "the war of words was long carried on with an unseemly bitterness, which was much to be regretted, on both sides." Yearsley was an enthusiastic advocate of the value of Eustachian catheterization in the treatment of deafness, and he states that he demonstrated his method to hundreds of medical practitioners anxious to learn how to pass the Eustachian catheter. Toynbee, on the other hand, discarded catheterism because, according to Peter Allen, he believed (erroneously) that during the simple act of swallowing with the nostrils closed the air in the drum is condensed. According to J. F. Clarke of the *Lancet*, a contemporary medical writer, Toynbee was an anatomist rather than a clinician: "Toynbee's splendid dissections were associated with no therapeutic or practical results." Certainly he dissected nearly 2,000 temporal bones, he was made an F.R.S. "entirely for his dissections," and the Toynbee Collection is to-day still one of the features of the Royal College of Surgeons Museum. Toynbee was the first aural surgeon on the staff of a general hospital in London, being appointed to the newly established St. Mary's Hospital in 1852. His textbook on diseases of the ear was published in 1860.

James Yearsley is memorable in other directions in the history of medicine. At the period when he came to London no hard-and-fast line was drawn between the qualified and the unqualified medical practitioner, as witness the case of John Harrison Curtis, nor was there any simple criterion by which the general public could distinguish the quack from the reputable practitioner. Yearsley, in conjunction with Tyler Smith and Forbes Winslow, founded in 1846 the *Medical Directory*, of which he soon became the sole proprietor on the retirement of his two partners. This directory was a precursor of the Medical Registration Act of 1858, as it showed clearly the advantages of placing the whole medical profession on one recognized list. Yearsley was also the originator and proprietor (though not the editor) of the *Medical Circular*

due to industrial disease. Above all, the report, by "the elimination of a hopeless dependence on compensation by provision of work . . ." (quoted, in para. 101 of report, from the Third Report of the Miners' Nystagmus Committee), holds out hope for those partially disabled men who, from being unemployed, become unemployable.

It will be a matter of congratulation to the Council and members of the British Medical Association that the findings of the Departmental Committee follow so closely the recommendations of their own committee. The Departmental Committee has done its work well, and has put forward valuable recommendations which will simplify the workings of the Workmen's Compensation Acts.

THE NEW MATERNITY SERVICES

ADDRESS BY SIR COMYNS BERKELEY

A new maternity home was opened at Hull on February 15, having as its object the service of middle-class women. The home is an adjunct to the Hull Hospital for Women and is named after Dr. Ethel Townsend, a Hull practitioner, who gave £5,000 towards the cost of the building. The opening ceremony was performed by Sir Comyns Berkeley, chairman of the Central Midwives Board, who took occasion in an address to pass in review the maternity services of the country in the light of recent developments, dealing first with the question from the point of view of poor mothers, then from that of the medical student, the future family doctor, and finally from that of women who were neither poor nor very well-to-do.

Sir Comyns Berkeley began by relating the circumstances which led to the passing in the early part of 1936 of the Midwives Act, following upon the Ministry of Health report on maternal mortality. Even before the passing of this Act, he said, some very valuable services were available to the pregnant woman if she cared to avail herself of them and if local authorities exercised their powers to provide them. But the new Act might be described as the "mothers' charter." It made provision for a domiciliary service of full-time salaried midwives, care being taken in the establishment of such a service that the most suitable women were attracted to this field, that their conditions of employment, with reasonable salaries and holidays, enabled them to give of their best to their patients, and that their skill and knowledge were maintained at a high standard.

In the past the midwifery service (said Sir Comyns Berkeley) had not been all that could be desired; many midwives had lacked sufficient practical experience to ensure that they were well up in their work. But the new Act had resulted in the resignation (with monetary payment) of a large number of women who were too old to continue in practice or who attended only a very few cases in the year. At the same time arrangements had been made for refresher courses for all midwives continuing in practice. One of the most important suggestions made by the Minister in the report on maternal mortality was that there should be expert obstetricians available for consultation with the doctors in each district. In towns where there was a maternity hospital or department of any size it was important that what was known as a flying squad—an expert obstetrician and qualified obstetric nurse—should be attached, in readiness for summons, with the necessary equipment, to the home of a patient who could not be moved. It would be left to the local medical profession and the local authorities to ensure that the best obstetric skill was available, and he was confident they would not be found wanting.

Medical Students and Midwifery

With regard to the medical student (Sir Comyns Berkeley continued) it was well known that for many years past medical students had been starved of experience in

practical midwifery owing to the fact that the General Medical Council had not stipulated for a period of training in that subject comparable to that on which it had insisted in medicine and surgery, and also to the fact that there were not sufficient cases for the student to obtain an adequate training. The General Medical Council stipulated that before he could enter his final examination the student must have attended and delivered twenty women in labour. The Central Midwives Board had had the same regulation for pupil midwives, but there had been this difference, that whereas the Council had to wink at its regulation because there were not enough cases for the students, the Board rigidly refused to allow any pupil midwife to enter for its examination until attendance on twenty cases had been certified. Several of the teaching hospitals which trained also pupil midwives had given these women their twenty cases, allotting the remainder—not many—to the medical students. But 70 per cent. of the women on the midwives' roll never practised as midwives; they took the Board's diploma as an extra qualification.

The Board had now come to the rescue of the General Medical Council by refusing to give separate approval for the training of pupil midwives to any hospital which trained medical students unless and until those students had had twenty cases each or as many as were available short of that number. Moreover, the training of midwives under the new rules was in two parts, the first of these including thorough instruction in all branches of midwifery but with attendance on only ten labours. It was hoped that this would satisfy nurses who wished to receive some training but did not intend to practise midwifery, and many more cases would thus be available for medical students and for women who contemplated practising as midwives.

Needs of the Middle-class Mother

Finally, Sir Comyns Berkeley turned to the needs of the middle-class mother. She belonged, he said, to the section of the community which was worse off as regards maternity services. It was true that under the new Midwives Act any mother, whatever her circumstances, could obtain the services of a salaried midwife, or of a maternity nurse if she was attended by her own doctor, at a very reasonable fee. Nevertheless the accommodation for their confinement was to many of these women an embarrassing question. They did not wish to enter the maternity ward of a hospital, a nursing home was expensive, and their own home, perhaps a small flat, was unsuitable. Some hospitals had private maternity wards, and in a few the prices were reasonable and the family doctor could have charge of his patient. But there was very great need in every district of any size for properly equipped maternity homes or departments at which reasonable fees were charged, and at which the patient's own doctor could provide the attendance. He added that the citizens of Hull might well feel proud of this further improvement of the maternity services of their city, and they with the medical practitioners of the district would be deeply grateful to Dr. Ethel Townsend for her munificent benefaction.

Special Report No. 45 of the Food Investigation Board of the Department of Scientific and Industrial Research is entitled *Microbiology in the Preservation of Animal Tissues*. The author, Dr. R. B. Haines of the Low Temperature Research Station, Cambridge, regards the successful storage of animal tissues as an exercise in applied microbiology. The report is divided into three parts. Part I deals with the access of bacteria to the tissues; Part II with aspects of the physiology and biochemistry of bacteria and of the tissues of the host; and Part III with the control of infection and growth. Two appendices describe methods and apparatus employed, and the report concludes with a very full bibliography, comprising 261 references.

question of expense and the greater difficulty of arranging meetings determined the findings of the committee. It will be difficult to constitute these boards throughout the country, and much care must be given to the selection of personnel. Difficulties of administration are also likely to be great, and there will almost certainly be some delay in dealing with references. The expense of these boards is to be met by fees from the industry and a contribution from the Exchequer. There is at present no definite scale of fees laid down as suggested in the B.M.A. report. All men must appear before the board, and the only medical evidence allowed in a county court is a report from the board. The committee hopes that only exceptional cases will proceed to litigation.

Use of the Cap-lamp

The committee realizes that the best way of coping with the disease is by preventive measures, and they urge the more extended use of the cap-lamp (over 80,000 of which were in use in June, 1937) as the best means of attaining the upper standard of 0.25 foot-candle on the working area advised by the Miners' Nystagmus Committee in its Third Report (M.N.C. Third Report, Medical Research Council, Special Report Series No. 176, p. 8). Recent mining regulations have brought into use improved lamps (Coal Mines General Regulations (Lighting), 1934: S.R. and O., 1934, No. 562). There has in recent years been a welcome fall in the number of new cases certified, and if this fall continues the collieries will be able to absorb all partially disabled men. The provision of suitable work for such men has been strongly advocated for years by all medical authorities, and the committee is to be congratulated on obtaining pledges from the colliery owners that this work will be found if possible. The problem is economic rather than medical. The number of men now employed on the surface has been greatly reduced by the introduction of labour-saving machinery, and with the best will in the world it may not always be possible for the owners to provide work in all cases.

Definition of Nystagmus

The alteration in the definition will be generally welcomed, and it is probable that the number of fresh cases will fall. The old loose definition was an anomaly, and was the chief cause of the diversity of medical views referred to in para. 68 of the report. No fresh case of miners' nystagmus should have any difficulty in passing the test laid down: definite oscillation for fifteen seconds after stooping exercises in the dark. In the past many cases were certified on the strength of a single flicker. Most cases of miners' nystagmus are managed by the large mutual indemnity companies, whose individual members are generally responsible for the first twenty-six weeks of the cost. The report suggests that the whole of the employers' liability in respect to miners' nystagmus should be covered by insurance. The question of susceptibility to attack has led the committee to recommend that young men severely affected by miners' nystagmus before the age of 30 should be suspended from underground work by the medical boards. This was also a recommendation of the B.M.A. committee.

The Question of Re-employment

The liability to recurrence has made it almost impossible for men to obtain re-employment underground with other employers, and has been the cause of much litigation in the higher courts. The report lays down the simple rule that if a man who has suffered from miners' nystagmus obtains work with another employer the original employer is liable if breakdown takes place within three years. If failure takes place after three years a fresh certificate is necessary and the case is regarded as a new one. To encourage employers to re-engage men it is suggested that an insurance pool should be established in each coal-field to cover the entire liability for miners' nystagmus. The owners would then only have to pay their subscription to the pool. The simplest way out of the difficulty would be to forbid any man certified as suffering from miners'

nystagmus to work underground again. This would entail great hardship on men who have only one occupation and who are incapable of adapting themselves to other work. The aim should be to improve the working conditions, and all that may be necessary in individual cases is the provision of a cap-lamp. Although the number of men employed in the industry has fallen in recent years by one-third, there is still a shortage of skilled colliers, the class of men chiefly affected.

Elsewhere in this issue is a suggestive paper by Dr. Raymond Brock of Wrexham, to which the reader is referred for a discussion as to the causes of miners' nystagmus. Dr. Brock thinks that failure is caused by a breakdown of the man's ability to stand the stresses of the mine—poor illumination and danger. In his view disability, when it arises, is due to an associated psychoneurosis. In a large number of cases disablement is entirely due to ocular movement, and the man is otherwise well. In others the symptoms which Dr. Brock describes appear either at once or after a period of unemployment, and may be correctly described as due to an associated psychoneurosis. Other men come out of the pit with well-marked anxiety neurosis and no oscillation. In the B.M.A. report the considered opinion is given that these men should not be considered cases of miners' nystagmus, and that the continued payment of compensation in these cases perpetuates in the mind of the sufferers, and of the medical men who are asked to certify them, a false conception of the disease. The Departmental report recognizes this type of case and expresses the hope that the change of the definition will eliminate them. These cases have been largely responsible for the difference of opinion, and it will be the duty of the medical boards to educate both workmen and medical men to a truer conception of this disability.

Cases Other than Miners' Nystagmus

The second part of the report deals with medical procedure in cases other than miners' nystagmus. The medical referees are to remain, with their numbers strengthened by the inclusion of more specialists. Appeals may be made from the medical referee to "medical appeal tribunals," which bodies are to be set up by the Home Office in ten or twelve large centres. The right of the employer and workman to arbitrate on medical issues is to be withdrawn, and these issues are to be settled by the tribunals alone. The certifying surgeon is to function as before, and the tribunals are to consist of three members, one of whom is to be an appropriate specialist. One very important recommendation is that approved societies are to make advances of sickness benefit to workmen while they are awaiting a decision as to their claim for compensation.

Part 3 deals with lump-sum settlements, and the report says that these settlements are generally popular with both employers and workmen and that as a rule they are used to advantage. They should be subject to the approval of the registrar, who should see each man and obtain a report from the medical referee if necessary.

Expected Beneficial Results

If these recommendations receive Parliamentary sanction, what benefits are to be expected? Disputed cases will be settled away from the disturbing influence of the courts. The system of reference will be greatly strengthened, and the aggrieved party will have the right of appeal to a strong medical board, except in cases of miners' nystagmus, which will be dealt with by a board from the first. The moneys formerly expended in litigation will, or should, be more profitably devoted to the rehabilitation and training of workmen. A strong lead is given to the prevention of miners' nystagmus by the insistence on good underground illumination. The reversion to the old description of the disorder—"miners' nystagmus"—and the standard of incapacity laid down will be a safeguard against the certification of cases not

the use of guinea-pigs and the virus of equine encephalomyelitis, these animals not being subject to poliomyelitis. It was discovered that the virus in this case used the same path in order to ascend to the brain.

The work carried out along these lines began by dropping a solution of tannic acid into the nose of guinea-pigs. Tannin had the property of coagulating albumin, and thus a layer of coagulated albumin was formed over the olfactory hairs. If the interval was not too long this layer of tannic precipitate excluded the virus, and whereas 100 per cent. of the animals would die if not so protected, few or none of them died during the few days for which this protection lasted. This led immediately to an effort to block the passage in monkeys, and a very considerable number of chemicals were tried. The one most successful was a 1 per cent. solution of zinc sulphate, which gave a protection lasting two or three months after the instillations had ceased.

The difficulty encountered in the human being was that the middle turbinate bones deflected the fluid, so that it did not pass over the olfactory mucous membrane. It became necessary to devise special atomizers for the purpose and to watch the process with a mirror. This was a performance requiring special skill, and not to be roughly improvised during an epidemic. The zinc sulphate solution, which was so mild that it did not hurt the conjunctiva, was painful when applied to the olfactory mucous membrane, but this disadvantage was overcome by procaine.

Last summer during an outbreak of poliomyelitis in Toronto an effort was made to test the zinc sulphate application. The report stated that nearly 5,000 children were sprayed twice by forty-four oto-rhino-laryngologists in eight hospitals, and about 6,000 controls were taken. Among the 4,713 children who were sprayed twice eleven cases of poliomyelitis occurred, and in the control group eighteen cases, a rate of 2.1 per cent. and 2.9 per cent. respectively, the difference not being statistically significant. Moreover, the way in which the applications had to be made practically excluded the method from ordinary public health practice. That was the present position in respect of immunization to poliomyelitis.

Second Attacks of Poliomyelitis

In 1930 Still drew attention to the occurrence of second attacks in previously paralysed children. He collected nine or ten cases, and others had been reported. It was possible with monkeys to experiment with second attacks. Although poliomyelitis was not a natural disease in monkeys, when it was given to them artificially they were more severely affected than humans. The mortality among monkeys was about 90 per cent., which was far higher than the mortality in man. When the monkeys recovered—and a certain number by careful nursing could be made to recover—they had residual paralysis of a crippling character, just the same as human patients. A number of these monkeys were studied with reference to the possibility of second attacks.

It must be remembered, Professor Flexner pointed out, that when a disease was produced experimentally the methods used, as compared with what took place naturally, were rough; in other words, nothing comparable to the dropping of a suspension of filtered virus into the nose of monkeys occurred even under the worst conditions of an epidemic in human beings. Thus it was found that second attacks could be produced in monkeys much more numerous than in any circumstances one could imagine to occur in children. But what happened in the monkey was precisely what happened in the human patient. The process was the same, although the incidence might be very different. The virus, using the channel of the nervous system, entered the axons and extended widely. Any parasitic material thus introduced had an enormous advantage over the ordinary defence mechanisms, even when these were efficient, and in the monkey experiments the

virus passed by means of these nerve structures in the same manner whether or not the animal had had the disease previously. Thus a relatively high percentage of second attacks was recorded in monkeys. If the process was studied carefully it would be found that very soon after the virus was dropped into the nose a reaction would take place in the cerebrospinal fluid. This reaction consisted of a rapid increase in the number of cells. The increase began within forty-eight hours, and continued rapidly to quite a high level. This was of interest because the virus of poliomyelitis itself never entered the cerebrospinal fluid, at least it had never been found to do so, either in man in the natural disease or in the monkey artificially inoculated.

On the general subject of second attacks, it was supposed that such an attack in poliomyelitis never occurred at all. But there was no infectious disease, whether of bacterial or virus origin, no matter how strong the immunity, in which second infection did not exceptionally occur. It was only very recently that something had been learned about reinfection in poliomyelitis.

Epidemic Encephalitis

Professor Flexner added a few remarks on the subject of epidemic encephalitis, which appeared in this country in 1918 and in America a year later. It was originally described in 1917 in Vienna, and often went by the name of lethargic encephalitis or sleepy sickness. In the summer of 1933 about 1,000 cases occurred in Missouri, mainly aggregated in St. Louis, where the attack rate was about 1 per 1,000. It was quickly determined that this was a virus disease. At first it was transmitted to monkeys, and then after a little experimentation and the selection of particular strains of mice it was successfully transmitted to mice, an enormous advantage from the experimental point of view. A great deal had been learned about the disease as a result of the epidemic in Missouri. This type of encephalitis, known as the St. Louis type, was immediately recognized as having similarities with the encephalitis which was very prevalent in Japan, where about 7,000 cases were reported, some years earlier.

The question was whether epidemic encephalitis in the United States was the same as the Japanese disease. Plates were obtained from recovered cases of the Japanese disease and tested against the virus of the St. Louis disease, and Japanese workers had also made experiments in the reverse direction. It was shown that the two diseases were distinct, though this did not mean that they had no relationship. It meant only that the two particular varieties, the one causing the Japanese disease and the other the St. Louis, were distinguishable immunologically. In spite of all the obstacles to the production of immunity, natural or acquired, in animals or man, an impression of a sort was made on the structure of the nervous system. Something happened there—nobody knew what—which rendered that system less subject to reinfection with the same type of organism as that by which it was originally attacked.

Professor Flexner concluded with a quotation from Dr. Theobald Smith, an eminent American microbiologist, who wrote that "humility of spirit should hover over our undertakings. In nature everything is molten, living things are changing, nature is everywhere trying hundreds of experiments. . . . Out of this trial and error method come new diseases or new adaptations of existing ones." It was of great interest to note that before 1905 there was no historical record of poliomyelitis as an epidemic disease on a world-wide scale, and there was no historical record of the disease encephalitis lethargica which could be recognized at all.

* Owing to the time of going to press, Professor Simon Flexner was unable to see a proof of the above report of his lecture at Cambridge.

PROFESSOR SIMON FLEXNER AT CAMBRIDGE

LECTURE ON EPIDEMIC POLIOMYELITIS

Professor Simon Flexner, formerly director of the Rockefeller Institute for Medical Research, visited Cambridge on February 21 and lectured in the physiological department to a large audience, which included the Regius Professor of Physic (Professor J. A. Ryle) and Sir F. Gowland Hopkins. He was introduced by Professor E. D. Adrian. Professor Flexner took as his subject epidemic poliomyelitis or infantile paralysis, and at the end of his lecture dealt much more briefly with epidemic encephalitis. He said that he was led to speak on these two diseases because America had been the victim of them—especially of poliomyelitis—on a scale exceeding that of any other country. The two diseases were different in this respect, that poliomyelitis was one disease and encephalitis was not. How many kinds of epidemic encephalitis there might be was not known, but there were certainly two, and there might be more.

Landmarks in History

In briefly sketching the history of research in poliomyelitis Professor Flexner first mentioned the name of Jacob Heine of Kronstadt, who was the first to attribute infantile paralysis to a spinal cord affection. He was led to make a systematic study of the disease by reading a report of four cases by a practitioner of Worksop in England. Heine wrote a well-known book on the cases he had observed, which was published in 1840. Many years later Wickman suggested that the disease be called "Heine-Medin'sche Krankheit," and it was under that name that references appeared frequently in Continental literature. Wickman himself investigated an outbreak of 1,025 cases in Sweden in 1905, and in many ways the modern knowledge of the disease dated from Wickman's studies. The epidemic flourished in the remote and isolated parishes of Sweden, and Wickman was able to trace the movements of many of the children attacked and reached the conclusion not only that the disease was infectious and that it affected much more than the central nervous system but that certain varieties of it could be distinguished. He discovered also that the infection passed, not from children who were actively sick, but from slight cases which would never be suspected of the disease if they did not occur at the same time and in the same families as the paralytic form of the complaint.

By 1908 the disease had spread widely to other parts of Europe, and cases were occurring in the United States, on the Atlantic seaboard, where immigrants landed from Europe, and in Minnesota, where there was a large Scandinavian population. In 1909 at the Rockefeller Institute spinal cord was obtained from two fatal cases, and it became possible to accomplish animal-to-animal inoculation. One of the individuals who furnished this material had the initials "M. A.," and this accounted for many references in world literature to "M. A." or sometimes "M. V." This indicated the original virus, which was isolated about thirty years ago and which had been continuously passed from monkeys ever since. The filterable nature of the virus was established about 1910.

Mode of Infection

Once the filterable nature of the virus was discovered all the discharges from the body were examined with a view to detecting its channel of egress. By filtering the discharges and inoculating the filtrates, freed from all bacteria, into the monkey, it was discovered that the virus was present only in the discharges from the upper respiratory tract. No particular skill or imagination was required to try the reverse experiment and to discover whether the virus also entered by the nasopharynx. It was soon found that it was necessary only to get a suspension of the virus

into the nose and the disease developed. By a suspension of the virus he meant merely a portion of the spinal cord of the paralysed monkey suspended in solution and dropped into the nose.

The study of the manner in which the virus entered through the nose had opened a new chapter in pathology. It was quickly determined that it entered directly through the olfactory areas in the nasal mucous membrane. These were portions of the central nervous system having a peripheral location. Protruding into the cavity of the nose were hairs or receptors, perfectly free except to the extent to which they might be covered with mucus. When the virus was introduced into the nose it attached itself to these hairs and to the first line of olfactory cells immediately adjacent, and very quickly passed from these hairs and cells by way of the olfactory nerves through the axons to the olfactory lobe of the brain. It was important to bear in mind that owing to its portal of entry and means of discharge poliomyelitis fell into the class of upper respiratory infections. It was important because of the problems and difficulties surrounding the prevention of the diseases which had that origin. Poliomyelitis was therefore just as difficult to prevent as colds or pneumonia, which had the same mode of infection.

Prevention and Specific Treatment

The lecturer next turned to the efforts which had been made in the United States within the last year or two to bring about artificial immunization. Ever since the epidemic disease appeared in America every summer and autumn there had been outbreaks in one State or another or in Canada, and the number of children affected and left paralysed was so great that it was natural to direct every effort to prevent the disease. Two attempts were made, one in New York with a vaccine consisting of the virus to which a certain amount of formalin was added, and in the other a similar material was used, sodium ricinoleate being the addition. These vaccines had been used quite extensively, but both had been given up, the former because there was no particular evidence that it produced the immunity principle and the other because the indications were that it accidentally produced in certain sensitive children the disease itself. The peculiarity about all virus diseases was that, so far as was known, in no case would the virus produce an active immunity in the dead state. This was in sharp contrast to bacterial diseases. Bacteria grew on media which contained no living cells, but no virus would grow on dead materials. The virus was strictly cytotropic—that is to say, it required cells to which it attached itself in order that it might multiply, and unless the virus was alive it had no power of multiplication and no power to give immunity.

It was this requirement of a relationship between the virus and the living cell which determined the occurrence or non-occurrence of immunization. As the living virus of poliomyelitis could not be safely used for vaccination it did seem that for the time being the way was blocked for the artificial production of active immunity to the disease. Some degree of immunity could be produced by means of a mixture of the living virus and immune serum. The serum, which neutralized the virus, did not actually destroy it. The dissociation between the immune material and the virus could be made to take place outside the body, and it undoubtedly also took place in the body. A small amount of immune material carried in by the serum seemed to hold the virus in check; so that in those circumstances the disease was not produced. Unfortunately, however, the amount of immunity thus conferred was low.

Possible Blocking of Path of Ingress

The failure to produce active protection in this manner had led to another approach to the subject. The effort was made to block the passage of the virus along the path of the olfactory nerves. This work was begun with

for years, and about ten couples out of the hundred would remain childless. Absolute fertility meant physiological perfection, a state which was common in animals, but human beings in comparison with animals were poor breeders, relatively but not absolutely fertile. In matings of high fertility in human beings pregnancy occurred promptly and repeatedly, even in spite of all contraceptive precautions, but if the fertility of the mating was average a desired pregnancy could easily be accomplished within a reasonable time and an undesired one prevented by contraceptives. This conception of relative fertility as applied to human matings was a comparatively new one and had done a great deal to clarify the whole subject.

In the causation of infertility a number of infertility factors of major and minor importance were recognized. The investigation of a childless marriage entailed an exhaustive examination not only of each partner but of the sum total of infertility factors found in both. The usual problem was not that of one sterile and one fertile partner, but rather of two individuals, both of whom exhibited some degree of infertility. Meaker in the United States had found in one hundred cases of sterile marriage 481 infertility factors, one-third of them on the male and two-thirds on the female side. In the experience of most of them, in about 40 per cent. of sterile marriages the semen showed some obvious defect, though such a finding was no justification for fixing the blame exclusively on the husband, because in most cases the wife also exhibited some infertility factor. The male factor might be defective spermatogenesis or some blockage in the male genital tract. Of these the first was the more important. It was due to constitutional causes which in the male preponderated over the local ones. Among them might be mentioned pituitary or thyroid dysfunction, malnutrition, and alcoholism. The female factors might also be divided into constitutional and local. Far too much importance was attached as a local factor to tubal occlusion, which he had not found in more than 10 per cent. of cases. Genital hypoplasia or failure of complete development of the reproductive system was by far the commonest cause of sterility in the female. It was a common estimate that 30 or 40 per cent. of all sterile women showed stigmata of genital hypoplasia. The tragedy about this condition was that medical advice was sought too late in life. If a girl did not menstruate regularly and normally before her fifteenth birthday her general health and endocrine functions should be investigated. If the delay extended to her sixteenth birthday the matter was really urgent. The aim of the members of the medical profession should be to detect the candidates for genital hypoplasia even before they reached the age of puberty. In Italy Mussolini had already established centres for hormone investigation of this sort, especially with a view to detecting incipient hormone defects.

Influence of Changes in the National Diet

Professor J. C. DRUMMOND discussed the changes in the character of the national diet with their bearing on nutrition, and possibly on fertility, having in mind the likelihood of a shortage of vitamins B₁ and E. The latter vitamin was known to play a very important part in the reproductive cycle. No fallacy was more widely held than that a mixed diet afforded protection against all forms of dietary deficiency. The vitamins were quite erratic, and it did not necessarily follow that with a mixed diet one was making good the deficiencies of one food with the adequacies of another. If a list of common foodstuffs were made curiously few of them would be found to be rich in vitamin B₁ or E, but there was one food in which they were both present to a considerable extent—namely, the germ of most of the cereals. If as he imagined, the decline in the population first became apparent about fifty or sixty years ago, the period did coincide with the change-over from wholemeal to white bread, which occurred very rapidly as a result of the introduction of the roller mill. The removal of the germ which the new

process made possible brought about in less than thirty years a sharp fall in the amounts of these vitamins in the everyday diet. For example, the intake of a poor person living largely on bread fell from about 800 international units daily to about 250. He considered it possible that the introduction of white germ-free breads had been in part responsible for lowered fertility.

The Part Played by Abortion

Professor J. YOUNG said that abortion and contraception were generally believed to constitute the effective influences in the declining birth rate. In a survey of gynaecological cases Beckwith Whitehouse found a history of 1,972 abortions in 11,430 pregnancies (17.2 per cent.). This estimate, however, was overweighted by the nature of the clinical material with which he had to deal. In a survey of the reproductive history of 365 women in a medical unit there were 137 abortions in 1,265 pregnancies (10.8 per cent.). From a medical standpoint abortion was sharply divided into two separate entities: criminal or intentional, and spontaneous or pathological. There were no accurate data with regard to the relative proportion of these. Raymond Pearl, after an investigation carried out in Chicago and New York, declared that current statements about the frequency of criminal abortion considerably exaggerated any conclusion that could be supported by critical scientific evidence. In England and Wales over the period 1928-35 there was no evidence in the Registrar-General's figures of any appreciable increase in the mortality from abortion, but the returns of the Ministry of Health, obtained in a different manner, showed a rise in mortality of nearly 80 per cent. in five years. Criminal abortion was to be regarded as a problem more for the sociologist and the publicist than for the doctor. As for spontaneous abortion, this was of the greatest importance to the medical profession in that there was increasing evidence that it arose in a significant degree from factors which were controllable. From two sides there was evidence that dietetic factors might be concerned—namely, the success obtained in investigations on vitamin E and the high proportion of developmental defects found in aborted ova of such a kind as might be ascribed to nutritional deficiency.

Economic Factors

Sir LEONARD HILL remarked on the ageing of the population in this country, the decrease in the number of children, and the greater longevity of old persons. For many years now all the energy had been put into the prevention of death, not into the production of young life. Probably by making people live to a greater age the fertility of the race was being reduced. Birth control undoubtedly was at the bottom of the diminution of the birth rate. There were shops in every street selling contraceptives. Books had been written in popular form making the methods of birth control familiar to all young people. He urged the medical profession to appeal to statesmen to apply at once the methods used with success in Germany and Italy, including family allowances, given both in additions to wages and reduction of tax, dowries for marriage, bonuses for children, the establishment of crèches where mothers could leave their children, the removal of all disabilities attaching to illegitimacy, and the prohibition of the inclusion among conditions for employment that the candidates must be unmarried. "The writing is on the wall, and in the far distance the vultures are getting ready to swoop down on dying England."

The PRESIDENT (Professor Phillips) said that among his private cases he had noticed in the course of years an increase in the number of consultations on account of sterility. Thirty years ago the proportion of such cases to the total consultations was 0.8 per cent.: the last figure was 6.6 per cent. One fact which gave ground for apprehension, to his mind, was the increasing number of cases

Reports of Societies

MEDICAL ASPECTS OF DECLINE OF POPULATION

At a meeting of the Section of Obstetrics and Gynaecology of the Royal Society of Medicine on February 18, with Professor MILES PHILLIPS in the chair, a discussion took place on the medical aspects of the decline of the population.

Multiple Causes of Declining Fertility

Professor A. M. CARR-SAUNDERS, in opening, said that in many countries of North-West Europe the decline had been in the neighbourhood of 50 per cent. within the last sixty years or so. It was clear that there might be many causal factors operating at the same time, and he proceeded to a classification of them. The first was a possible decrease in the natural capacity for child-bearing, meaning by "natural" an inherited capacity. It was conceivable that less fertile varieties might become more numerous either by selection or mutation. At the same time he could not think that this kind of cause had been seriously operative within the last two or three generations. The second possible cause was a decrease in intercourse, including decline in marriage and restriction in the frequency of intercourse between married persons. There had been a tendency to more rather than to less marriage during the period of declining fertility, but as to frequency of intercourse there was, of course, no direct information. The third factor was that, while intercourse occurred, conception did not follow either by reason of contraceptive measures or consequent upon certain physiological conditions. It was possible that modes of life might have altered during the period in question, and that the conditions had become such that conception followed intercourse less frequently than in a former time. The fourth possible factor was that while intercourse was followed by conception no living births took place by reason of either abortion or miscarriage, and again either deliberately or consequentially upon changes in the mode of life. He contented himself with stating the possible factors, leaving others to discuss their relative importance.

Statistics of Childless Marriages

Dr. R. R. KUCZYNSKI said that the number of childless marriages in England was not known, and even if it were known most people believed that the proportion of voluntarily childless marriages could not be estimated. That, however, was a mistake. The number of involuntarily childless marriages was so small that if there were adequate statistics of all marriages which had no issue it would be possible to estimate the number of voluntarily childless. The proportion of wives marrying under 30 who remained childless could be estimated for those who married in England between 1896 and 1901 at 8 per cent., for those who married in Norway between 1921 and 1924 at 8 per cent., and for those who married in Germany between 1924 and 1926 at 16 per cent. In Germany, according to the census of 1932, 10 per cent. of the women who had been married for from ten to fifteen years and whose age on marriage was below 25 remained childless, and in German statistics the "childless" women did not include those who had had a stillborn child. Assuming that in each of the cases just quoted the proportion of involuntarily childless wives was 5 per cent., the proportion of voluntarily childless women among the fecund women who married under 30 would have been about 3 per cent. for England and Norway and about 12 per cent. for Germany. In France the proportion of childless marriages seemed to be about as low as in Norway, while in Austria it was apparently much higher than in Germany. Whether

in England the proportion of wives marrying under 30 who remained childless was still 8 per cent. or 16 per cent., or even 24 per cent., it was impossible to say. It would also be a mistake to think that a few years hence, when the first statistics based on the records obtained under the new Population (Statistics) Bill would be available, much more would be known about childlessness in this country. The statistics should be supplemented by triennial or quinquennial fertility censuses, the first of which ought to be taken within a year.

Medical and Eugenic Deterrents

Dr. C. P. BLACKER, secretary of the Eugenics Society, said that the medical causes of declining fertility could be divided into three groups: (1) sterility in men and infecundity in women, giving rise to the incapacity to conceive; (2) various degrees of ill-health in men or in women, giving rise to a disinclination to have children; and (3) various abnormalities which might cause a miscarriage. The medical student was brought up to consider the various contraindications to pregnancy in women, and the deterrents in men were overlooked. Moreover, in women it was mainly the grave disorders imperilling the life of the woman, such as cardiac or renal disease, which were considered, and the minor degrees of ill-health, which though seldom acting as a single deterrent played an important part along with other deterrents, were forgotten. In any remedial measures taken with a view to stimulating fertility some would have to be included which had for their object the safeguarding of the health of the woman and offering facilities for the treatment of minor disorders—such, for example, as varicose veins. So far as men were concerned, ill-health or physical abnormalities had an important effect in determining the economic attitude towards procreation. These health reasons were particularly operative when the occupational stability was threatened.

The relative effect of the various deterrents was difficult to evaluate. Much was made in the Press of the "cannon-fodder" argument. This argument was very likely to be brought forward on first asking the woman about the reasons why she was disinclined to have more children, but subsequently, after she had discussed the matter with her husband, it took a very much smaller place among her objections, and was nothing like so important in general as the newspapers made it out to be. Eugenic deterrents must not be overlooked. In perhaps nearly all pregnancies the thought occurred to the prospective mother, "Supposing the child were deformed or defective." Some of them would take almost fantastic measures to protect themselves against "psychic trauma." In families where a hereditary abnormality was known this anxiety might be exalted into a positive deterrent, and it was possible that a misplaced eugenic zeal at the present time was seriously operative. In the majority of such cases in which he was consulted he had been able to counsel the prospective parents, after looking at both of them and into the family history, to take the risk. After all, if every pedigree were examined few people might be inclined to have children. Every family had genetic skeletons in its cupboard, and it was not well to be over-sensitive. Dr. Blacker mentioned that a questionnaire had been designed by the Population Investigation Committee, of which Professor Carr-Saunders was chairman, and it was hoped that this would be of use to the medical profession in giving guidance in these cases.

Medical Causes of Inherent Sterility

Mr. EARDLEY HOLLAND, in discussing the medical causes of inherent sterility and their relative importance, said that if one hundred couples married and had regular intercourse without the use of contraceptives the results might be predicted as follows: in a minority pregnancy would occur immediately; in a majority it would occur after a variable period of delay from a month to a year; in a few cases it would be delayed for a longer period, perhaps

and sinuses played a limited part in aetiology. Certainly tenectomy usually failed to bring about any relief of the pains.

Was there a type of child specially susceptible to rheumatic pains and the effects of climate? Although leg and other pains of a more or less localized nature might occur in obese children, the large majority of rheumatic subjects were thin, highly strung, and nervous. When in good health these children were noticeably high-coloured. Capillary stasis was specially marked on exposed parts when the subject was in damp or cold surroundings. Reaction to the sun's rays was peculiar; the skin became erythematous, but did not pigment easily. Many so-called general limb pains if analysed proved to be in reality a collection of local pains due to strains of various origin; acute strains of the foot due to some unaccustomed exercise came into this category. Dr. Pearson concluded with a few remarks about postural deformities and abnormalities without pain but with hypotonic muscles as opposed to painful hypertonic cases.

Pain and Spasm in the Muscles of the Back

Dr. NINA KELLGREN, with the aid of a child subject, dealt with specific examples of cases in all these categories, discussing the nature of the physical signs and their causes and outlining treatment. Muscular and ligamentous strains in children often produced no symptoms other than general fatigue, and it was only in the more acute forms of strain that pain was produced. She discussed in particular pain with localized spasm of the muscles of the back. These cases were like those of fibrositis in adults. In children there was often an acute tender area in the neighbourhood of one or more of the spinous ligaments, with pains referred along the course of the anterior division of the spinal nerves, and some spasm or tenderness in the muscles close to the spine, with or without scoliosis. The muscular spasm was not always on the same side as the pains referred around the trunk. She believed the muscular spasm to be secondary, the primary lesion being the fibrous tissue closely associated with the spine. She never used an anaesthetic for mobilizing the child's spine; the manipulation was generally painless, and she had never made a child cry. She demonstrated these movements, showing how everything could be done with the application of practically no force at all. She drew attention to an article by Dr. R. G. Abercrombie in the *British Medical Journal* of January 29 (p. 215) on the pathology of adolescent scoliosis. Dr. Abercrombie's experience with adolescent girls was very similar to her own with younger children. She agreed with him that long-continued muscular contraction could produce postural deformities. Education in muscular relaxation was a very important part of the treatment of children with hypertonic muscles. They were highly strung and self-conscious children, who did not usually complain of pain, but were obviously sickly, and on undertaking passive movements there was a general resistance.

Faults of Posture

Dr. J. B. MENNELL said that the reason for much strain and breakdown was faulty posture. He directed special attention to the foot, calling attention to some common fallacies. Many people were considered to have flat-foot because when they put their foot on the ground they had no marked arch; in the Russian ballet every dancer had a completely flat foot in the rest position. In itself flat-foot was not a deformity, but it could become one when it was due to a short tendo Achillis. Much was heard about the anterior metatarsal arch. Was there such a thing? The metatarsal heads rested on the ground when walking. Dr. Mennell gave a demonstration of the mechanics of the foot. He asked was there any explanation of the osteoarthritic hip except injury in younger days not adequately treated at the time? Any injury of a joint remaining untreated meant that later in life that joint might be ten or fifteen years older than the others. In

discussing general fatigue little was said about the portal circulation. These tired and weak and worn-out persons, nine times out of ten, were lacking in adequate muscular tone in the portal area. There was, so to speak, a bleeding into the portal area, depriving other parts of their blood supply. The importance of elasticity in the very young child had been brought home to him when he attended for a slight injury one of a Lambeth family of acrobats. He learned that unless in that family a definite training began at the age of two the individual could never become a first-class acrobat. By the age of three elasticity had so much diminished that his chances in the acrobatic world were seriously qualified. The effect of concealed injury was illustrated in the case of a child who had been for months under psychological treatment for sudden and uncontrollable attacks of temper. At some earlier date she had fallen from a horse on to the head, and examination now showed that the joints of the cervical spine had been injured, so that on movement the child experienced pain in the back of the head and lost its temper. As a result of appropriate treatment of the cervical injury the whole psychological outlook of the child was altered.

DEEP X-RAY THERAPY

A discussion on "What can be expected of deep x-ray therapy" took place at the meeting of the Medical Society of London on February 14. Mr. J. E. H. ROBERTS presided.

Dr. J. H. DOUGLAS WEBSTER reviewed the various non-malignant and malignant conditions in which deep x-ray therapy had been found of some use. Among non-malignant conditions he mentioned benign hypertrophy of the prostate, relatively few cases of which, he said, had been submitted to x-ray therapy, but in his own experience the treatment had proved often successful. In agranulocytosis a number of good results had been recorded following stimulation of the bone marrow by very small doses of x rays. Many cases of carbuncle also had yielded to this form of therapy. Within two or three hours of the treatment the patient was usually worse, but within twenty-four hours the condition became limited, and often cleared up with a small incision. Deep x rays was one of the best means of alleviating conditions such as leukaemia. Operation was the method of choice in operable cases of cancer of the stomach, colon, rectum, and gall-bladder, and probably of the kidney, though many renal cases would be better for a pre-operative irradiation, and the same applied to carcinoma of the bladder. Radiotherapy was the method of choice in cancer of the skin, lip, mouth, pharynx, larynx, cervix, penis, and testes, also in Ewing's and one or two other sarcomata and lympho-epithelial carcinomata. A combination of radiotherapy and surgery was probably advisable for cancer of the nasal passages, antra, and sinuses, some cases of breast cancer, bone sarcomata, and perhaps prostatic and testicular cancer. Dr. Webster was unable to subscribe to the view that the increasing of x-ray voltage until a quality of radiation was obtainable as high as, or higher than, that of radium was likely to offer a better method of treating malignant disease than the ordinary deep radiotherapy installations, and this was borne out by an American authority.

An interesting observation made by Dr. Webster was that the first sign of recurrence in a number of cases of breast cancer was invariably at the thirty-third week after the previous treatment. The same periodicity was found to hold good for a number of malignant conditions in the mouth and at other sites, also in leukaemia and Hodgkin's disease. Some patients showed, instead of a thirty-three-week period, a period of four lunar months, or half the full period. The ascertainment of such periodicity had its practical value, because it enabled one to instruct the patient to return for examination at the time the first indication of recurrence was due.

of people who had been married for from three to five years and had practised various methods of contraception and had then discovered that conception when desired did not occur. The use of contraceptives was often associated with disturbance of the menstrual function. While he could see the advantage of contraception and the spacing out of births, nothing would prevent him advising the newly married couple to have their first baby as soon as possible. One consideration not often regarded was the cost of childbirth for that section of the community among whom a higher birth rate was most desirable. He suggested that the obstetrician might charge a diminishing fee for each successive child in a family; he had even made a "sporting offer" to attend the fifth child for nothing. Childbirth must not only be made safer but cheaper.

Many Opinions

Mr. J. M. WYATT, on the dietary question, pointed out that Germany ate wholemeal bread, and yet according to the figures that was where there had been the greatest fall in fertility. Dr. G. ALABASTER also asked how it was, if the wheat question was so important, the Eskimos had not "faded out." Dr. BINNIE DUNLOP said that in this country the statistics showed that the birth rate had fallen principally among those who had always enjoyed a liberal diet.

Dr. J. M. BRYDONE quarrelled with what had been said about medical causes of declining fertility. It was unwillingness to bear children, not incapacity, which was at the root. The vast majority of couples wished to have one or two children, but not more. Medical reasons for not having more did not exist so far as they were concerned. The difficulty was financial. They did not want to have such a number as would lower for their children their own level of upbringing.

Mr. ALECK BOURNE questioned whether the measures adopted in Italy and Germany were genuine in their effect. They might result in a temporary increase of the birth rate in respect of families where it had been intended to have more children had passing economic circumstances not been adverse, but he doubted whether they would have a permanent effect. He could not discover any evidence that contraceptive measures during the early years of marriage were the cause of sterility. He thought this suggestion to be rather like the ogre which the nurse shook in front of the naughty child. He could not see why defective ovulation, which was the chief cause of female sterility, was likely to be increased as a result of the use of contraceptives. One real trouble was that of housing, also the trend of social custom, which was all opposed to the bearing of children. The income of the family was mortgaged to pay for instalment purchase of the house, the car, the piano, and perhaps the perambulator for the first and only baby. No one had mentioned the chief cause of all why the birth rate was falling—because the women of to-day wanted to have a better time than to spend the whole of their lives in pregnancy and lactation.

Dr. B. P. WIESNER suggested that a greater effort might be made to reduce the incidence of miscarriage, and pointed out that if this were done it might have important social consequences. It would not only save children who would otherwise remain unborn, but it would reverse the sex ratio, for the proportion of males was much greater than females among children who would have been born but for miscarriage. Instead of slightly over 100 male births to 100 female there might, if more energetic measures were taken to prevent abortion, be 130 or 140 boys born to 100 girls. Dr. G. F. MCCLEARY pointed out that in France the population began to decline long before it did in England. He was a little sceptical of the stress laid on housing conditions as a factor, and pointed to the extraordinary variety of sociological conditions obtaining in countries where fertility had fallen. It illustrated the danger of premature conclusions.

One speaker had been interested enough to look up the families of 100 recently deceased persons who had left large fortunes. The fortunes left amounted on the average to over £300,000. One-third of these people had hereditary titles, so that there was a special encouragement to maintain the family. These 100 persons had produced only 233 children—2.33 per married couple. Dr. E. STOLKIND remarked on the relative lack of fertility among doctors and clergymen. Dr. COOPER, who had used the questionnaire prepared by the Population Investigation Committee, said that among 300 married couples he had investigated only three gave as a reason for, not having children the "cannon-fodder" argument. Very

many of them were chiefly concerned that their children should have a good opportunity, and preferred to do well for two instead of not so well for three. He had also been struck by the extent to which birth control measures were used, but again by the number of people, not only Catholics, who would not use them in any circumstances.

Another suggestion which came from the audience was that a reason for declining fertility might be found in a certain alteration of mating conventions, so that more women of a neurotic type and less likely to bear children were marrying, while women adapted to bearing children, again owing to change in mating conventions, were remaining spinsters. The point was also made that for the working-class population the economic advantages of having children had diminished; children were rather a liability than an asset; and the speaker suggested that this position would continue until the State endowed parenthood.

The last of some twenty speakers was Dr. LETITIA FAIRFIELD, who pointed out that the desire for children as an economic factor had been taken away, while the emotional desire for children was satisfied with a smaller number. She also expressed the hope that the methods of despair which Sir Leonard Hill had advocated would find no acceptance. What was not wanted was a Nazified nation or a community of children without fathers. It was at least as important to have an appreciation of the true values of parenthood and children as it was to have more children born.

EFFECTS OF STRAIN IN CHILDREN

At a meeting of the Section of Physical Medicine of the Royal Society of Medicine on February 18, with Dr. F. D. HOWITT in the chair, a discussion took place on the effects of strain in children.

Muscular and Ligamentous Strain

Dr. WILFRED PEARSON limited his remarks to muscular and ligamentous strain, foregoing the consideration of joint affections. He said that the effect of strain might be demonstrated by pain of a general or local character, or there might be no symptoms except those of fatigue. As strain and apparent rheumatism were so closely related it was necessary to consider the type of child who was specially prone to rheumatic pains and muscle spasm. Aches and pains in the limbs with indefinite ailing or debility, sometimes associated with repeated sore throats, were often termed cases of subacute rheumatism—a term apt to be misleading. There were three classes of cases to be considered: those in which there was some disease or intoxication other than acute rheumatism; those which at the time or later gave evidence of specific rheumatic infection; and those with no obvious association except that of variation with climatic conditions. "Growing pains" were most common in the leg, but they also occurred in the arms and around the abdomen and chest, often localized over the attachments of ligaments and muscles; the commonest age was between six and ten. In more than half the cases the pains were related to atmospheric changes; damp and draughty houses and residence in low-lying neighbourhoods along old water-courses also came into the category of predisposing factors. Sultry, thundery weather accentuated the pains, which were worse towards the end of the day, consequent upon fatigue. Although warmth alone could relieve many cases, some of the subjects endured worse pains after going to bed. The milder cases were usually relieved by sleeping between blankets. Most of the children in whom fatigue played a part were thin and debilitated. The fatigue element was most marked during periods of sudden and excessive growth, as between the sixth and eighth year and in the early teens. The part played by infection was difficult to assess. The throat at times might show general redness and dryness, but not necessarily indicating infection; these changes were possibly part of a systemic disturbance producing an alteration in the vascularity of the mucous membrane. Even in such cases, however, certain climatic conditions repeatedly induced a state of ill-health. On the whole it seemed that infection of throat

SOLITARY DIVERTICULITIS OF THE CAECUM

At a meeting of the Liverpool Medical Institution on February 3, with the president, Dr. E. GILBERT BARK, in the chair, Mr. M. J. BENNETT-JONES read a paper on solitary diverticulitis of the caecum.

Four cases of primary solitary diverticulitis of the caecum were described, and specimens were exhibited. The cases were reviewed together with the seventeen previously recorded cases in the literature. This disease differed from the better-known diverticulosis of the colon in its age and sex incidence. It often occurred in young adult males and females, while diverticulosis was almost unknown before the age of 40 and was much more common in males. Although Odguist and Petró had described a large congenital diverticulum of the caecum, it did not follow that every solitary caecal diverticulum with a complete muscular coat was necessarily of congenital origin. Cases of this rare disease often simulated acute appendicitis, but might appear malignant when the abdomen was opened. It was likely that many cases had been unrecognized because abscesses in the right iliac fossa were invariably attributed to the appendix. Diverticulitis was always considered in the differential diagnosis of carcinoma of the pelvic colon, but rarely in disease of the right iliac fossa. The operative procedures that might be necessary varied between mere excision of the diverticulum, closure of a perforation, excision of the diverticulum with a part of the caecum, and radical excision of the right side of the colon. The last-named procedure was successfully undertaken in one of the speaker's cases. The true pathology had been recognized at operation, but there was a previous history of intestinal obstruction, some stenosis of the gut, and a large inflammatory mass involving the posterior abdominal wall due to perforation of the diverticulum.

A number of pathological specimens were demonstrated and described at the same meeting. Among those taking part in the demonstrations were: Drs. H. S. PEMBERTON, R. H. MOLE, R. OGILVIE GIRDWOOD, and T. F. HEWER.

ADLER'S CONTRIBUTION TO GENERAL MEDICINE

At a meeting of the Medical Society of Individual Psychology, at 11, Chandos Street, W.1, on February 10, with Dr. H. C. SQUIRES in the chair, a paper was read by Sir WALTER LANGDON-BROWN on the contribution of Adler to general medicine. This was the last of a series of four papers forming a symposium on the work of the late Dr. Alfred Adler.

The lecturer, after paying a tribute to Professor Adler's memory, referred to the chairman's suggestion that papers should be the expression of personal experience and opinion. Accepting that suggestion, he reviewed his own gradual approach to the Adlerian conception through biology and physiology; on the one side the sympathetic nervous system, on the other the endocrine glands; behind them both the hypothalamus as the centre of emotional expression began to assume increasing importance, since it was able to operate through either and in its turn was connected with the prefrontal cortex. Here was mapped out a route by which psychical states could be reasonably expected to produce physical symptoms. When the life of external relations was frustrated, the *élan vital* was thrown back on to the more primitive life of internal relation. Hence frustration often expressed itself in disturbances of plain muscle in the direction either of atony or of spasm. He gave several illustrative cases, recalling that many disturbances of the colon were not an inflammatory colitis at all, but the expression of a loveless and childless life. He next discussed the increasing incidence of anorexia nervosa, attributing it to the increased frequency of tension between mother and daughter, the

fashionable fear of obesity, and the fear of going out into a world fiercely competitive in work and games alike. The disturbances of the climacteric were then considered in terms of the sympathetic-endocrine apparatus.

Civilization and Disease

Attention was called to Dr. C. P. Donnison's book, *Civilization and Disease*, which brought out and explained, largely on Adlerian lines, the close aetiological relationship between hyperpæsis, diabetes, Graves's disease, and peptic ulcer. There was hardly an aspect of medicine which had not undergone some change as the result of Adler's teaching. When he linked psychoneurosis with organ inferiority, Adler enabled orthodox medicine to join hands amicably with the new psychology. Even though organ inferiority subsequently retreated into the background of his teaching, the bridge had been built. He emphasized Adler's distinction between a feeling of inferiority and the inferiority complex, in which he limited the latter to the non-cooperative retreat from life's responsibilities, and concluded by a brief reference to the ethical outcome of Adler's teaching.

There was a large audience, and an interesting discussion took place in which Drs. CRICHTON MILLER, GEORGE GORDON, BEVAN-BROWN, C. BRASHER, M. MARCUS, J. C. YOUNG, J. C. BAKER, HILDA WEBER, and O. WOODCOCK joined. Sir WALTER LANGDON-BROWN then replied to the various questions raised.

HEALTH OF THE COAL MINER

At the last meeting of the Association of Industrial Medical Officers, held on January 28 in the London School of Hygiene and Tropical Medicine, with Dr. L. P. LOCKHART in the chair, a paper on "The Health of the Coal Miner" was read by Dr. S. W. FISHER (H.M. Medical Inspector of Mines).

Dr. Fisher discussed in general terms the problems of the present-day coal mine in relation to health, both from the point of view of environment and specific hazards. The average number of persons employed in the coal-mining industry during the year 1936 was 767,100—about 2,400 less than in 1935, and nearly 190,000 less than in 1929.¹ Of these persons the great majority were subjected in some form or other to factors which tended to produce incapacity for work. Dr. Fisher next described the common features of the structure of the coal mine and various points to do with working conditions underground, physiological and psychological. In discussing specific diseases to which the miner might be liable he mentioned in some detail silicosis, nystagmus, beat hand, elbow, and knee, and infective jaundice. He outlined the present-day theories regarding the causation and pathology of silicosis, and showed how important it was as a cause of serious disability in mines, particularly in South Wales. With regard to miners' nystagmus Dr. Fisher discussed its international incidence, aetiology, and treatment. He showed how modern methods of lighting in mines were definitely preventing its occurrence, and demonstrated the different types of lamp which had been used by the miner in the past and up to the present day. It was interesting to note, he said, how the methods of providing illumination in mines were intimately associated with safety, and he welcomed the fact that over the past few years the number of electric cap lamps used by miners had much increased at the expense of hand lamps.

Safety Measures in Mines

Dr. Fisher discussed in considerable detail the causation and prevention of accidents in mines, illustrating his remarks by lantern slides. He demonstrated various types of rescue apparatus, and told something of the work of the Mines Department on safety measures. Finally Dr. Fisher dealt with the question of carbon monoxide

¹ Annual Report of H.M. Chief Inspector of Mines for 1936.

Radiosensitivity

Dr. W. M. LEVITT said that if they took as their standard of cure a total disappearance of clinical evidence of disease and its continued absence for five or ten years, there was abundant evidence that certain varieties of cancer might be cured by x-ray treatment. Of the several factors which influenced the result of x-ray treatment in cancer the most important was the radiosensitivity of the tumour. Such growths as lymphosarcomata, lympho-epitheliomata, and the less-differentiated squamous-celled carcinomata could be made to disappear locally by doses of x rays that did little or no damage to the normal tissues. On the other hand, fibrosarcomata, most periosteal carcinomata, carcinomata of the bowel, and the highly differentiated squamous-celled carcinomata were all radio-resistant, and required for their destruction doses of x rays that would not be tolerated by normal tissues. Another factor was the accessibility of the growth to treatment by irradiation. Thus the treatment of most skin growths could be regarded as a trivial matter, while the treatment of a similar growth in the mid-oesophagus was quite a serious undertaking. Palliative treatment by x rays in malignant disease fell roughly into two classes—first, that in which the x rays were applied for relief of an urgent pressure symptom; and, secondly, that in which temporary regression, more or less complete, could be obtained of the growth and of the symptoms which it was causing. The first class consisted mainly of cases with pressure from growth or glands on the trachea, oesophagus, or vena cava. As to the second class, it might be taken as a general rule that patients with multiple secondary deposits were unsuitable for this type of palliation; but there were two types of case with isolated secondary deposits that gave very good palliative results. One was the case with secondary deposits of carcinomata in bone, and the other the case of lymphosarcoma. On the "debit" side of x-ray treatment were the discomforts and in some cases the suffering inflicted by the treatment itself. In his opinion only a good hope of cure or at least of palliation for some years could justify the infliction on patients of the reactions which followed the treatment of disease in the mouth and throat. He did not advise x-ray therapy at all in cases of carcinoma in the throat with secondary glands in the neck, except when the primary was in the palate or post-nasal space. In prostatic and bladder cases the reactions, though not so severe as in the throat cases, were of sufficient severity, but he thought carcinoma of the prostate was worth treating in an otherwise favourable case.

Glandular Enlargements

Dr. G. VILVANDRÉ said that the enlarged glands of lymphadenoma, whether of the neck, abdomen, or groin, responded readily to x-ray treatment, and usually within two or three weeks a mass of glands would diminish and disappear when subjected to proper x-ray treatment with filtration, but such results were obtained for many years before deep therapy came into use. The ready response of such glandular masses to irradiation could also be used as a means of differential diagnosis. Patients suffering from Hodgkin's disease benefited from x-ray treatment, and even when pleural effusion was present they were definitely helped. The disease was not cured by x rays, but the patient was made more comfortable and as a rule his life was prolonged. He had seen good results follow the treatment of tuberculous glands of the neck provided they were not caseous, in which case they should be treated surgically. X-ray therapy would reduce the size of an enlarged spleen, but it would not cure the myelogenous leukaemia from which the patient was suffering. There was no doubt as to the efficacy of deep therapy in the treatment of some gynaecological conditions, and his main consideration and interest lay in the treatment of fibroids and excessive haemorrhage at the menopause. Blended, weak patients, too ill to stand, would, as a

result of x-ray treatment, recover good health and efficiency within a few months. In osteo-arthritis really useful results could be obtained. The function of the joint was restored and pain allayed. In malignant disease of the thyroid the results of deep therapy might be as brilliant as they were unexpected. Malignant adenomata and papillary adenocarcinomata were said to be more radiosensitive than the rapidly growing cellular types of carcinoma. Hard carcinomatous glands of the neck had never responded satisfactorily to deep therapy. With regard to breast cancer, even given the same type of malignant disease one could not expect to get the same results in every patient. Two patients of the same age, presenting the same clinical features and histologically the same type of growth, would react entirely differently to x-ray therapy. In reply to the plain question, "Can deep therapy cause the complete disappearance of a breast carcinoma?" his answer was in the affirmative in some instances.

After-results

Sir JAMES WALTON brought forward certain statistics relating to the treatment of cases of carcinoma of the breast and of the thyroid. The figures were not valuable in the absolute sense, but only as comparing the results of surgery and radiotherapy. Moreover, he had not given the radiologist a "fair deal," because only the worst cases—those entailing serious operative risks—were sent to the radiologist. Since a special follow-up system, which he described, was started he had treated 201 cases of carcinoma of the breast by operation only. Of this number sixty-six patients had died—thirty-seven of them of recurrence within a year—but a number had lived for several years, and seventy-five were still alive and well; of this group twenty-one dated back for three years, and others for longer periods, even up to seventeen years. The patients operated on in whom the condition had recurred and had been treated by x rays numbered forty-four, of whom thirty-seven had died, and seven were alive and well, one of them seven years after the treatment. Eleven patients were not operated on but sent direct for x-ray treatment, and of these three had died and eight were alive and well. His cases of carcinoma of the thyroid numbered thirty-two. Twelve had had surgical treatment only; four were dead, five alive and well, and three had been lost sight of. Those patients operated on who had subsequently had a recurrence treated by x rays numbered eight; five had died, and three were alive and well. Nine others had been treated by x rays only, and seven of them had died, all within the first year. Sir James Walton said that he was conscious of the inadequacy of these statistics because he had had to lump together among the survivors those who had had treatment only a few months previously, and among some of whom recurrence was probable, and those whose immunity had lasted for several years.

Mr. J. E. H. ROBERTS suggested that in some cases treatment by x rays precipitated the dissemination of the growth. It had been suggested that irradiated cancer cells underwent a process of autolysis, and those not killed were swept away by lymphatic spread to other parts of the body. With what frequency did such dissemination occur, and how soon did it arise after x-ray treatment had been given? Mr. WILLIAM INNOTSON asked what was the effect of treating a malignant growth to which was superadded an active syphilis. Sir WILLIAM WILLCOX mentioned the value of x-ray therapy in persistent sciatica and in brachial neuritis. Dr. DOUGLAS WEBSTER could not agree with the president's suggestion that radiotherapy was empirical. As to the passage out of the cells into the lymphatic stream, they did that in any case, apart from x-ray treatment. With regard to active syphilis, he recalled one case of cancer of the tongue which had a syphilitic indication, and which responded to treatment more slowly than other cases of its kind.

of the Departmental Committee on Health Services had recommended closer co-operation among local hospitals, but there had been no comprehensive legislation based on this, and the case for co-ordination of hospital services was stronger to-day than when the committee reported. Voluntary hospitals in Scotland now proposed to make representations to the Government to speed up a decision on the Departmental Committee's recommendations. The report of the Infirmary showed that the ordinary revenue of the hospital had fallen short of ordinary expenditure by £29,344, the ordinary expenditure having been £127,431. Subscriptions from wage-earners generally amounted to £30,290, and legacies and donations, out of which the deficit on ordinary revenue had been paid, to £45,637. The Blind Asylum buildings adjoining the Infirmary are being reconstructed to provide a new out-patient department.

IRELAND

Medical Research Council's First Report

The Medical Research Council, which was incorporated on January 26, 1937, has issued its first annual report. The members of the council were: Professor R. P. Farnan (chairman), and Professors J. W. Bigger, J. F. Donegan, W. J. E. Jessop, H. F. Moore, T. G. Moorhead, John McGrath, J. M. O'Connor, and J. M. O'Donovan. The report states that a sum of £10,000 was allocated to the council by the Minister for Local Government and Public Health out of the hospitals' share of sweepstake funds, and that the council's thanks are due especially to the Minister for the sympathy shown during the long period of negotiations, to Hospitals Trust Ltd. for financial assistance during this period, and "to all those who have worked so unremittingly during the past few years in order that a research council for the Irish Free State might become a reality." During the year the council held nine meetings, the first on February 16, 1937. Twenty-eight applications for grants were received, of which fifteen were sanctioned for one year, eleven were refused, and two were withdrawn by the applicants. Information concerning the training, whole-time, and part-time grants was published in these columns on November 6, 1937 (p. 934). In addition grants-in-aid have been awarded to Professor E. J. Conway, Dr. Ninian Falkiner, and Professors Fearon and Ditchburn. Dr. J. C. Shee has been given a grant to enable him to undergo six months' training in goitre research at a centre abroad, to be followed by six months' research into the goitre problem in Ireland. The grant holders, with the exception of Drs. Patrick FitzGerald and J. C. Shee and Professors Fearon and Ditchburn, began work before the end of December. Dr. de Valéra started on November 1; since the end of the year he has found himself unable to continue to hold the grant and has refunded to the council all payments made to him. Further applications for grants will be considered by the council three times each year, in February, June, and November, and it is hoped that before very long workers will be engaged on most of the vital medical problems which exist to-day. The offices of the council have been established at 85, Merrion Square, Dublin.

Curriculum at the National University

The National University of Ireland has adopted recommendations of the General Medical Council, and is to substitute at the beginning of the next academic year a pre-medical examination for the existing pre-registration examination. Under regulations now in force a student may sit for the pre-registration examination in elementary physics and chemistry at the age of 17. In future he may not sit for the new pre-medical examination, which will require a period of study of at least twelve months, until he is 18. He will thus have

reached the age of 23 before qualifying instead of 22 as now. The present first medical examination—in applied chemistry, applied physics, and general and applied biology—is to be replaced by a first medical examination in anatomy and physiology. The second medical examination will be in more advanced anatomy and physiology, while the third and final examinations will be as before.

ENGLAND AND WALES

Joint Tuberculosis Council

The winter meeting of the Joint Tuberculosis Council was held in London on February 19, and the members, with some visitors, were afterwards entertained to luncheon by the chairman, Dr. S. Vere Pearson, at the Hotel Russell. The health of the guests was proposed by the chairman, who remarked that the Council had rather tended to leave out the general practitioner, though one of its aims was to foster a good working relationship between tuberculosis officer and G.P., and he therefore welcomed particularly Sir Henry Brackenbury as a distinguished representative of that very large and important section of the profession. The Council was doing good work, but might do better still; that morning it discussed a valuable report on nursing and held a discussion on pneumothorax. Dr. Vere Pearson welcomed also Dr. L. Haden Guest, M.P., and Dr. Stella Churchill, Colonel Caddell, secretary-general of the National Association for the Prevention of Tuberculosis, and the editors of several medical journals. He voiced the feeling of all present in regretting the retirement from the honorary secretaryship of the Council of Dr. Ernest Ward, who, with his initiative and devotion, had been its moving spirit since it was founded seventeen years ago. Sir Henry Brackenbury, in reply, spoke of the importance of the Press and of Parliament in relation to medicine and the field of health. He said that the Joint Tuberculosis Council was now accepted by, and acceptable to, the public and the profession, but, like other specialist services, the tuberculosis service should be aware of the general practitioner's reactions to it. The good general practitioner wanted to be, and to remain, an all-round man, desiring full association with the special branches of medicine; it was not good for him to feel a sense of intrusion or a deprivation of experience and responsibility. The toast of "The Council" was proposed by Dr. Haden Guest, who recalled that the two main functions of the Joint Tuberculosis Council were the giving of scientific and administrative advice: beyond this he thought it might do more to influence public opinion, taking a leaf from the B.M.A.'s book. The medical view was apt to be underestimated by the public and by Parliament, and some pushing forward—even some vulgarization, however repellant to scientific people—must be indulged in nowadays to get points home. Dr. Ernest Ward, in reply, said that he laid down his secretarial work for the Council with regret and thankfulness. The chairman's health was proposed by Dr. Stella Churchill.

Medical Treatment of London School Children

The arrangements made by the London County Council for the medical and dental treatment of school children for the year beginning April 1 include the further extension of the treatment of squint by orthoptists working under the direction of ophthalmic surgeons, a method which has proved very successful during the past three years: an additional audiometric unit to relieve the congestion of children needing testing and treatment for ear defects; the opening of four new centres for the treatment of minor ailments; and an extension of the scheme of nutrition centres. An increase in the number of sessions devoted to dental treatment and additional provision for orthodontic treatment are proposed.

poisoning, mentioning in particular the delayed action that had caused so many fatalities in mine disasters. He showed how vitally important it was to use oxygen and carbon dioxide to expel the residual gas from the body, and urged the use of such apparatus not only in gassing cases but also in any injury where serious shock had occurred.

Dr. A. J. AMOR (Mond Nickel Company Ltd.) gave a practical demonstration of the value of radiology in the diagnosis and prognosis of silicosis. The problem under discussion, he said, was one of very great social significance. Disability for work had caused some of the most tragic conditions in the miner's home. The eventual disablement as a result of disease or injury produced repercussions on the whole economic structure of the community and the country as a whole. Dr. Amor devoted the main part of his remarks to a critical survey of the relationship between radiology and the problem at issue.

Dr. C. L. SUTHERLAND (Silicosis Board), Dr. A. MEIKLEJOHN (Silicosis Board), and Dr. E. R. A. MEREWETHER (H.M. Medical Inspector of Factories) also showed x-rays of the thorax, with reference mainly to the difficulties of differential diagnosis and of determining degrees of pathology from radiological examination of workers exposed to silicate dust. Captain HAY (Mines Department) was present by invitation, and demonstrated modern mechanical methods of dust prevention in mines, illustrating his remarks by a series of lantern slides.

TOWN-DWELLER'S LUNG

At a meeting of the Pathological Society of Manchester on February 9, with the vice-president, Dr. L. SAVATARD, in the chair, Dr. J. DAVSON read a paper on town-dweller's lung.

Dr. Davson said that anthracosis in town dwellers was due to the inhalation of siliceous dust along with carbon, and a study of ninety-four lungs which were free from gross pulmonary disease showed, by the technique of micro-incineration, that carbon and silica existed together throughout the tissue. Siliceous dust accumulation was most marked in the apical region and in elderly subjects. Histological examination of apical pleural scars showed that the majority contained no evidence of past tuberculosis, but appeared to be secondary to the accumulation of siliceous dusts at the apex. In some cases the intensity of siliceous dust accumulation in apical scars was quite comparable to that seen in cases of true silicosis, yet the subjects had not been especially exposed to the inhalation of silica dust. In a number of these cases actual silicotic nodule formation was observed at the sites of the most intense accumulation of silica. If so many of these apical scars were not tuberculous, the truth of the view that the majority of adults develop and recover from apical tuberculosis could be questioned; more stress should be laid on the factor of infection and less on the factor of individual immunity in the pathogenesis of pulmonary tuberculosis. This view should stimulate the efforts of public health workers towards the attainment of the complete and permanent segregation of the patient with "open" pulmonary tuberculosis. Siliceous dusts were known to encourage the growth of tubercle bacilli in the tissues: therefore the inhalation of such dusts from the atmosphere of towns must have a deleterious effect on the patient with pulmonary tuberculosis. *For that reason* he urged that no patient known to have pulmonary tuberculosis should ever be allowed to return to town life.

At a meeting of the London Association of the Medical Women's Federation on January 27 Dr. A. MEAVE KENNY read a paper on the use of sulphanilamide in obstetrics, discussing its application from the preventive and from the therapeutic points of view.

Local News

SCOTLAND

Scottish Lunacy Law

The Secretary of State for Scotland has appointed a Departmental Committee to inquire into the law of Scotland in relation to the treatment of mental disease. The reference to this committee includes the certification and supervision of persons of unsound mind, the release of such persons, arrangements for those suffering from mental illness but not certified, the procedure followed in the case of dangerous lunatics and in the case of mental defectives accused of criminal offences, the definition of mental deficiency, and the arrangements for dealing with mental defectives. The committee is to consist of Lord Russell of the Court of Justice in Scotland (chairman); the Hon. Mrs. J. E. Hamilton; Professor D. K. Henderson, Professor of Psychiatry in Edinburgh University; Sir James C. Irvine, Principal of St. Andrews University; Mr. William Leonard, M.P.; Major Basil Neven-Spence, M.P.; Mr. William D. Patrick, K.C.; Lord Provost John Phin, Dundee; Bailie Violet Robertson, Glasgow; Professor Thomas M. Taylor, Aberdeen University; and Dr. Aidan G. W. Thomson of the General Board of Control for Scotland. The secretary of the committee is Mr. J. A. W. Stone, secretary of the General Board of Control, and communications regarding the inquiry should be addressed to him at the offices of the Board, 25, Palmerston Place, Edinburgh, 12.

Carnegie Trust

At the annual meeting of the Carnegie Trust Lord Normand stated that the market value of the investments of the Trust, which had begun its operations thirty-six years ago with a capital of £2,000,000, now stood at £3,700,000, while out of the annual income a total of £4,000,000 had been distributed in grants. Mr. Andrew Carnegie had expected that beneficiaries would restore to the Trust a part of what they had received, and the sums repaid by beneficiaries had varied from year to year within narrow limits; the amount repaid in the thirty-six years had been about £40,000. A cheque for £200 in recognition of assistance amounting to £50 received nearly thirty years ago was recently received from a beneficiary, while a lady doctor had repaid not only sums granted to her but also those to her two brothers who had left the University in 1914 and had been killed in the war. Lord Macmillan said that thirty-seven beneficiaries had made repayments in the past year, of whom twenty were men and seventeen women: it was noteworthy that the women beneficiaries were rather less than one in three of the total. The report showed that for the seventh quinquennial distribution, covering the period 1935-40, an aggregate sum of £257,300 was allocated to universities and extramural institutions: St. Andrews £43,400, Glasgow £69,000, Aberdeen £46,000, and Edinburgh £68,900, with £30,000 to extramural institutions. The objects for which these sums were granted were: for libraries £38,750, for buildings and equipment £177,550, and for teaching and general purposes £41,000. The number of beneficiaries in 1936-7 had been 3,534, and the sums granted totalled £51,797.

Glasgow Royal Infirmary

At the annual meeting on February 14 of subscribers to Glasgow Royal Infirmary Sir James Macfarlane, who presided, said that during the year 18,155 patients had been treated in the institution. The daily average was 871 (22 more per day than in 1936), although the infirmary was designed to accommodate 650 patients. The report

building of the Great Western Railway led to the scheme being pushed on to completion. The opening celebrations on May 27, 1839, ended with a dinner costing 5s. a head (wine not included). The meal began at 3 o'clock and the company dispersed at 8.15, after listening to twenty-nine toasts, many with musical honours. A gallery was provided for 100 ladies, who were "regaled not with viands off the table but with the more refined luxuries of music and eloquence." The ladies appear to have become restless after the twenty-third toast, but were persuaded to remain until the twenty-fourth, when the reporter states that "they made their escape." The various chapters deal with different phases of the hospital's activities, the dental section alone appearing to have been omitted. X rays were soon used by the hospital, but not on a very large scale, as the running expenses of the department for the year 1900 were £7 12s. 11d. In 1903 Dr. Gordon Paterson exhibited to his colleagues a patch of dermatitis on his own skin, the result, he said, of carrying a small tube of radium in his waistcoat pocket. Dr. Logan Dahne gives an excellent account of the recent grant of Arms to the hospital, and illustrates it with a double-page plate in colours. The very useful appendices contain lists of the various officials attached to the hospital, with the dates of their appointment and termination of service. There is also a satisfactory index. The fifteen illustrations are well reproduced.

Remuneration in L.C.C. Mental Hospitals

Changes in the grading and remuneration of medical officers at certain institutions under the Mental Hospitals Committee of the London County Council are proposed. When the institutions of the old Metropolitan Asylums Board for mental patients were transferred in 1931 the medical needs of those institutions were not thought to require a large staff of medical assistants, and consequently there appeared to be a smaller degree of medical responsibility than at the large original institutions of the Council. Lower rates of pay were therefore fixed for the higher medical staff, though subsequently at two institutions special allowances were made. Since the transference there has been a considerable alteration in the conditions under which medical work is done, the standard of medical care has been raised, and the scope of treatment expanded in every direction. It is therefore felt that the grading and remuneration of the higher medical staff should now be the same at all the large transferred institutions as at the large county mental hospitals. This means that the medical superintendent, instead of £1,250 plus a house, will receive £1,450 plus a house; the remuneration of the deputy medical superintendent of a large institution will be £850-£50-£950, being an increase of £50, and that of the first assistant medical officer will be £750-£25-£850, instead of £625-£25-£750.

Medical Staffing of L.C.C. Mental Observation Units

The existing arrangements for the medical staffing of mental observation units at the hospitals of the London County Council provide for the seconding to those units for periods of not less than one year or more than two years of selected assistant medical officers in the mental services. Experience has shown that there is little likelihood of there ever being a sufficient number of officers of this rank in the mental services with the necessary qualifications and experience to maintain the steady sequence of volunteers needed for this duty. In fact, the four units at St. Pancras, St. Clements, St. Francis's, and St. Alfege's hospitals are, or very shortly will be, without suitable medical staff. It is therefore proposed to recruit the specialist staff required from the ranks of second assistant medical officers in the mental services, a grade higher than that from which volunteers for the duty are at present sought. This will necessitate an increase in the fixed medical staff of the mental services of the L.C.C. by four positions of second assistant medical officer, so as to permit of four officers of the grade always being seconded

to the observation units. It is also proposed that it should be a condition of promotion from the rank of assistant medical officer to that of second assistant medical officer that the officer promoted will be ready to undertake service, without option and in rotation, in an observation unit, and that a year should be taken as the normal period of seconding, though exceptional circumstances might make it necessary in some cases to extend the period to not more than two years. The scale of salary of the second assistant medical officers to be appointed will be £625-£25-£700; that of the assistant medical officers seconded under the original scheme was £470-£25-£570, with a special allowance of £50 a year to a holder of a diploma or degree in psychological medicine.

INDIA

All India Obstetric and Gynaecological Congress

The second All India Obstetric and Gynaecological Congress will be held at Bombay from April 13 to 16 next under the presidency of Dr. B. D. Mukherji of the Carmichael College, Calcutta. A medical exhibition is also arranged as part of the programme. The subjects chosen for official discussions are toxæmias of pregnancy and carcinoma of the cervix. The congress will be inaugurated by the Prime Minister of the Government of Bombay, and the medical exhibition will be declared open by the Minister of Health. An invitation is extended to all obstetricians and gynaecologists to attend the congress. Further information can be obtained from the organizing secretary, Raj Bhuvan, Sandhurst Road, Bombay, 4.

Women Patients in the Panjab

The report on the working of hospitals and dispensaries in the Panjab (1936) records a remarkable increase in the number of women patients. Unfortunately, however, continued financial stringency has precluded appreciable progress in the scheme for expansion of female medical relief. Although the number of women and children attending hospitals during the year under review exceeded that of the men, the available accommodation is stated to be totally inadequate. The deficiency is especially marked in the smaller centres. Only a few district headquarters have separate women's hospitals; in most cases the hospital includes a female section under the charge of a woman subassistant surgeon. At one district headquarters, Jhelum, there are no facilities, except at a mission hospital, for the treatment of women by doctors of their own sex. The report also emphasizes the need for special women's dispensaries in small towns and villages. A tribute is paid to the work of the mission hospitals, the pioneers of medical relief for women in the province. Many of these are finely equipped and are staffed by fully qualified lady doctors assisted by competent nursing staff. With regard to facilities for the medical education of women in the province the report states that the need for the establishment of the proposed Medical School for Women at Lahore becomes more pressing every year. The accommodation available at the Panjab Medical School for Women, Ludhiana, and at the Amritsar Medical School, where the system of co-education is in force, is far from sufficient, and many applicants for admission have to be refused. Dispensing appears to be less popular as a career for women, and it is a matter of difficulty to induce students to train for this important work.

Assam in 1936

From the annual public health report of the Province of Assam it appears that 1936 was a comparatively healthy year, without major epidemics; the death rate fell, as also did the birth rate. The registration of vital statistics is still regarded as being far from satisfactory, and officials of the public health department have been urged by the

Hunterian Society Dinner

The annual dinner of the Hunterian Society was held at the May Fair Hotel on February 17, the 210th anniversary of the birth of John Hunter. After the loyal toasts, "The Memory of John Hunter" was honoured. Lord Snell, the guest of honour, then proposed the health of the Society. He said that much medical knowledge—for example, about food—was not applied either by local authorities or by individuals in their own homes: in fact, much propaganda was devoted instead to creating an entirely wrong sense of food values. In responding, the president, Dr. D. C. Norris, reviewed the activities of the Society during the past twelve months. The publication of the *Transactions* had been resumed last year. He then formally presented to Dr. John Wilson Reid of Anglesey the gold medal of the Society for an essay on the prognosis and treatment of heart disease in general practice. The toast of "The Guests and Kindred Societies" was proposed by Mr. Alex E. Roche, and on behalf of the guests Judge Earengay, K.C., Sir John Stavridi, and Mr. Hugh Lett (Master of the Apothecaries' Society) responded.

Births and Deaths in London in 1937

The births registered in London during the fifty-two registration weeks of 1937 numbered 63,816, compared with 65,375 in the fifty-three registration weeks of 1936. The crude birth rate per 1,000 of the population in 1937 was 15.6 as against 15.8 for 1936. The corrected rate (which excludes the births of non-Londoners) will be about 13.4. The deaths registered in 1937 numbered 50,081, compared with 51,454 in 1936, when, however, there were fifty-three registration weeks. The crude death rate was 12.2. The infant mortality showed a marked drop in 1937, being 51 per 1,000 registered births, as against 57 in 1936. Deaths from puerperal sepsis and other accidents of childbirth in 1937 numbered 124, or 1.9, per 1,000 registered live births, against 115, or 1.8, in 1936. There were 520 deaths from street accidents in London in 1937, a slightly lower figure than for the two previous years.

Reunion of Radiographers

The annual dinner of the Society of Radiographers, held in London on February 19, brought together over 200 members, the largest gathering in the seventeen years' history of the society. Dr. G. W. C. Kaye, the president, welcomed the guests, who included Mr. C. Thurstan Holland, the "grand old man of radiology," Dr. Russell J. Reynolds, president of the British Institute of Radiology, with which the society has a working alliance, Dr. R. E. Roberts, president of the Section of Radiology of the Royal Society of Medicine, and representatives of affiliated societies of radiographers in Manchester, Liverpool, and the Midlands. Mr. Thurstan Holland, in responding for the guests, took his audience back to the earliest days of x-ray work in 1896, and declared that he had as good a claim to call himself a radiographer as any of those present, because in those early years, until 1904, he had to do everything in his department, including the repair of apparatus, the development of plates, and the making of prints and lantern slides. He had also occasionally to offer an opinion to senior physicians and surgeons, among whom in those days the "x-ray man" was not very popular. In 1904 at the Royal Infirmary, Liverpool, he was given the services of a lay assistant, and to that first assistant and all his successors he paid a tribute. Never once had he been let down by an assistant. Mr. Cuthbert Andrews, in proposing the health of the Society of Radiographers, reminded his listeners of what they had gained in status, recognition, and salary scale under its auspices, and Dr. Kaye, in responding, said that the membership of the society was over 1,100, and was increasing at the rate of about 100 a year. It was recognized by the Board of Medical Auxiliaries, and it had four

branches—in Scotland, in South-West England, and in Australia and South Africa. The aim of the members was to serve the medical profession to the utmost of their ability. During the evening the Sir Archibald Reid memorial medal was presented to Miss A. M. V. Ash of the Western Infirmary, Glasgow, for a prize essay, and the Stanley Melville memorial medal to Mr. H. T. Ferrier for the best lecture of the session. A cheque was also presented, with many expressions of appreciation, to Mr. F. Melville, who has been honorary secretary of the society since 1927.

Ambulances in Air Raids

The report of the Home Service Ambulance Committee of the Joint Council of the Order of St. John of Jerusalem and the British Red Cross Society for the quarter ended September 30, 1937, points out the importance of ambulance transport in air raid precautionary schemes. In the event of war a great deficiency in the number of ambulances available is foreseen, and the creation of improvised transport from trade vans and other vehicles is envisaged. For the manning of these ambulances a large increase in the numbers of trained personnel would be necessary. The staffing of first-aid posts for treatment and decontamination, and of first-aid parties to search for and rescue the wounded in streets and houses, together with the provision of skilled helpers to assist overburdened hospital staffs, would also demand a large number of trained men. The report therefore maintains that recruiting must be pursued with the greatest energy, and that the time for this is now. Alluding to recent trials carried out in various parts of the country, the report draws a vivid picture of the difficulties likely to be encountered, especially during air raids at night.

"With all lights extinguished or obscured, with vision further hampered to a considerable extent by respirators, driving perhaps through clouds of gas, and having to keep a constant watch to avoid craters in the road caused by high explosives, and floods due to burst water-mains, they would have to grope their way to places where casualties have occurred; to assist the first-aid parties in carrying out such first-aid work as is immediately essential; to make every effort to avoid the contamination of themselves and their patients by mustard gas; and to get their patients as quickly and safely as may be to their appropriate destination, whether hospital or first-aid post."

The report states that many consultations have taken place between representatives of the Air Raid Precautions Department of the Home Office and those of the Order and the Society concerning the preparation of schemes for adequate ambulance service. It is pointed out that if ever the occasion for action arises it will come suddenly, and it is therefore of prime importance that plans to secure, adapt, equip, and man the necessary vehicles should be completed beforehand.

Royal Berkshire Hospital Centenary

The story of the Royal Berkshire Hospital¹ is told with the laudable intention of helping the hospital's centenary appeal fund. Every good wish, therefore, attends its publication. The approbation of Queen Mary, to whom the volume is dedicated, has already been obtained, and her signature is reproduced in each copy. The book is a cento rather than a reasoned history, for the eleven chapters are contributed by ten writers. But it is a readable patchwork, contains much that is interesting, and details the growth of the hospital from small beginnings to its present position amongst the greater provincial hospitals. It secured the patronage of William IV at a very early period of its existence. His death caused the postponement and final abandonment of the opening ceremonies until the number of accidents attending the

An English Pneumonia Service

SIR.—I cannot tell Dr. W. G. Booth (*Journal*, February 19, p. 417) whether a county council is allowed to supply anti-pneumococcal serum free, but any local sanitary authority can do so. For years past the two local authorities for which I am part-time medical officer of health have done this. They pay for the typing of the sputum and provide the serum free of charge. It is stored at the sanitary inspector's office, at his residence, and at my residence; in this way, as Dr. Booth so wisely stresses, it is available day and night. The storage of the serum is not costly, since any serum which is not used can be returned to the makers shortly before the date of expiry stamped on each packet is reached, and is replaced by a fresh supply free of charge. I suggest that Dr. Booth might ask the local medical officers of health to request their council to pass resolutions authorizing this service.—I am, etc.,

ARTHUR T. BLEASE.

Medical Officer of Health, Bucklow Rural
and Knutsford Urban Districts.

Altrincham, Cheshire, Feb. 20.

Oblique Osteotomy for Fracture of Neck of Femur

SIR.—The one problem which remains in the treatment of this injury is avascular necrosis of the head of the femur. In reporting his operation of oblique osteotomy (*Journal*, February 12, p. 330) Mr. T. P. McMurray attributes this necrosis to the nailing operation, and suggests that it is due to the mass of metal in the bone. He therefore advocates osteotomy and plaster immobilization as the primary treatment in recent fractures.

But avascular necrosis and disintegration of the head is not a complication of the nailing operation; it is a complication of a certain type of hip injury which occurs whether there is a nail in the bone or not. The nutrient vessels of the shaft extend no higher than the femoral neck; the head of the bone is supplied entirely by vessels which enter through the capsule of the joint, and in a proportion of cases through the ligamentum teres. If a fracture lies below the capsular attachments the blood supply of the head is unimpaired. Avascular necrosis does not occur, therefore, in basal or low cervical fractures even if they are nailed. If the fracture lies above every capsular attachment to the bone, this source of blood supply is cut off and the vitality of the head depends on the vessels of the ligamentum teres. Where these vessels are also inadequate necrosis will now occur, whether the fracture is treated without operation, by nailing, or by osteotomy. It occurs even more commonly after traumatic dislocation of the hip, because both capsule and ligamentum teres are damaged and both sources of blood may be cut off. It also occurs after arthroplasty of the hip if the capsule has been too freely reflected, and occasionally in epiphyseal coxa vara and other hip injuries. The evidence suggests, therefore, that the complication has nothing whatever to do with the nail. Provided that the earlier type of open reduction involving capsular reflection is abandoned in favour of extra-articular insertion, the operation for introduction of the nail must also be exonerated.

To perform the oblique osteotomy successfully is no easier than to perform the nailing operation successfully. Moreover, the end-result is not quite so good. There is slight limitation of certain hip movements, shortening, and a tendency to stiffening of the knee. If we can be

sure that we are dealing with a case which will not develop avascular necrosis the nailing technique is undoubtedly better. On the other hand, if necrosis and degenerative arthritis supervene the result of oblique osteotomy is as good as the result of an arthrodesis, and has the advantage of attainment by one operation instead of two. The only justification for the routine use of osteotomy in recent fractures would be a very high incidence of degenerative arthritis.

We know the incidence of the type of fracture which impairs the blood supply of the head of the femur, for there is always radiographic evidence of this five to eight weeks after injury. But we are not sure how often the head can survive this ischaemia. Not until several more years have elapsed shall we be certain of the incidence of actual disintegration of the head. But there can be no doubt that it will be less than the 25 per cent. Mr. McMurray suggests. The report that Henderson has found disintegration of the head in 25 per cent. of his successful results is, I think, a misquotation. In the article with which I am familiar (*Surg. Gynec. Obstet.*, 1937, 65, 711) Henderson merely states that in approximately 20 to 25 per cent. of adults the blood vessels in the ligamentum teres are lacking. This would mean that avascularity of the head occurs in 20 to 25 per cent. of fractures which lie above all capsular attachments—that is, in 5 to 10 per cent. of all fractures of the femoral neck. This incidence would conform much more to one's own provisional estimates, and it is not high enough to justify abandoning the nailing operation with its possibility of perfect results in the other 90 to 95 per cent. of cases.

At the moment one's own routine is to nail all recent fractures, arthrodesis united fractures with disintegration of the joint, and perform the McMurray osteotomy for ununited fractures and for fractures several weeks old which already show evidence of an avascular head. Possibly we should go further, and in those few cases already nailed which after a few weeks show an avascular head we should not wait for the disintegration, but at once remove the nail and perform the osteotomy. But I would urge that the osteotomy should be reserved for these strictly selected cases. For them it is an invaluable procedure—simple and effective. For the uncomplicated case it is far short of the ideal.—I am, etc.,

Liverpool, Feb. 13.

R. WATSON-JONES.

SIR.—It is with considerable diffidence that I write to criticize a paper by so eminent an orthopaedic surgeon as Mr. T. P. McMurray (*Journal*, February 12, p. 330). My experience of the nailing operation for median fractures of the femoral neck has been so satisfactory that I cannot allow Mr. McMurray's comments on this procedure to go unchallenged. Summarizing his points he writes:

"The disadvantages of the insertion of a metal pin are: (1) the risks of failure to insert the pin in the ideal position, and the very definite risk of non-union; (2) the occurrence of fragmentation in the head of the femur following an apparently successful operation; (3) the very definite risk of infection in the hands of non-experts in the method."

To take these objections in order. In the radiologically controlled operation (which is an operation that must at least be considered in any criticism of nailing procedures) a guide wire is first placed in the "ideal" position in an accurately reduced fracture and its position is checked by x-ray examination before the nail is driven home. Following this technique there should be no badly placed nails.

Governor to acquaint themselves more closely with the conditions of the villages in the interior, and to track out and subdue those diseases to combat which the department was created. Malarial fevers constitute the chief scourge of this Province, but there was a fall in the incidence of them in the year under review as compared with 1935. Quinine-reinforced cinchona febrifuge was used as a general preventive and curative agent, and its supply to the population has been promoted by lowering its cost. The Assam Medical Research Society has been concentrating its activities on malaria control with promising results, especially as regards the campaign against *Anopheles minimus*. There was a slight rise in the incidence of small-pox, but a fall in that of cholera. Vaccination against the former disease is not compulsory in rural areas in Assam, but the people are encouraged to be vaccinated; in some areas there is much opposition to overcome. The kala-azar incidence and mortality rate fell. The intravenous injection of urea-stibamine is the method of diagnosis and treatment, and a great deal of survey work is undertaken with a view to prevent a recrudescence of this disease. Rice is the staple diet. It is reported that adulteration of food is increasing and that the Assam Pure Food Act is not working very satisfactorily, local boards showing little interest in this matter, though the record of municipalities in this respect is somewhat better. Consideration has been given to the problem of reorganizing the public health department so as to create a more intimate spirit of co-operation between the villagers and officials of the department.

Madras Hospitals and Dispensaries

Major-General Sir Frank Connor, I.M.S., surgeon-general with the Government of Madras, reports a net increase of one in the number of civil hospitals and dispensaries in that Presidency in 1936 compared with the previous year. There were 1,235,295 cases of diseases of the respiratory system other than pneumonia and tuberculosis, and 1,192,351 of diseases of the digestive system: 614,079 operations were performed, with a death rate of 0.25 per cent., compared with 0.27 in the previous year. There was a decrease in the number of maternity cases conducted in these institutions, due to the opening of more maternity and child welfare centres, the appointment of separate midwives by municipalities and district boards for domiciliary work, and the consequent prohibition of hospital and dispensary midwives from conducting labour cases outside their institutions. A considerable fall occurred in the tuberculosis death rate. As a further step in anti-tuberculosis work in Madras City a tuberculosis clinic on up-to-date lines has been started for the examination of contacts as an adjunct to the Tuberculosis Institute, and the Government has taken over Dr. Muthu's sanatorium at Tambaram with the view of providing more accommodation for such cases. Sir Frank Connor states that there is need of some thousands more beds for tuberculosis cases in hospitals, sanatoria, and clinics. Radiological work grows apace in the Presidency; two new departments were opened in 1936, and more are being established, while several of the older ones are being brought up to date by the addition of new equipment. At the end of 1936 there were 445 leprosy clinics actively functioning; with a grant-in-aid from the Silver Jubilee Fund special clinics for the study of leprosy and its epidemiology are being established in five places and increased bed accommodation is being arranged in eight leper hospitals. Special investigation units are being established for intensive study of the disease, particularly in children. The Government General Hospital in Madras has been remodelled, and new hospitals have been completed at Madura and Cocanada. There was an increase in the number of medical students in the Vizagapatam and Madras medical colleges; a revised curriculum was approved in 1936 suitable to the extended course of five years.

Correspondence

Co-operation

SIR,—The report by Mr. Harold Murphy on the outbreak of typhoid fever at Croydon will be closely studied by medical officers of health in order that they may find out if there are any ways in which their customary procedure in dealing with outbreaks of infectious disease may be varied or improved on, and it may be assumed that both the Society of Medical Officers of Health and the British Medical Association, between which there exist the most cordial relations, will during the coming months give the matter their close consideration.

There is one important section of the report which unfortunately is not quite clear. I refer to the functions of the suggested committee of local practitioners to consult with the medical officer of health. It is true that Mr. Murphy does not actually suggest that "the more ready communication between the medical officer of health and the general body of practitioners" should take the form of a committee representative of local general practitioners, but it is evidently the view of Lord Dawson and other prominent medical men that it should take this form. Now the universal practice of medical officers of health when confronted with a possible epidemic of a dangerous disease is to establish immediate contact, either by telephone or by letter, or by both, with all the local medical men practising in the area at risk, informing them of the danger, in order that they may get in touch with him at once if they have any patients with symptoms arousing suspicions of the disease in question. It is also the universal practice for the local medical men to co-operate fully with the medical officer of health and to refer to him without delay either definite or suspected cases of the disease. They expect and receive without question and without delay the fullest help which the public health department can offer them, usually in the form of personal consultation with the medical officer of health at the bedside of the patient. The medical officer of health can do no more; he dare do no less.

What, then, would be the function of the committee, which would necessarily consist of only a small proportion of the practitioners of the area? What information could be given to or by the committee which should not be given to all the practitioners in the area? The medical officer of health cannot delegate any part of his responsibility in dealing with an epidemic to any committee; he must personally be responsible for all information reaching all the practitioners direct. And when the practitioners have information of value to the medical officer of health, why should they not, in a situation where no time may safely be lost, transmit this information directly to the medical officer as in the past? In the face of recent legislation, especially the Local Government Act of 1929, which transferred all the old Poor Law beds to the local authority, no one will question the advantage to both the medical officer of health and the local profession of a standing committee through which both sections may consult and co-operate, but in the presence of an actual epidemic of infectious disease it is not clear what useful purpose meetings of this committee would serve.—

I am, etc.,

HUGH PAUL, M.D., D.P.H.,
Medical Officer of Health.

Smethwick, Feb. 16.

that he had been misinformed. Nadi district was first put under my control in 1933, and a similar series of inoculations was started there. It will be of interest to note the results at Nadi also if the vaccination is continued, say, for five more years.

The immediate value of antityphoid inoculation as carried out at Lautoka may be admitted. Much sickness and many deaths have been prevented, and there is value in the success of any beneficent measure that calls for explanation and co-operation between the different classes and races. Such are unfortunately the total gains. The causes of the prevalence of enteric fever remain, and they are to a large extent also the causes of bacillary dysentery. These causes are well known. They are published in the newspapers. They evoke the taboos and dogmas of primitive man. They are platitudes of the schoolroom and the council chamber. Nevertheless a little repetition may be of benefit. The chief cause is polluted water. A pipe supply of pure water to all closely settled areas would spell the end of epidemics of typhoid and bacillary dysentery in Fiji.

Existing water supplies for drinking and cooking in this and most other Indian districts are from wells and streams. Both sources are subject to the gravest pollution. The wells are badly made and badly situated. The streams mostly run through small holdings, the custom being for defaecation to be performed near water—that is, near a stream. The first rain then washes the excrement into the stream, and thus pollutes the supply for all below it. Even in the absence of rain some of the ablation water may reach the stream. This bad habit is not confined to Indians: I have seen similar practices in Fijian districts. In this district the pollution is realized by those who live on the lower reaches of the streams, so that they go out to collect their drinking water at four in the morning, when the stream has had the night for recovery, and pollution may be, they think, at its minimum. The above is unpleasant reading, but it is as well to remember that no sensible person would drink river water or stream water in England—pollution is just as bad, though of a different nature.

The true answer to the problem of dysentery and typhoid in Fiji is a piped supply of pure water. The next best thing is a rigid inspection of all wells. A less beneficent method is that which has been described above—namely, immunization.—I am, etc.,

Lautoka, Fiji, Jan. 2.

PHILIP HARPER, M.D.

Br. abortus Infection Treated by Sulphanilamide

SIR.—Although the occurrence of infection by *Brucella abortus* in this country is not common, according to Creed 25 to 30 per cent. of retail samples of mixed unpasteurized milk contain this organism, and it is estimated that 20 per cent. of the cattle in Great Britain are infected. It is therefore surprising that more cases do not occur, since pasteurization is, unfortunately, by no means the usual practice, and infection, except among those engaged in milking the cows, is always milk-borne. The comparative rarity of the disease and the lack of distinctive physical signs make the diagnosis difficult, and treatment up to the present has been mainly symptomatic and consequently somewhat unsatisfactory.

The following case presents the usual symptoms and signs of the disease and suggests an effective treatment.

A married woman, aged 66, was seen by me on December 20, 1937. She said she thought she had a temperature for a fortnight, but had not felt sufficiently ill to consult a doctor. It was her first day in bed and she complained of headache,

lassitude, anorexia, and insomnia. The temperature was 102° F. and the pulse rate was 92, but careful examination revealed no other abnormal signs. A specimen of urine showed nothing abnormal.

I saw her again on December 23, and as the temperature had risen each day to between 102° and 103° F. I asked Dr. Facey to examine her blood. He reported that the Widal was negative for T.A.B. but agglutination occurred with *Br. abortus* in dilutions up to 1 in 2,500. The blood count revealed: red cells 4,050,000, haemoglobin 68 per cent., colour index 0.84, white cells 4,000; a differential count showed nothing abnormal. To confirm the diagnosis an intradermal dose of brucellin was given, and gave a strongly positive reaction in thirty-six hours.

A supply of brucellin for inoculation could not be obtained, so a blood transfusion of 350 c.cm. was given on January 6 in order to increase the leucocytic and red cell count, and also in the hope that it might supply missing complement to the patient's blood. She felt better but for a few hours only. On January 13 a dose of 0.75 c.cm. of brucellin was given intramuscularly, but no reaction occurred and no improvement followed.

Having read a letter by Dr. J. H. Lloyd in the *Journal* of January 15, I gave my patient a first dose of *p*-aminobenzenesulphonamide on January 17. At the same time I gave her another injection of 1.25 c.cm. of brucellin. There was again no reaction from the brucellin, but next day the temperature was normal. Two 7½-grain tablets of sulphonamide were given the first day, eight the second, and eight the third, the temperature remaining normal all this time. The dosage was then cut down to one tablet daily, and on January 25 a rise in temperature to 99° F. occurred. The tablets were increased to four daily and the temperature has been normal since. The patient is now up and about and appears to be in normal health.

A reactionary rise of 2° F. is required before brucellin is expected to have any beneficial effect, and, as no reaction occurred after either injection, it would appear that the fall in temperature was due to the sulphonamide preparation, especially as it controlled a slight rise of temperature later. The duration of *Br. abortus* infection, according to Dalrymple-Champaey, averages twelve and a half weeks, so that any remedy which appears to influence so readily the course of the disease deserves to be brought to notice. It is with this object that I record this case.—I am, etc.,

NEWTON MATTHEWS, M.B., Ch.B.

Bournemouth, Feb. 15.

Erysipelas and Cellulitis

SIR.—In these days of sulphonamide medication for haemolytic streptococcal infections some of the older and approved methods of treatment are apt to be lost sight of. In Mr. John Hosford's interesting article on erysipelas and cellulitis in the *Journal* of February 12 (p. 346) I note that no mention is made of the advantages of open-air treatment in these cases. During the war, when erysipelas infections of war wounds were not uncommon, it was generally accepted that a marked improvement occurred on removing these cases from the wards and treating them under canvas.

At the Royal Victoria Hospital, Netley, during the war a relatively high mortality was noted among the cases treated in the wards of the old hospital, whereas the cases transferred to bell tents showed a rapid fall of temperature and a general improvement in their condition. Among those treated in this way there were no deaths at all, although the numbers under observation were considerable. It was noted that if the case were transferred back to the hospital wards in under seven days a relapse was liable to occur, but if they were kept over ten days

The problem behind fragmentation of the head is surely one of destruction of its blood supply, which is mainly carried to it by the capsule and its reflexions. Any open exposure of the fracture site perhaps adds to the damage to the "vascular" capsule, which has already been injured by the trauma causing the fracture, but in these days we pay as much attention to the capsule as we can, and reduce our fractures by gentle methods. We nail them by an extra-articular technique when, and only when, we have an exact reduction of the fracture. This reduction does not indicate that the bony surfaces alone are in apposition, but it also means that the rent in the torn capsule is reduced and its edges are in close enough apposition for healing to occur and for the vascular damage to be repaired. Mr. McMurray's figures (quoting Henderson) of a 25 per cent. incidence of necrosis of the head of the femur following the nailing operation are much too pessimistic. In my series of over fifty radiologically controlled operations I am aware of only one case of a definite change in the head. I think it would be safe to reduce this 25 per cent. incidence to 5 per cent., and I am prepared to grant larger figures than this when fractures are nailed which are not accurately reduced; but surely this is an error of technique rather than a criticism of the method. I disagree with Mr. McMurray's contention that the metal nail may be a cause of necrosis of the head fragment at "any time within the next two or three years" following the operation. The nail is placed through the fracture to immobilize it until union has occurred. When that result is obtained the nail should be removed. I have removed over twenty nails when I have considered their removal a safe step. I think I can look upon these cases as true end-results. They all are satisfactory, and prove to me the real value of the nailing operation. As regards infection, I have not even one such case in my extra-articular operations. Compared with my experience of the open operation, the absence of infection and shock is one of the greatest advantages of the extra-articular procedure. Since the average age of my patients is well over 60 this advantage is real.

Considering only recent medial neck fractures, there is one type in which the bone of the femoral neck is extremely soft—so soft indeed that the nail is not an efficient immobilizing agent, and "impaction" of the fracture is impossible. A plaster support has to be used in addition to the nail to secure immobilization. For this type of fracture Mr. McMurray's osteotomy may be the wiser procedure; but such patients will be considerably older than those reported in his series.—I am, etc.,

St. James' Hospital, S.W.12, Feb. 14. WILLIAM GISSANE.

Adult Serum in Measles

SIR,—I should like to enter a timely plea to those clinicians and pathologists who, like myself, are concerning themselves with the preparation and use of adult measles serum to utilize the present epidemic as a means of comparing adult serum in its preventive and attenuative aspects with commercial placental extracts. I am informed by an L.C.C. authority that the potency of such placental extracts was found to be *rather less than half* that of adult serum. The matter is one which needs clarification, and it is hoped that the present epidemic will provide a clear and unequivocal answer. The results obtained from adult serum in local use have so far been very satisfactory, but it would be premature to form a comparative opinion at

the present time. The British Medical Association would be performing a very valuable service by collecting and correlating statistics on these lines.—I am, etc.,

A. GEOFFREY SHERA, M.A., M.D.Camb.,
Eastbourne, Feb. 17. Honorary Pathologist, Princess Alice
Hospital, Eastbourne.

Antityphoid Inoculation

SIR,—On taking over the appointment of district medical officer, Lautoka, in February, 1930, it appeared to me that a complete or almost complete immunization of my whole district against enteric fever and the maintenance of that immunity over a period of years would be one of the most beneficial of practical public health measures. Hitherto no such comprehensive measure has been carried out in this country.

A yearly crop of cases of enteric fever used to occur in Lautoka district, one year one area providing the bulk of the cases, another year another area. In 1923 there were thirty-four cases with four deaths, and in 1927 sixty-one cases with ten deaths. In other years before 1930 the true Lautoka cases were not always distinct from cases which were admitted to Lautoka Hospital from other districts, so that accurate figures are absent, but undoubtedly the amount of sickness and death was large. The Lautoka medical district contains 10,000 persons, of whom just over 7,000 are between the ages of 1 year and 40. The races are roughly: Europeans, 400; Fijians, 900; Indians, 8,000; others, 600. The population of Nadi district to the south of Lautoka is 12,000 and of the Ba district to the north is 15,000. The other boundaries to Lautoka medical district are the mountains to the east and the sea to the west.

It was decided to inoculate that section of the population which was aged from 1 year to 40 years, the full dose to be 1 c.cm., but the dose to be decreased according to age and weight. The inoculations performed in each year were as follows:

1930	4,000	1935	790
1931	2,451	1936	1,237
1932	4,179	1937	4,744
1933	4,093		
1934	2,740	Total	24,234

The following are the numbers of cases of enteric fever and mortality by years up to 1937:

Year	Cases	Deaths
1931	19	4
1932	7	0
1933	8	1
1934	0	0
1935	2	1
1936	1	0
1937	3	1

These figures suggest a very large measure of success for the antityphoid inoculation. During these years the Lautoka Hospital has received many cases of enteric from Ba, Tavua, and Nadi, some even from Ra and Sigatoka. There were in fact several epidemics at Tavua, Ba, and Nadi. Though bounded on each side by districts in which typhoid epidemics were occurring, the disease steadily decreased in numbers at Lautoka, as shown above.

It is true that in 1935 the Deputy Governor stated in Legislative Council that a small epidemic of typhoid fever had occurred at Lautoka. I wrote to point out His Excellency's error, since there was no epidemic at Lautoka, though there was an epidemic at Ba and at Nadi—that is, on either side of Lautoka. His Excellency replied to me in a personal letter admitting his mistake and regretting

advises on contraceptive technique and to the principles and teaching of the National Birth Control Association.

For many newly married women it is imperative that pregnancy should be postponed, as, for instance, when the woman is working and her husband is unemployed. The contraceptive measures advised at the clinics are considered essentially to be prophylactic, both for avoiding "anxiety states" and, of utmost importance, for combating the high incidence of criminal abortion with its subsequent morbidity and sterility. Some of the clinics have maintained records of the "condition of cervix" over a period of many years. Nulliparous and multiparous patients return at six-monthly intervals for supervision and for general advice upon spacing their pregnancies. The quotations offered by Mr. G. H. Alabaster concerning the relation between endocervicitis, erosion, and sterility (*Journal*, February 19, p. 419) seem to add confusion to the original issue.

If there were any evidence that the methods advocated by the N.B.C.A. did, in fact, induce these conditions (or influence fertility in any other way) these suggestions would become a matter of gravest concern. As this has not been evident among large numbers of control cases, the contention does not appear to be relevant.—I am, etc.,

JOAN MALLESON.

London, N.W.1, Feb. 21.

Time for Midwifery

SIR,—May I reply to a letter by Dr. John Elam (*Journal*, February 5, p. 310) asking why nothing has been done regarding maternal mortality? I do not know what has been done in New Barnet, but I can assure him that my county has not been idle, and that we have four services in good working order: (1) the general practitioners' ante-natal service; (2) clinics all over the county where expectant women may receive dental treatment and free milk; (3) beds, ready to receive the cases, are available in the special and general hospitals; and (4) consulting obstetricians are prepared to attend at once on the request of the general practitioner, and are paid for by the county authorities. Dr. Elam also suggests that women doctors have a special aptitude for midwifery and that all cases should be handed over to them. Having myself attended more than 2,000 cases, I cannot believe that this suggestion was made seriously. If Dr. Elam would get his prospective mothers to live healthy outdoor lives, and see that they were not worried by too much pelvimetry, vitamins, or headlines in the yellow press, the maternal mortality problem would solve itself.—I am, etc.,

Torquay, Feb. 14.

HORACE ROSE.

SIR,—It is unfortunate that your correspondent Dr. Robert Anderson (*Journal*, February 19, p. 419), before criticizing my suggestion that want of time is the basic cause of bad midwifery, did not give a little time to a study of the Maternal Mortality Report of 1937. This report I cannot quote at length in your columns, but Dr. Anderson would find it worth close study. We read, for example, on page 189, that certain essential examinations in the ante-natal period were found to have been infrequent and irregular. The Departmental Committee tells us that "there is too little ante-natal supervision, and what there is too perfunctory to deserve the name." The Scottish Report says: "It is obvious that ante-natal care falls far short of what might reasonably be expected." It is not suggested that practitioners did not know how to do ante-natal work but that they did not give sufficient time to ante-natal work. On the other hand, comment is made on the good work done at

municipal clinics, where the maternity officer did have time.

Turning to the conduct of the confinement (p. 191) we read that "there was evidence of hurried midwifery and of premature interference, etc." According to the Scottish Report, "one of the most disquieting features of present-day practice is hurried and unnecessarily meddlesome midwifery." Comment, too, is made in both these reports on "failed forceps" cases. Hurried midwifery, premature interference, what is this due to but want of time? So long as doctors and midwives are expected to work twenty-four hours a day for seven days a week, just so long will the disasters and mistakes of midwifery occur. Fatigue plays an important part in the cause of accidents. There is ample evidence in the 1937 report that, be the reason what it may, practitioners do fail to give sufficient time to midwifery. The suggestion that practitioners will not take time over their cases is not mine, but is made by the writers of the report. Many people have found the report objectionable, especially the women sufferers. It recommends that "these general practitioners who undertake obstetric work should be interested, experienced . . . and have sufficient time for unhurried work" (p. 193). By all means train the student and the young practitioner in obstetrics, but without time to give to the work knowledge is in vain.

Your correspondent appears to deplore the fact that so much work has been handed over to the midwives, yet it is generally recognized that the conduct of the normal confinement is best left in the hands of the competent midwife. Those of us who are attached to maternity hospitals constantly see cases coming in of which we are ashamed. If we are to retain the confidence of the public these cases must cease. There is urgent need for drastic reform of our maternity services, and it is better that we should do this ourselves rather than wait for an exasperated public to do it for us. We must hope that there are practitioners who have more constructive proposals to make towards this end than your correspondent.—I am, etc.,

New Barnet, Feb. 19.

JOHN ELAM.

Asthma and Sensitivity to Aspirin

SIR,—The leading article on drug allergy in the *Journal* of February 5 (p. 289) is most interesting and valuable, especially the reference to sensitivity to aspirin. It is taking the profession a long time to realize the importance of the fact that aspirin is not the harmless drug it is commonly supposed to be in certain cases of asthma. As long ago as August, 1919, you published a letter of mine which said:

"It is a fact not sufficiently well known that a patient with a low blood pressure and nasal polypi cannot safely take aspirin. Consequently there is great danger in giving aspirin indiscriminately in cases of asthma. It is always risky to use if the patient has, or has had, nasal polypi, but if the patient has a high blood pressure unpleasant results are not so likely to happen."

In spite of this and other repeated warnings of mine,¹ and of others, the risk of giving aspirin in these cases is not properly appreciated, as is shown in the following instance. I warned a patient, who had asthma with nasal polypi and a low blood pressure, that she must never take any aspirin. She told me that she was well aware of the fact because she had been made very ill by being given aspirin, in spite of her protestation that she could not take it, at five different hospitals to which she had applied

¹ *British Medical Journal*, August 29, 1925, and *Asthma and its Treatment*, 1922.

the return to the surgical ward was not followed by any untoward complication. The conditions of treatment in the bell tents were by no means ideal; the tents were often leaky, and in winter were cold and wretched. It seems to be hardly appreciated at the present time how important the open-air treatment of septic cases has proved in the past.—I am, etc.,

London, W.1, Feb. 19.

DENNIS EMBLETON.

Treatment of Boils and Carbuncles

SIR,—I read with great interest in the *Journal* of February 19 (p. 400) Mr. John Hosford's article on boils and carbuncles, and especially the section of his article dealing with carbuncle in diabetes. For some years past in such cases I have with great success, in addition to getting the urine sugar-free, used a lotion which is composed of syrup. simplex, usually with a little brilliant green:

R Brilliant green gr. ss
Syrup. simplex ad 3 iv

It is a good stimulant to lymphatic activity, and soon produces a much more healthy-looking granulation area, and when the slough has separated healing is much more rapid in such cases than I can obtain by any other method. I usually soak a piece of lint in the lotion of the size of the sore part and cover with cotton-wool and a moderately firm bandage, and redress once or twice a day.

I believe the action is mainly that of the sugar, which is hypertonic, and also probably makes up for a deficiency of sugar in the parts, which retards active cell proliferation. It is equally valuable in the sloughing type of ulcer which one finds in many diabetic cases, but I have not found it do any good when so applied to parts where there is a threatened slough and the skin is not broken. I would be interested to know if others get similar results.—I am, etc.,

London, S.E.6, Feb. 18.

LAWRENCE WEIR BAIN.

Cauterization of the Cervix

SIR,—Electrotherapeutists who deal with gynaecology welcome the article of Professor James Young (*Journal*, January 15, p. 105), and also the letter of Mr. E. Lawton Moss (February 12, p. 361), which drew attention to certain after-results of strong cauterization applications to the cervix. Cervical erosion is less radically dealt with by copper ionization. Enlarged, inflamed, and everted cervical lips usually become normal in one or two months after a few applications of local ionization; some cases are hastened by a few doses of pelvic diathermy. The patient does not require to lie up, but can continue at work during the course of treatment. On Christmas Day the *Lancet* published my conclusions on the electrical treatment of pruritus and eczema vulvae; in that article I describe a case sent to me by a leading gynaecologist who had been consulted as to the advisability of amputation of the cervix. This patient had had pruritus for many years, caused by a slight clear discharge. For this the cervix had been so severely treated with coagulating diathermy that it had become hard, like wax. As the discharge remained unaltered it was evident that it originated from above the cervix. Only after many attempts did I succeed, by using the negative pole and vaginal diathermy, in passing an electrode through the hardened canal into the body of the uterus. Intra-uterine ionization arrested the discharge, and at the same time the dysmenorrhoea was cured for good.—I am, etc.,

London, W.1, Feb. 15.

AGNES SAVILL.

Temporary Sterilization by X Rays

SIR,—It would appear from Dr. Louisa Martindale's letter in the *Journal* of February 19 (p. 419) that the only, or at any rate the most important, disadvantage of temporary sterilization by x rays for contraceptive purposes is the uncertainty of the duration of the sterility. This is far from being the case. There are two much more serious objections to this form of treatment, which in my opinion render its use totally unjustifiable in healthy women, at any rate in the second and third decades. The first of these is the fact that every successful sterilization, whether temporary or permanent, is followed by more or less severe menopausal changes. Of these the well-known vasomotor symptoms are only the least important, the psychological changes, though less obvious and more insidious in their development, often leading to great and prolonged unhappiness. The psychological changes are the more marked the younger the patient, and I agree that they become quite slight after the age of 35 or so, but even then I submit that their production is unjustifiable in a healthy woman.

The second objection is the possibility of injury to the germ cells resulting in abnormalities in the children born after recovery from temporary sterilization. It is true that a large number of children, born to mothers who have been temporarily sterilized, have been investigated and no undue incidence of abnormality observed. It should, however, be remembered that in animals abnormalities may not appear until the second and third generation, and such investigations cannot be regarded as complete until at least two further generations have been observed.

My own view is that x-ray or radium sterilization should not be carried out below the age of 38 except as an alternative to oophorectomy or as a life-saving procedure for severe and persistent functional haemorrhage. This excludes its use below this age, not only as a contraceptive measure but also in operable fibroids.—I am, etc.,

London, W.1, Feb. 21.

WALTER M. LEVITT.

Contraceptives and Fertility

SIR,—It is emphatically contrary to the experience of the Constructive Birth Control Society's clinics that sterility is engendered by the use of the contraceptives they advise. It is not the practice at these clinics to teach the patient to put a soluble pessary *within* the cap next the cervix but merely to place it in the vagina, nor is jelly put in or around a cervical cap. During the preliminary examination of the patient, should any factor be noted which suggests there will be difficulty in conception she is told of it and advised to consider founding her family first and use contraceptives later, as should she prove to be sterile she might incorrectly attribute to contraceptive methods her inability to conceive.

It is noteworthy that patients who have failed with their contraceptive appliances—that is, become pregnant—nearly always admit to the omission of one or both of the prescribed precautions on some occasion because they "thought once wouldn't matter," whereas if they acquired sterility through the habitual use of their contraceptives this reasoning would hold good.—I am, etc.,

London, W.1, Feb. 19.

E. FISHER, M.D., D.P.H.

SIR,—The statement that "the use of contraceptives early in marriage is inimical to pregnancy" is one of very great importance, both to the individual practitioner who

fronting their medical colleagues. However long and arduous its labours, such a committee will have been worth while if it eventually produces recommendations acceptable to the trade and to the medical profession.—I am, etc.,

St. Albans, Feb. 10.

TOM HARE.

Why "Post-anaesthetic" Pulmonary Complications?

SIR,—I have read Dr. G. R. Osborn's article (*Journal*, February 5, p. 279) with pleasure, and I hope some little profit, but I cannot accept all his assumptions, and I should like to question one of them in particular. He states early on in his paper that "inhalation anaesthesia does not predispose to pneumonia unless there is pre-existing lung disease." Apparently the surgeon is asked to take most of any blame which may be going, although, of course, in 95 per cent. of cases we do not wish to place the pneumonia to the credit of either party.

I submit, however, although I may be behind the times and old-fashioned, that inhalation anaesthesia still has a lot to do with pneumonia following operation. Cases of chest trouble, varying from a slight bronchial catarrh to actual consolidation, are often seen in healthy subjects whose chests were beyond reproach before an anaesthetic was administered.

If the surgical procedure is the main cause of post-operative pneumonias, how is it that some anaesthetics, such as ether, are more liable to cause such complications than others? Any inhaled irritant gas is a potential cause of lung disease, with pneumonia as a climax, and though chloroform, ether, nitrous oxide, and similar gases are obviously not as potent as chlorine, I for one would hesitate to regard them as above suspicion. I should imagine that any gas which irritates the lung alveoli, as inhalation anaesthetics do, is a powerful factor in causing trouble, and that any gas so used, since it is a mild poison, reduces the vitality, which in itself predisposes to pneumonia. If Dr. Osborn would alter his categorical statement to a fifty-fifty basis I might agree with him, but really we should not expect chloroform—a chlorine compound—to be above reproach in cases in which the lung tissue is concerned.—I am, etc.,

Woodley, Cheshire, Feb. 14.

J. G. BENNETT, M.D.

Technique of Blood Transfusion

SIR,—I was interested to read "Recipient's" letter in the *Journal* of February 12 (p. 363), since it raises the important question as to the quantity and strength of citrate solutions used in blood transfusion. At present I am engaged in studying the effect on blood of different amounts of citrate, and also as to whether it is the ideal anti-coagulant. Although final conclusions have not yet been reached, there is ample experimental evidence to show how important it is that the citrate solution should be isotonic (3.8 per cent.) and added accurately, in the proportion of 10 c.cm. to each 100 c.cm. of blood, at the time of collection. In making transfusions free from reactions there are undoubtedly other factors concerned, some details of which I hope to publish in due course.—I am, etc.,

Norwich, Feb. 15. W. R. THROWER, M.D., M.R.C.P.

SIR,—In the *Journal* of January 29 (p. 241) Dr. H. F. Brewer describes the technique of blood transfusion using the interrupted method of withdrawing blood into a flask, citrating, and injecting into the recipient. From personal experience with the direct method I can recommend a far simpler technique, and a safer one as regards contamination. Further, cutting down for a vein is

eliminated unless the recipient is so dehydrated as to be in *extremis*.

The materials required are an Unger machine and two large-bore needles, each having a circular shield at the hilt. The machine can be made immobile by tightening it on to the edge of a board, like a vice, the board lying transversely between donor and recipient for the support of their arms. A tourniquet is applied and the needles are inserted into the veins, the circular shields holding them in position. Rubber tubing connects the needles to the machine, which has four outlets. The remaining two outlets are for 20-c.cm. Record syringes, one for blood, the other for saline. By rotating the stopcock to the donor, the operator fills his syringe with 20 c.cm. of blood, gives a twist to the stopcock, and the blood is then injected into the recipient's vein. In order to keep the entire machine clear and to prevent clotting, about 20 c.cm. of saline are injected by the assistant, slowly, from the other syringe. In a 500-c.cm. transfusion about 20 c.cm. of saline will be used. I have never seen blood clot in the barrel, but as a prophylactic ether can be sprayed on the syringe. The entire routine is simple, there is no possibility of contamination, and the site of venepuncture heals in a day, leaving no trace. Also, the time is necessarily prolonged, a factor to the patient's advantage. I am certain that given a fair trial this method will meet with the approval of the profession.—I am, etc.,

Edinburgh, Feb. 12.

NORMAN L. FREUND.

Hysterical Dermatitis

SIR,—Dr. Henry MacCormac's paper on autophytic dermatitis in the *Journal* of December 11, 1937 (p. 1153), prompts me to record the following two cases of self-inflicted dermatitis.

CASE I

This patient was admitted to Queen Charlotte's Hospital on November 11, 1937, for her second confinement. Her case was complicated by rheumatic mitral stenosis, well compensated. On November 13 the patient drew the nurse's attention to a single oval lesion on the lower and innermost quadrant of the right breast. The lesion was half an inch long, irregularly oval in shape, with erythematous base and outline and central superficial slough comparable to a second-degree burn. Close inquiry revealed no possibility of extraneous heat or irritant so far as could be ascertained: no fomentations had been applied. The lesion was treated with calamine lotion. On November 14 similar lesions were present on a circular plan, arranged around the areola, identical with the primary. On November 15 no further lesions were found on the right breast, but three identical lesions were present on the left breast. The rapid appearance and the character of the lesions raised the suspicion of a chemical irritant, but none could be incriminated. On this date the patient in the next bed was reported to have a similar lesion on the right buttock.

No definite abnormality of the nervous system could be detected, apart from increased tendon reflexes, absent palatal reflex, and an indiscriminate distribution of blunting of sensation to pin-prick, mostly on the upper arm and calves of legs.

CASE II

This patient had a normal pregnancy and puerperium. Four lesions, roughly oval in shape and arranged in a linear manner, were seen on the right buttock, with faint scratch excoriations in the intervening area. No further lesions were noted. Examination of the central nervous system exhibited increased tendon reflexes, absent palatal reflex, and typical glove-and-stock distribution of anaesthesia to pin-prick, extending up to a hand's breadth above the knees and just below the elbows. Dermographia was particularly marked.

Dr. MacCormac kindly consented to see the patients, and said the cases were evidently self-inflicted lesions,

for treatment. On the last occasion she was unconscious for ten hours after taking 10 grains of this drug.

Another important point is that all rhinologists do not yet realize that it is disastrous to remove polypi in an asthmatic subject who is aspirin-sensitive. The question as to when to operate for the removal of polypi in asthmatic subjects has been clearly discussed in a paper by Clement Francis in the *Practitioner* of September, 1929. I have seen many cases in which such patients have become asthmatic wrecks as a result of having polypi removed, and the more complete the operation the more desperate does the asthmatic condition later become. In your article you quote H. F. Buchstein and L. E. Prickman as stating "there was a high incidence of nasal polypi in patients extremely sensitive to aspirin." I am convinced that in all asthmatic subjects who are sensitive to aspirin there is a "nasal polypus element." No polypi may be apparent at first, but in such cases polypi invariably show themselves after a time.—I am, etc.,

London, W.1, Feb. 13.

ALEXANDER FRANCIS.

Infantile Pyloric Stenosis

SIR,—I have read with interest Dr. J. Vernon Braithwaite's article on the treatment of pyloric stenosis (*Journal*, February 12, p. 334). In 1936 I published a consecutive series of fifty cases of pyloric stenosis treated at the Infants' Hospital with a mortality of 2 per cent. (*Post-Grad. Med. J.*, 1936, 12, 414).

The one death was due to a streptococcal infection which had nothing to do with the operation. I cannot agree with Dr. Braithwaite that eumydrine is the treatment of choice for pyloric stenosis, for the following reasons: (1) the operation for pyloric stenosis performed according to the technique I have previously described is one of the safest operations in surgery; (2) it is performed without previous preparation of the patient, and the duration of the child's stay in hospital need only be three to five days, recovery being rapid and uneventful.

Eumydrine necessitates a prolonged period of medical treatment and hospitalization, which last is very fatal to young babies. Quite apart from the pyloric stenosis for which the patient was admitted, mere hospitalization of a baby for a period of two and a half weeks, the shortest time, to twelve weeks, the longest time, mentioned by Dr. Braithwaite as necessary to cure pyloric stenosis by medical treatment alone carries with it a very definite mortality. Some babies treated by eumydrine fail to respond, and either die or come for operation in a half-starved and emaciated condition. Although I think a baby is never too ill to be operated upon for pyloric stenosis, I feel that it is definitely dangerous to starve young babies for long periods, even as part of medical treatment.—I am, etc.,

London, W.1, Feb. 14.

DAVID LEVI, M.S., F.R.C.S.

Trauma and Progressive Muscular Atrophy

SIR,—The correspondence on Dr. G. E. Frederick Sutton's interesting case (*Journal*, January 29, p. 225) prompts me to call attention to Speransky's researches into the results of trauma to the nervous system (1935, *A Basis for the Theory of Medicine*, New York). He showed that after a standardized trauma to the nervous system in dogs certain trophic lesions developed. Not every animal so injured developed the lesions to the same degree; the subjects classified themselves into six groups: (1) rapidly fatal result; (2) illness followed by death; (3) illness followed by recovery and then relapses occurring

at regular intervals; (4) illness followed by recovery; (5) no illness, but on a further trauma ("second blow") illness followed by death; (6) no tissue changes and immunity to further traumata. These variable results, following carefully standardized experimental procedures, demonstrate that there are, at least in dogs, a series of types of nervous constitutions. As progressive muscular atrophy does not invariably follow traumata, it appears reasonable to suppose that the patients developing it after trauma inherit a nervous system predisposed to this type of disorganization. These cases may be compared with those patients exhibiting general neurological manifestations following spinal anaesthesia (Critchley, 1937, *Medical Annual*, p. 33).

Dr. R. G. Abercrombie's cases of poliomyelitis following fractures (February 12, p. 359) are probably examples of the "second blow"; occurring during an epidemic, they were probably suffering from a latent virus infection of their nervous systems, which the second blow of the fracture precipitated into a full-blown infection. Corresponding experiments have been described by Speransky. Two members of his team induced in cats a mild form of tetanus by injecting tetanus toxin into the eye. After a mild illness eight out of nine cats recovered. Five days after spasmodic symptoms could no longer be elicited, a "second blow" (injection of bile into a sciatic nerve) was inflicted. The animals developed generalized tetanus, the relapse taking a more pronounced form than the original illness; practically all the animals died. I believe Speransky has presented convincing evidence that such injuries to the nervous system set in train a dystrophy of the nervous system which may have widely different results, depending on the individual nervous constitution.—I am, etc.,

Bristol, Feb. 14.

FRANK BODMAN, M.D.

Correct Footwear

SIR,—From your annotation (February 5, p. 290) and the preceding correspondence it would appear that the following conclusions command general agreement: (1) that "incorrect" footwear causes a large amount of physical and mental disability; (2) that these disabilities are preventable and, when established, to some extent curable by "correct" footwear; (3) that something should be done in collaboration with the boot-and-shoe trade to encourage the public to adopt "correct" footwear; and (4) that a committee composed of medical and trade representatives might be set up to make a comprehensive study of the problem, including the accurate definition of "correct" and "incorrect" footwear.

Rational folk of my acquaintance know what they mean by "correct" footwear—namely, boots, shoes, slippers, etc., which serve the wearer's purpose without causing him (or her) any mental or bodily disability. Such footwear is made by at least one firm of manufacturers in this country, though it is sold only by certain, and a limited number of, "untied" retailers at prices beyond the means of many people.

From the private correspondence received since the publication of my former letter (December 25, 1937, p. 1302) it would appear that many doctors are deeply concerned at the prevalence of the "tied" retailers in their district, and at the difficulty of obtaining "correct" footwear now that the craftsman in his own business is almost a relic of the past. These observations, and the question of price, suggest to me that the representatives of the trade on any committee of inquiry which might be set up (and this would appear to be desirable) would be up against a far more difficult problem than that con-

But apart from all this, surely ordering purgative treatment in bacillary dysentery is breaking one of the most sacred basic laws of sound therapeutics? Is it not definitely stimulating an inflamed organ—as bad a crime as exercising an acutely inflamed joint, for instance, or giving diuretics to a case of acute nephritis? The patient and the patient's bowel obviously need to be given rest with opium and belladonna, so that the ulcers can be given time to heal and specific treatment—for example, with bacteriophage—can have a chance to work.

In my experience results obtained by this method are sometimes almost spectacular, and nearly all cases seem to respond far more rapidly than those that are given frequent purges.—I am, etc.,

Calcutta, Feb. 15.

FRANK MCCAY.

Acute Appendicitis

SIR,—With reference to the article of Dr. A. M. Spencer on the aetiology of acute appendicitis in the *Journal* of January 29 (p. 227) the following case history is worthy of record.

The patient was a male cook aged 34. Five months before operation for appendicitis on January 19, while he was trying to inflate the subcutaneous tissue of a sheep through a cut in the skin of the leg, to facilitate skinning the carcass, he felt that he swallowed some of the hair. A few months later he had an attack of severe colicky pains all over the abdomen, which subsequently localized in the right iliac fossa. The attack was accompanied by nausea but no vomiting. There was a rise of temperature. The clinical examination some days after the attack revealed an appendicular mass. Operation was performed six weeks later.

The pathological report of the specimen, by Dr. Anise Onsi Bey from the laboratories of the Ministry of Health, was: "Purulent appendicitis; appendix contained foreign matter (hairs) in the lumen and also embedded in the tissue under the mucosa, showing distinct reaction around the hairs."

Demerdache Hospital, Cairo, Feb. 11.

H. STIVEN.

The Radiologist's Range of Service

SIR,—I am in entire agreement with Mr. H. Osmond Clarke (*Journal*, February 5, p. 310) when he says:

"But a radiologist has neither the special training nor the wide experience which enables him to speak with authority on clinical end-results. . . . Thus it is quite unfair to him and to the patient that he should be asked to express any opinion on the treatment of a fracture."

In reply to this letter the writer who hides behind the hieroglyphic B.M./MC5W (February 19, p. 422) says:

"I would like to point out that in fact a radiologist does see patients at all stages, and that he sees at least as many films as the rest of his hospital staff put together and, supposing that he has any intelligence at all, he gets a very good idea not only of the efficacy of various surgical performances but also of the judgement and ability of the surgical performers."

Now I am quite prepared to believe that this writer sees x-ray films of fractures at many different stages, including the time when firm union has occurred. After this it is rare for further films to be taken, but it is not until after this that the end clinical result is obtained. The writer apparently judges the result of a fracture by the radiographical appearance, forgetting that the functional result is what really counts. This is a pity and the very reason why radiologists' advice on the treatment of fractures should not be sought, especially when every effort is being made to teach our students that good function is the most important thing in the treatment of fractures.

Dr. F. Hernaman-Johnson in the same issue (February 19, p. 422) appears to imply that a general practitioner, before calling in a consulting surgeon in a fracture case, should talk the matter over with a radiologist. Radiologists give invaluable help in the diagnosis of fractures, but why they should be consulted in the matter of treatment I cannot imagine. Surely it is better for a general practitioner to talk things over with a fellow general practitioner.—I am, etc.,

London, W.1, Feb. 19.

JOHN HOSFORD.

The Problem of the Final M.B., B.S.Lond.

SIR,—The problem of the M.B., B.S. of London University is weekly becoming more and more the problem not only for the members of the Conjoint Board but for every member of the medical profession who is not a holder of the London M.B. We cannot afford to tolerate the exaltation of this degree at the expense of other qualifications. For weeks I have been awaiting the onslaught of the offended legions upon its haughty holders. How much longer must I wait?

Comparisons are odious, but if made at all should be made for all, at least when made in public. What a pretty picture a comparative table of the merits of all the university degrees would make! But it would not be "cricket," nor does it seem to my humble intelligence to be "playing the game," to allow invidious comparisons between the London M.B. and the M.R.C.S. to appear in a public journal, and still worse in one which is supposed to be upholding the interests of the whole of the medical profession. It would seem that the object of the "highbrows," apart from enhancing their own prestige, is to make it more and more expensive and difficult for middle-class parents to provide their children with a livelihood. The birth rate is falling, and they wonder why! If they honestly think that ever-rising standards of education are in the best interests of the race I would ask them to think again, and think earnestly and disinterestedly.

The time has arrived to put a stop to the "cut-throat" competition to add to our names letters which at present mean little to the public but may soon mean so much that they will demand nothing less than an F.R.C.S. for first-aid work. We don't want to become "sandwich men" with honour degrees on strike for refuse collectors' wages. Qualifications which satisfy the General Medical Council should satisfy all and no additions should be encouraged. If advertising is undesirable in any form it is more so in this form.

Is it really right to deprive children of the joy of childhood and to fill their lives with work and worry? Are examinations in their present form the best means of detecting and rewarding the best citizens or are they merely or mainly detectors of a retentive memory and little else? Has the time not arrived to assess and give credit for other and more important qualities and to reduce the time spent in accumulating facts mostly forgotten or out of date when they are wanted? Finally, when is "boosting" the London M.B. not advertising?—I am, etc.,

Gosport, Feb. 3.

G. W. FLEMING.

SIR,—I have followed keenly the letters concerning the problem of the final M.B., B.S.Lond. It seems to me that the opinion of the young graduate should be voiced.

In defence of the young practitioner I would like to reply to Dr. C. S. Staddon's letter in the *Journal* of February 5 (p. 309). If, as has been stated, a fair number

probably inflicted by a combination of acid irritant and nail trauma. On his advice the lesions were treated with flavine and paraffin and the patients were impressed with the importance of leaving the lesions strictly alone. After application of flavine the lesions healed with great rapidity.

The first patient was seen on December 1, 1937, and all the lesions were covered by a firm scab. No further lesions had appeared. The second patient did not report for inspection, but on inquiry the lesions were said to have healed.

No definite irritant was incriminated, but the patients had access to dettol 1 per cent. solution, and a lysol jar in which forceps were kept was normally placed on a table between the two beds.

I wish to record my thanks to Mr. Carnac Rivett for permission to publish these cases and to Dr. H. MacCormac for his help in the diagnosis and treatment.—I am, etc.,

London, S.E.5, Feb. 1.

O. LLOYD, M.B., B.S.

Referred Pains arising from Muscle

SIR,—I read with much interest Mr. J. H. Kellgren's article on this subject in the *Journal* of February 12 (p. 325). By combining Dr. T. Stacey Wilson's mallet method of dealing with nodules with a previous injection of novocain into the fibrositic masses I have obtained results similar to those of Mr. Kellgren. The amount of novocain required is much less, the average dose being from 2 c.cm. to 5 c.cm. The results are immediate, and although I have not yet used this treatment for long and the number of patients is small, there has so far been no return of the pain.—I am, etc.,

Cheam, Surrey, Feb. 15.

STUART GOLDHURST.

Recovery in the Spinal Cord

SIR,—My letter (February 5) was not intended to express dissatisfaction with Dr. J. Purdon Martin's statements, as I was unable to attend his lecture, but to correct the impression which the report gave. As he now makes clear (February 19) the "rightful position" of interference with the circulation is "on an equality with, not subordinate to, damage to the structure of the cord." Dr. Martin adds that "ischaemia is at most only the means by which more primary factors exert their influence," nevertheless its treatment by every method at our command is theoretically important and clinically urgent.—I am, etc.,

Northfield, Birmingham, Feb. 21.

F. A. PICKWORTH.

Dangers of Immune Globulin

SIR,—The prevention or modification of measles by the use of convalescent or adult serum is now established as a useful procedure; but the inconvenience of preparation and the absence of a commercial supply have probably led medical men to show interest in the preparations of immune globulins, prepared from placenta, which are now on the market. These are represented as affording the means of complete control of measles infection, and are recommended by the makers for universal use, with very little insistence on unpleasant results from their use.

A limited experience of these products has been sufficient to show me that there are disadvantages associated with them of which other practitioners may be as ignorant as I was myself. The circulars of the manufacturing chemists, which provide us general practitioners with our postgraduate instruction in therapeutics, cannot be expected

to do anything but minimize the drawbacks of the preparation advertised; but to describe the possible reactions produced by placental extracts as "local irritation and also rise of temperature, with malaise, in some subjects," is apparently an understatement. Two recent patients of my own who were given doses appropriate to their ages according to the maker's recommendation suffered from such serious collapse as thoroughly to alarm both the parents and the medical attendant and to make them feel that the cure was worse than the disease. Within an hour of the injection the patients vomited, and when I saw them were lying in a condition of semi-coma, cold, pale, and almost pulseless; this condition lasted about two hours and was followed by pyrexia, with such pain at the site of injection and down the leg as to prevent sleep far into the night. Next day there was still slight fever and considerable pain, though both patients had obviously recovered.

We are accustomed to feeling secure from serum-sickness and anaphylaxis when using convalescent serum, and I feel that my experience, though perhaps exceptional, is worth recording as a warning that placental extracts cannot be used quite so light-heartedly.—I am, etc.,

Wimbledon, Feb. 20.

GARETH A. EASON.

Coproliths and Appendicitis

SIR,—In the issue of January 29 (p. 227) Dr. A. M. Spencer stresses the importance of coproliths in the aetiology of acute appendicitis, apparently on account of the 70 per cent. incidence in what appears to be a series of twenty cases. In a consecutive series of 528 appendicectomies I found the incidence of coproliths to be as follows:

In 47 incidental appendicectomies during operations on other viscera, six instances—12.8 per cent.

In 198 indubitably acute cases (where perforation, gangrene, or an abscess was present), eighteen instances—9 per cent.

In 114 cases where the appendix was found not to be the cause of symptoms, fourteen instances—12.3 per cent.

In 169 chronic cases, twenty-seven instances—16 per cent.

While coproliths therefore seem to me aetiologicaly unimportant, their presence may often determine the site of ulceration and perforation in acutely inflamed appendices.—I am, etc.,

London, Feb. 14.

MALCOLM BAILLIE, F.R.C.S.

Treatment of Bacillary Dysentery

SIR,—I have read the article and letters on bacillary dysentery that you have recently published with interest, as I see a great many cases here in Calcutta and have had a Flexner infection myself.

I am certain that the old purgative treatment—giving drachm doses of magnesium and sodium sulphate every four hours or so until the stools become almost completely watery—is wrong. In mild cases, with the patient complaining of abdominal pain and tenesmus and of having a stool, say, every hour, symptoms are made worse, and in severe cases, especially in old people, it is terribly drastic. Most authorities now agree, moreover, that although this treatment flushes the bacteria, toxins, blood, and pus from the lumen of the large intestine, and although it may reduce the oedema of the mucous membrane, it does not alter the course of the disease appreciably. I think that patients can usually be left to get rid of the contents of the large bowel themselves, although some may require a very light dose of salts at one stage or another of the disease process.

house-surgeon to the Adelaide Hospital, Dublin, and later he served as surgical clinical assistant at the London Hospital. At Littlehampton he built up a successful practice and held the appointments of surgeon to the Littlehampton Hospital, Arundel Hospital, and the West Sussex County Mental Hospital. He had been visiting surgeon to the Graylingwell War Hospital and medical officer in charge of Slindon House Red Cross Hospital, and was latterly consultant surgeon to the Arundel Hospital. He had been a member of the British Medical Association since 1891.

Rear-Admiral CARY T. GRAYSON, M.D., chairman of the American Red Cross and of the International League of Red Cross Societies, died in Washington on February 15 at the age of 59. The son of a Virginian doctor, he had a most distinguished career in the service of the U.S.A. Government until his retirement from the Navy ten years ago. He had been the medical attendant and intimate friend of three Presidents of the United States—Theodore Roosevelt, William Howard Taft, and Woodrow Wilson.
